Extensive research has illuminated many aspects of the emergence of the Eastern Agricultural Complex, yet gaps remain surrounding the origin and spread of these early domesticated plants. The long-term goal of our research is to create a comprehensive, online database of accurately dated EAC plant samples similar to the Ancient Maize Map project (Laboratory of Archaeology, University of British Columbia). Compiling this chronology will contribute to our understanding of the social, economic, and ecological consequences of plant domestication in this region and highlight where additional research is needed. We have begun by compiling all known instances of four early domesticates (goosefoot, maygrass, marsh elder, and sunflower) in Kentucky and surrounding states. We describe our database project, provide summary information for the Kentucky region, and discuss future plans to increase the regional scope.

Hundman, Brittany (East Tennessee State) and Jay Franklin (East Tennessee State University)

[241] *Crocks and Canning: Economics of Homesteading on Boone Lake*

Situated at the confluence of the industrial North and the agricultural South, the rural Appalachian Mountains of east Tennessee had unique access to a variety of material and agricultural goods. These resources were key to the practice of homesteading; a type of small-scale subsistence living that was a mechanism not only for survival but of familial and communal pride that continues to this day. Boone Lake, formed from the damming of the Holston and Watauga Rivers, has covered many early occupation sites from this region. Surface survey along the lake periphery and riverbanks indicates historical occupations beginning as early as the late 1700s, continuing until the mid-1900s. Examining the distribution of artifacts from these disturbed sites by material type proportions and temporal spans will shed light on occupational patterns and social dynamics for this underinvestigated region. The composition of the glass and ceramic assemblages will investigate food preservation patterns, availability of consumable resources, and household economics. Self-reliance and sustainability are continued cultural traditions in this mountainous region and would have played a major role in the maintenance of an autonomous homesteading household.

[137] *Radiocarbon Dating of Land Snail Shell and the Chronology of MSA-Neolithic Human Activity in the Haua Fteah, Libya*

Land snails have a radiocarbon ecology which leads to offsets in shell radiocarbon age, relative to contemporary biogenic carbon. We describe new methods for evaluating and calculating this offset. We radiocarbon date and apply the new methods to land snail food debris, from the deep MSA to Neolithic sequence in the Haua Fteah cave, NE Libya. Oxcal modelling of the resulting 136 dates over ~45000 years shows the site was used for short episodes separated by long periods of abandonment. The archaeological record had suggested continuous activity. The record in this, and similar sites, needs reassessment in this light.

[156] *Prepared Floors on Mound A Revealed through Near-Surface Geophysics*

Mound A is the largest earthen construction at Poverty Point and the second largest mound in North America. Limited excavations on the mound have documented the construction history of the deposit, but have failed to find evidence of how the mound was used. Recent geophysical surveys (including resistivity, ground penetrating radar, and magnetometry) reveal specialized use areas—including prepared floors that we interpret as dance and presentation platforms. The discovery of these platforms suggests that the mound was not simply an earthen pile, but rather a focal point for ritual gatherings whose height allowed greater visibility of activities taking place on it. The successful application of geophysics on Mound A also highlights the applicability of near-surface geophysics as a technique for better understanding other earthen construction at Poverty Point and elsewhere.

Hunter, Carly

[241] *The Last Ones Out: The Impacts of the National Park Service on the Inhabitants of Cataloochee Valley, NC*

This poster will highlight the benefits and drawbacks associated with the establishment of the National Park Service in western North Carolina. Specifically focusing on the Cataloochee Valley of the Great Smoky Mountains National Park, the implementation of government regulations both culturally and geographically affected the region in ways that did not always align. Some of these programs actually disenfranchised the local population, but simultaneously supplied the federal protection that has provided a means by which the public can enjoy the land for years to come.

Hunter, Raymond (University of Chicago)

[297] *Cultivating Ideology: Food Production in Colonial Cusco, Peru*

Historical and archaeological research on the Colonial Andes and Spanish colonialism more broadly has drawn parallels between the conversion of indigenous populations to Catholicism and the conversion of agricultural land to 'Christian' food production. This scholarship contends that for colonizers, religious conversion was irrevocably connected to agricultural practice—a particular concern to Spaniards in the Andes given the strong links between agrarian production and Inka ritual practices.

Evidence from the site of Markaqocha, in the Cusco region of Peru, both corroborates and complicates arguments that link religious and ecological conversion. At Markaqocha, archaeological, historical, and paleo-environmental data provide a lens on Inka and Colonial ritual economies. These data suggest that while the intervention of religious organizations was critical to initial attempts to convert from an Inka to Spanish political ecology, the connections this process affirmed between ritual spaces and agricultural production later prompted conflict between secular and religious institutions. Further, data from Markaqocha suggest that attempts at such a conversion were not entirely successful. The data demonstrate that pre-Colonial and Catholic ritual practices have together influenced food production in the vicinity of the site through the five centuries since the arrival of colonizers in the region.

[91] *Reassessing Agricultural Potential in Chaco Canyon: Exploring the Link between Soil Salinity and Soil Texture*

Determining the soil salinity of a site can aid in the assessment of the agricultural potential of a particular area, thus enabling researchers to draw conclusions about the potential for cultivation and subsistence intensification. Studies pertaining to soil salinity in Chaco Canyon often argue that the electrical conductivity (EC) levels within the area—a standard proxy measure of soil salinity—were too high for maize farming in many areas of the canyon, drastically limiting the potential agricultural yields within the canyon. These findings influence interpretations of the canyon's social and economic structure, as well as reconstructions of population size. A recent reanalysis of salinity counters earlier studies, suggesting maize agriculture was possible in large portions of the canyon. We reexamine the implications of soil salinity research through an assessment of the relationship between texture and salinity within the "dune dam" area located just below the great house of Peñasco Blanco. Two cores from this portion of Chaco Canyon will be compared with previously published data from the well-studied Gila Basin pertaining to salinity and agricultural potential. Through this comparison, we will explore the interconnection between soil texture and salinity and its implications for broader agricultural patterns within the Southwest.

Huntley, Deborah (Tetra Tech, Inc.) and Suzanne Eckert (Arizona State Museum)

[287] *The Reshaped Sherd: A Comparative Study of Ancestral Pueblo Worked Sherd Assemblages*

Every site has at least one: the worked sherd. Game piece? Scraper? Spindle whorl? Miscellaneous ceramic object? Different analysts categorize these easily recognized but not always easily interpreted artifacts in different ways. In this presentation, we examine worked sherd assemblages from three 13th-15th century Ancestral Puebloan villages. Differences among these assemblages attest to variable contexts of use and meaning for worked sherds. We argue that individual worked sherds should be understood within a larger framework of worked sherd assemblages, and suggest some key attributes to consider when such objects are present in a collection.

Huo, Wei

[336] *Recent Archaeological Discoveries in Tibet and the 'Plateau Silk Road'*

In the past, the Qinghai-Tibet Plateau region has been vacant in Silk Road route studies. The northern part of the Qinghai-Tibet Plateau can be directly connected to the western region, with the Tarim Basin, Hexi Corridor, and the Loess Plateau together forming a very smooth ring. There are a number of oases connecting the desert and the Gobi, which has been considered by some as a direct connection of a Silk Road branch to the northern region of Qinghai-Tibet Plateau. The southern part of the Qinghai-Tibet Plateau is a portion of the Himalayas. It has many mountain passages, which cross-cut the northeastern region and the mountains of the Six Rivers Basin as a whole. These north-south alpine valleys have since the prehistoric period become important channels for human beings. Geographically speaking, although the Qinghai-Tibet Plateau is cold, dry and exhibits a number of conditions not suitable for human survival, it is not a restricted area. The history of the Qinghai-Tibet Plateau is very late, basically from the beginning of the Tang Dynasty, so the archaeology of the area is a good entry point toward understanding the regional civilization and cultural exchange dynamics.

[140] *Lithic Technology of Manufacturing Stone Tools at Gravel Quarry Source Locations Using Heat-Treatment*

Prehistoric flintknappers world-wide typically used heat-treatment to improve the flakeability of lithic materials after initial reduction into smaller-sized packages. In contrast, along the eastern escarpment of the Southern High Plains of Northwest Texas, Late Archaic-age (4,500–2,000 rcyBP) flintknappers used heat-treatment to improve large quartzarenite clasts prior to initial clast reduction. Heat-treatment in this case was used as part of procurement at quarry gravel source locations. These quartzarenite clasts along with other knappable lithic material occurred within large secondary gravel deposits eroded from the nearby Southern High Plains basal section of the Ogallala Formation. The Potter member quartzarenite clasts were the largest sized clasts within these gravel deposits. A surface survey at Macy Locality 313 (41GR911), a Late Archaic hunter-gatherer campsite and Potter member quartzarenite quarry workshop, documented a lithic assemblage consisting of over 3,500 pieces of lithic tools and debitage, along with hearthstones. A technological study of this assemblage examined the role of heat-treatment in the initial reduction of Potter member quartzarenite clasts. Results indicated the process of heat-treatment improved the unmodified clasts for primary reduction and produced heat fractured debitage that also was used to fashion stone tools.

Hurt, John Duncan (University of Texas at Austin)

[229] *The Cividade de Bagunte and the Problems of Castro Architecture*

It is generally accepted that the Castro Culture in northwestern Portugal exhibits a fairly consistent architectural tradition, characterized by the presence of certain construction techniques, structural forms, and organizational schemes. Despite this consensus, there is a pressing need for further research on the topic. Publications dedicated to the study of castro architecture are few, and they have mostly taken a broad approach that focuses on apparent commonalities between sites from across Galicia and northern Portugal. Authors have placed undue emphasis on singular features of the evidence from each site, overlooking the more complex and problematic questions that arise when a structure is viewed in the context of its own settlement. While these works have been effective in establishing some distinct architectural trends, their interpretive components are often oversimplified or unnecessarily speculative. Such an approach encourages tentative generalizations and contributes little toward an in-depth understanding of castro communities. This paper considers architectural evidence from the Cividade de Bagunte and a few nearby sites to demonstrate the complexity inherent in any comparative assessment of castro architecture. In short, this study seeks to raise meaningful questions while skeptically evaluating the evidence in a way that responds to the current state of architectural research.

Hurte, Sr., Guilliam (VCP Alexandria) and Gabriel Brown (VCP Alexandria)

[326] *Forensic Photography and the VCP—Teaching Veterans and Capturing History*

One of the unique opportunities given veterans within the Veterans Curation Program (VCP) is professional training in high quality digital artifact photography that far exceeds the quality of photography practiced by most Cultural Resource Management firms. A representative sample consisting of 10% of every collection processed by VCP is photographed by the veteran technicians and subsequently combined with the finalized collection. These digital images are reviewed and a selection is eventually uploaded to the Digital Archaeological Record (tDAR), an international digital repository for the records of archaeological investigations. The process of training veterans with little or no background in photography relies primarily on well-established step-by-step methods, ongoing personalized training and mentoring, and an accessible reference guide designed specifically for the VCP. With the skills and experience acquired through the VCP, many veterans have discovered the value of photography not only as a therapeutic and satisfying hobby, but also as a possible career choice.

[117] *Preliminary Understandings of the Casma's Response to Chimú Conquest in the Nepeña Valley, Peru: Findings from the 2017 Pan de Azúcar Excavations*

Around A.D. 1300, the Chimú conducted a series of expansions south of the Moche Valley conquering the Casma, a regional group whose territory spanned from the Chao to the Huarmey Valleys. While past research has examined this event in the northern and southern extent of the Casma's territory, there exists a void in our knowledge on the Casma's experience during the Chimú conquest in the central Santa and Nepeña Valleys. In 2017 the Proyecto Investigación de Arqueología de Pan de Azúcar (PIAPAN) conducted the first season of excavations at the principle Casma site of Pan de Azúcar. The project's goals are to understand the Casma's response during the Chimú conquest in whether they conformed, resisted, or hybridized their daily practices through taking a multi-component analysis of cultural and biological data. Based on findings from the first season of excavations at Pan de Azúcar, this paper discusses the data discovered and presents preliminary hypotheses on how the Casma reacted to Chimú conquest in the Nepeña Valley.

[257] *Being Matlatzinca: Ethnicity and Household Activity at Aztec Calixtlahuaca*

In written sources, the Mexica provide stereotyped descriptions of other groups, many of whom had been conquered and incorporated into the Aztec Empire. I use data from the site of Calixtlahuaca to evaluate the archaeological validity of such stereotypical practices for one group, the Matlatzinca. In particular, I focus on the heavy reliance on maguey, and locally distinctive foodways relating to maize. I then consider whether these practices became more or less pronounced once the area came under Triple Alliance rule. I find that there is a modest shift toward more characteristically Aztec practices in both activities over time, but that these changes are highly unevenly distributed among households. Given that both of the activities under consideration are relatively low-visibility, household-level practices, it is unlikely that they were specifically targeted by Aztec imperial policies. This suggests that shifts toward more Aztec practices were largely voluntary actions by particular subgroups of the local population.

[189] *Zooarcheological Contributions to the Smithsonian's National Taphonomic Reference Collection*

Taphonomy, the study of how organisms fossilize and information that is lost and gained along the way, has emerged as pivotal to reconstructing the paleoecology of animal communities and ancient human lifeways. Through taphonomic analysis, we can decipher the sources of bone accumulations at paleontological and archaeological sites and the processes involved in bone modification and preservation. Such inquiries rely upon well-documented reference collections that link certain bone modifications to specific taphonomic agents, processes, and ecological contexts. Here we introduce two major additions to the Smithsonian's National Taphonomic Reference Collection (NTRC), consisting of roughly 5,000 taphonomic specimens assembled by two of us (Gifford-Gonzalez and Haynes), during many decades of experimental, ethno-archaeological, and landscape-scale taphonomic research in North America and Africa. The taphonomic significance of each specimen has been meticulously documented using original field notes, photographs, and inventories, in a searchable online database. The NTRC is the first global taphonomy repository and is designed to grow with future additions of modern and fossil bones that document known or inferred taphonomic processes. The collection can be accessed digitally and/or through examination of the actual specimens at the museum. We encourage archeologists, paleoanthropologists and paleontologists to utilize this valuable comparative resource.

Hutson, Scott (University of Kentucky)

[109] *Creations of the Lord: New World Slavery and Sacrifice*

In the ancient cities of Ur and Chan Chan, excavations revealed that when a lord died, dozens of servants were sometimes put to death and buried with the lord. Such examples of retainer sacrifice, also mentioned for Aztec kings and documented in Maya tombs, raise questions about slavery, violence, and subjectivity. David Graeber has argued that slavery played a key role in the origin of commercial systems. The transition at issue concerns the melding of human economies (which make and remake relations between people) with commercial economies (which concern the acquisition of goods and wealth). Social currencies power human economies, but such money can never substitute for a person because each person and their relations are unique. Sufficient violence, however, can reduce a person to mere property, a slave. In a well-known passage from Phenomenology of Spirit, Hegel states that the bondsman (the slave) has no consciousness of own: his/her essential nature is to live for the lord. Some aspects of captives and human sacrifice in the New World accord well with Graeber's and Hegel's position, yet there are salient differences. This paper explores these discrepancies and considers their consequences to a relational approach.

Hyche, John (University of Maryland, College Park)

[296] *Shanties on the Mountainside: A Look at Labor on the Blue Ridge Railroad*

From 1850 to 1860, the Blue Ridge Mountains were home to roughly 1,900 Irish laborers as they worked on the construction of the Virginia Central Railroad. Upon its completion, the railroad stretched from Norfolk, Virginia, to the Ohio River. Along the Blue Ridge Mountains, the Irish immigrants constructed several cuts and tunnels, including the Blue Ridge Tunnel. At its completion, the tunnel measured 4,263ft long and bridged two Virginia counties. This project proved to be an especially daunting task that took ten years to complete and cost many lives. Workers and their families nearby were forced to live in groups of shanty homes, prone to regular outbreaks of disease throughout construction. In 2011, a local non-profit organization, focused on pinpointing the remains of these Irish shanty homes, contacted the University of Maryland to see if an archaeological survey could aid their search. Over the course of two years, archaeological research shed light on the material culture of transient labor and reinforced strong community ties related to the surrounding cultural landscape. The aim of this paper is to evaluate the archaeological evidence collected and determine if the data conclusively points to the existence of shanty settlements at the two sites investigated.

Hyde, David (Western State Colorado University)

[142] *Elite Maya Social Identity at a Hinterland Community: The View from Medicinal Trail, NW Belize*

Social identification is the perception of oneness with, or belongingness to, some human aggregate. The definition of others and self is largely relational and comparative. Archaeologists demonstrate Maya elite identity by comparing them to non-elites in terms of energy expenditure in burial preparation,

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

house and platform construction, access to luxury items, and cranial and dental modifications. Although non-elites include some urban residents and all hinterland residents, this study proposes that some hinterland residents also identified as elites. The Medicinal Trail Community is a hinterland settlement with considerable variation in household complexity, ranging from simple perishable structures informally arranged, to households on elevated platforms formally arranged around a courtyard. The latter residents attempted to adopt the social identity of the urban elites by using the symbols and material culture of the "Urban Elites," therefore becoming "Hinterland Elites." As a result, these "Hinterland Elites" economic and socio-political status was elevated above most of the community's inhabitants, providing them with limited social power. Although their elite identity was probably not acknowledged by the urban centers, by distinguishing themselves from those in their immediate community, they used this identity to gain and maintain power within the community.

[56] *Water, Ritual, and Prosperity at the Medieval Capital of Bagan, Myanmar (11th to 14th Centuries CE): Preliminary Exploration of the Tuyin-Thetso "Water Mountain" and the Nat Yekan Sacred Water Tank*

The IRAW@Bagan project is aimed at developing an integrated socio-ecological history for residential patterning, agricultural practices, and water management at the Medieval Burmese (Bama) capital of Bagan, Myanmar (11th to 14th century CE). As part of this long-term research program investigations have been initiated on the Tuyin-Thetso mountain range, located 11.25 km southeast of Bagan's walled and moated epicenter. This upland area figures prominently in the chronicles of early Bagan, and numerous 13th century religious monuments were erected there. Recent explorations on Tuyin-Thetso have drawn attention to an additional feature of historical significance, a rock-cut tank located along the eastern edge of the Thetso-Taung ridge. Referred to by local villagers as Nat Yekan (Spirit Lake), this reservoir appears to have been integral not only to the initial collection and subsequent redistribution of water via a series of interconnected canals and reservoirs spread across the Bagan plain, but also, through its associated iconographic imagery, it may have been intended to purify this water, symbolically enhancing its fertility. This presentation will provide a preliminary assessment of Nat Yekan's potential economic, political, religious, and ideological significance during Bagan's classical era.

Ibarra, Eugenia (Universidad de Costa Rica)

[260] *What Archaeologists Can't See: Contrasting Ethnohistorical and Archaeological Data in Talamanca, Costa Rica in the 16th Century*
Archaeologist Francisco Corrales and myself recently undertook the study of the exploitation of natural resources and their exchange in the areas close to Juan Vázquez de Coronado's route in 1564, traced from the Pacific coast to the Caribbean in Southeastern and Southwestern Costa Rica. This presentation aims to underline how resources of the different altitudes on both slopes formed an important part of the various activities carried out by the inhabitants during the 16th. century and immediately before. I will detail the paraphernalia used by usékares and sukias as it becomes important to understand the nature, presence and movement of distinct objects. I will also discuss how, on the area, ethnohistorical, ethnographical, linguistic and mythological data are able to depict clues to the presence or absence of material culture. The Museo Nacional de Costa Rica holds materials coming from that precise area, with no context. A sharper look at written sources can help reconstruct the sociocultural dynamics which can aid archaeologists to interpret and orient their specific work objectives.

Ibarra, Julio (INAH OAXACA)

[158] *Trabajos de Conservación Arquitectónica en el Sitio Arqueológico de San Pedro Nexicho, Colaboración INAH-FAHHO-Comunidad*
La conservación del patrimonio arqueológico en la región de la Sierra Norte del estado de Oaxaca, representa un gran reto debido entre otros aspectos a su entorno geográfico, a cuestiones del ámbito social que se relacionan con el arraigo a sus costumbres y tradiciones; y más aún, a la falta total de antecedentes sobre trabajos previos de conservación sobre el patrimonio cultural local.
En esta ponencia se presentarán los trabajos de intervención para la conservación y restauración de los vestigios arqueológicos efectuados durante el desarrollo del proyecto de intervención en el Sitio Arqueológico San Pedro Nexicho, avalado por el INAH y con fondos de la Fundación Alfredo Harp Helú de Oaxaca, han dado como resultado primeramente frenar el proceso de deterioro al cual fueron sometidos a partir su localización, saqueo y desatención; logrando mediante la aplicación de los criterios de restauración, sentar las bases para garantizar su conservación, partiendo de la concientización de la comunidad a raíz de su participación en dicho trabajos.

Ibarra, Thania (Proyecto Arqueológico Tepeticpac—Centro INAH Tlaxcala) and Aurelio López Corral (Instituto Nacional de Antropología e Historia)

[31] *A Technological Approach of Textile Production in Late Postclassic Tlaxcallan*
Textile production had a pivotal role among Late Postclassic societies including ancient Tlaxcallan, a prominent altepetl of the Puebla-Tlaxcala region. Several scholars have studied prehispanic cloth and garments production based on 16th century historical sources, but using little archaeological evidence. In particular, poor attention has been paid on the technology of textile production based on archaeological artifacts, especially in relation to spinning techniques and the different fibers exploited. In order to assess the technological characteristics of thread production in Tlaxcallan, here we analyze a sample of 364 archaeological spindle whorls recovered at the site of Tepeticpac, one of the main members of this political entity. By evaluating their mechanical performance, in association to different fiber processing techniques and thread qualities, we establish the existence of two large groups of archaeological whorls that are correlated with two spinning techniques. In addition, experimental analysis using replicas shows that it is possible to process a variety of short or long staple fibers with each spinning technique, and that artisans can choose the type of spindle whorl to use according to personal experience and skills.

[18] *Intraregional Interaction in the Zapotitan Valley, El Salvador: The San Andres Regional Center and Joya de Ceren Village*
This paper provides new insights to better understand the intraregional interaction, especially San Andres and Joya de Ceren in the Zapotitan Valley of El Salvador. Joya de Ceren is a village of commoners that was buried by the Loma Caldera eruption, which occurred around AD 650; it is one of the most studied ancient villages in Mesoamerica. Moreover, the previous study indicate that this village might have been closely connected to San Andres, which is the religious, political, and economic center in the region. However, due to limited research, the extent of control of the elite of San Andres over the commoners of Joya de Ceren remains unclear. Therefore, the author recently conducted an archaeological investigation at San Andres. The results revealed that in San Andreas, the major occupation and construction of public architecture developed after the Loma Caldera eruption. In other words, San Andres might not have been a regional center at the time of Joya de Ceren. In addition, based on these findings, the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

interpretation of the Joya de Ceren commoners and the nature of interaction between regional centers of the elite and villages of commoners can be reconsidered.

Iglesias, Christina (California State University, Los Angeles), Samantha Lorenz (Contested Caves Archaeological Project) and Toni Gonzalez (University of California, Santa Barbara)

[157] *Redefining the Relationship between the Surface and the Subterranean at Mul Ch'en Witz, La Milpa, Belize*

One of the many unsettled issues in chultun research is the relationship of chultunes to surface architecture. At Mul Ch'en Witz, located within the large Maya site of La Milpa in northwestern Belize, the chultunes are covered by low, rectangular rubble core platforms so that each is an architectural complex with both a surface and a subterranean component. This degree of formalization of the surface space had not been previously reported until recently at RB-25-A5, a collapsed chultun also located at La Milpa. Data on the surface construction of chultunes at Mul Ch'en Witz along with speculation on its significance will be presented here.

Iizuka, Fumie (University of California, Merced), Masami Izuho (Tokyo Metropolitan University) and Mark Aldenderfer (University of California, Merced)

[155] *Evaluating the Advent of Neolithic in Southern Kyushu, Japan, through Systematic Ceramic, Lithic, and Paleoenvironmental Studies*

Archaeologists suggest that during the transitions between the Pleistocene and the Holocene, drastic changes occurred in the lifeways of humanity. They are termed the "Neolithization processes." Changes include the advent of food production and sedentism, and the adoption of pottery and ground stones. However, case studies around the world suggest that the timings, order, and nature of the occurrence vary. More case studies are required to better understand the "Neolithization." In this study, we focus on the transitions from the Upper Paleolithic to Initial Jomon periods of southern Kyushu, Japan. The earliest signatures of sedentism are found there. Pottery was adopted at least by 14,000/13,500 years ago by hunter-gatherers. Our previous study suggested that the advent of ceramics is associated with sea level changes but the change in climate and biomes may correspond with the increase in the occupational intensity, the proportion of decorative vessels, and lithic type variability. In this study, we conducted (1) a systematic literature-based investigation of ceramics, stone tools, features, and paleoenvironment, (2) a visual analysis of pottery and stone tools, and (3) map-based research of landscapes. Our results add new understanding to our previous results on the timings of technological, behavioral, and paleoenvironmental changes.

Ikehara Tsukayama, Hugo (Pontificia Universidad Católica de Chile)

[75] *Scars of Warfare: Early Fortifications and Politics in Coastal Ancash (Peru)*

Between 500 BC and AD 500 communities of the coastal valleys of Ancash (Peru) lived in a period of increased conflict and violence. People moved to defensive locations and invested in the construction of defensive infrastructure such as: walls, moats and fortifications. These features are still visible today as scars in the landscape. Two moments have been defined in this period and are related to the Salinar and Gallinazo archaeological cultures, each characterized by different settlement patterns and defensive strategies. These differences suggest the nature of warfare changed through time. This paper presents a study of how defensive infrastructure in the Nepeña middle valley is related to changes in local and regional politics, more specifically to the transition from a balkanized landscape to the possible emergence of a unified chiefdom.

[20] *Cranial Vault Modification in the Mariana Islands*

Cultural flattening of the posterior skull, rare in the Mariana Islands, was recently observed in multiple human skeletons from a Latte Period site in Guam. Prior to this study, only one case of possible artificial cranial modification was reported for this region. The cranium of a young adult female from Songsong Village, Rota, was described as having "asymmetrical deformation in the occipital region consistent with artificial shaping practices." In a review of the ethnohistoric literature, journal articles, available historic preservation compliance reports, and unpublished photographs, we evaluate the extent of cranial modification in the Mariana Islands. Using these resources, we identified crania from five burial assemblages in Guam, Tinian, and Rota that appear to have been culturally modified. Since these Latte Period sites each contain an early Spanish Historical Period component, it is possible a cultural practice that unintentionally (e.g., cradle boarding) or intentionally caused cranial modification was introduced shortly after European contact in 1521. Alternatively, this may have been a long-standing Chamorro practice that has been largely overlooked in pre-Contact burial assemblages. Results of this evaluation suggest modified crania are being under-reported in the region.

[142] *Public Spaces and Polity Making in Maya Hinterland Communities: A Case Study from San Lorenzo, Belize*

Public structures in the Maya region materialize ideologies and define centers of power as they create politically charged sacred landscapes. These locations are nexus points for community and polity making processes, embedding social hierarchies, ideologies, and social memories into the physical landscape. However, archaeologists have historically focused attention on monumental public spaces within large civic-ceremonial centers, and relatively little attention has been given to public spaces within rural communities. Yet it is at these public structures and spaces that entanglements of both top-down and bottom-up processes are visible to archaeologists. To explore the ways in which hinterland or 'rural' communities may integrate and articulate with larger 'heartland' seats of power, this paper will examine one such public group at the hinterland site of San Lorenzo, Belize. Data demonstrates that this group was used and modified by the local community from the Preclassic to the Terminal Classic periods. Its proximity to the large center of Xunantunich and the continual use of this space over centuries suggests that this group played an enduring role in the socio-political integration of the San Lorenzo community and Xunantunich polity.

[294] *"Left for the Tide to Take Back": Specialized Taphonomic Mechanisms at Play in a Coastal Maine Seal Hunting Camp*

Archaeological investigations at Holmes Point West (Maine site 62-8) on the eastern Maine coast have yielded potential indicators of cultural treatment of seal remains that vary between two primary species: harbor seal (*Phoca vitulina*) and gray seal (*Halichoerus grypus*). Analyses of these patterns required development of element-specific speciation factors for best represented elements for each species, the temporal bone of the skull, including the auditory bulla and mastoid process. Holmes Point West is situated in the midst of a high density of petroglyph sites on Machias Bay, and in the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

context of abundant Algonquin oral traditions emphasizing cultural practices that reflect respect for the spirit of hunted animals. This presentation hypothesizes cultural practices associated with bone disposal patterns within the assemblage, and trajectories for ongoing research at Machias Bay.

Ingram, Scott (Colorado College)

[247] *Engaging the Past for a Warming World*

Increasing the public benefits of archaeology involves more than increasing our assertions of relevance. Relevance is a vague term that is easy to assert because it is difficult to disprove. Likewise, archaeology is not a predictive science and promoting “lessons from the past” creates unrealistic expectations of archaeologists and our work. If we are to connect the past to efforts to address climate change, we need to provide specific, archaeologically-informed examples that demonstrate how the past can inform human actions to address climate change. This presentation will offer specific examples of how a long-term perspective and some knowledge of the past can (should?) influence public actions and policy decision-making. It is hoped that these examples will be shared and stimulate similar efforts that demonstrate, but do not assert, the need to engage the past for a warming world.

Inomata, Takeshi (University of Arizona)

[147] *Termination Deposits at Aguateca and Ceibal, Guatemala*

Excavations at Aguateca and Ceibal revealed a series of dense deposits associated with the ritual destruction of buildings. At Aguateca, such deposits were found in and around Structures M7–22 and M7–32 of the Palace Group, probable royal administrative-residential buildings. Excavators also unearthed similar deposits around Structures L8–6 and L8–7, temple pyramids in the Main Plaza. These deposits date to c. AD 810 when enemies attacked Aguateca. At Ceibal, dense deposits of broken objects were found in and around structures surrounding the West Plaza of Group D, the probable royal palace complex of the illegitimate ruler, Ajaw Bot. This complex appears to have been destroyed at the end of Ajaw Bot’s reign around AD 800 or 810. Another set of deposits were revealed in and around Structure A-14 and A-16 of the East Court, Group A, the likely palace complex of Wat’ul K’at’el and his successors during the Terminal Classic period. These deposits were most likely made around AD 900 when the Ceibal dynasty collapsed. These examples show certain variability in types and contents of deposits, but they are all tied to the ritual destruction of royal buildings at the time of dynastic disruption or collapse.

[171] *Acts of God? Causation and Agency in Disease History*

Epidemics are often understood both by historians and by ancient people as “acts of God” which structure human lives but originate outside systemic causation, and are simply caused by the advent of pathogens. But no simple model of unidirectional causation, whether by natural agents or humans, really does justice to the situation. Disease responds to social and biological environments (for instance, settlement distributions affecting contagion, and poverty and malnutrition compromising the immune system), and it has complex effects on society. The result is a model of causation in which agency resides in systemic relations rather than single entities. This argument is illustrated by considering the Black Death in Britain (1348–50) and other diseases affecting medieval English people.

Ionic, Daniel (McMaster University)

[95] *The Recipes of Disaster in Northern Iroquoia: Integrating Digital Image Analysis into Petrographic Practice*

European contact with Northern Iroquoian communities brought about a series of direct and indirect consequences. These involved European-disease epidemics and a series of migrations that moved people across the landscape as refugees, captives, or conquerors. Ceramic petrography offers a way for archaeologists to understand the impacts such demographic upheavals can have on technological systems. Iroquoian potters often use a recurrent set of rock and sand types that homogenize the paste-type assemblage, yet textural data (inclusion sizes, density, sorting, roundness, and sphericity) from thin sections can be used to explore micro-style changes in pottery production. However, constraints on time and levels of experience are often at odds with point counting procedures and recommended sample sizes for statistically significant studies. In this study, I couple qualitative and semi-quantitative assessments of petrographic samples with a digital textural analysis using the free open accessed program ImageJ (v. 1.51k) and Adobe Photoshop CC 2017. With this collection of techniques, I analyzed samples from two villages in the Neutral Iroquoian Confederacy that represent before and after chronologies for a series of demographic shifts to consider how these experiences altered paste preparation practices.

[85] *Lithic Raw Material Procurement and Mobility in a Geological Diversed Environmental Setting in Prehistoric Eastern Sicily*

The geological constitution of Sicily is enough complex as the characteristics of the geological units are consequences of the tectonic compression that happened between the beginning of Miocene and the beginning of the Pliocene. Three structural units are basically distinguished:

1. To the north, in the western side (towards Palermo) there is prevalence of carbonatic reliefs while in the oriental side (Nebrodi Mounts and Peloritani Mounts) there are metamorphic and terrigenous deposits
2. the central part and western center, is mainly occupied from a graben terrigenous sediment
3. the Hyblean plateau, constituted by carbonate cliffs. Three distinguishable ecological and orographic units characterize the south eastern Sicily: The Aetna volcano, the plain of Catania and the Hyblean Mounts. During Prehistoric time, thanks to this geological diversity, the sourcing of efficient lithic raw material was flourishing. Volcanic glass is virtually absent.

This paper focus on the peculiar contexts of early Neolithic Sicilian sites from eastern Sicily to discuss their strategy for lithic raw material procurement, local and exotic, and their potential involvement into the development of new mobility systems.

Iovita, Radu (New York University)

[329] *Behavioral Modernity (or Lack Thereof) and Its Reflection in Lithic Assemblages*

One of the most important methodological issues facing modern paleoanthropology is the so far failed matching of archaeological material with specific hominins, at least at the metapopulation level. Due largely to the plethora of scenarios produced by genetic and genomic data in the last few years, the demand for archaeological confirmation or refutation of diverse dispersal scenarios has increased. Yet our understanding of lithic assemblages is not sufficiently nuanced to answer these questions. This is compounded by research bias in some of the places of likely contact between multiple species/metapopulations, such as Eastern Europe, Central Asia, and Southeast Asia. We review the history of key definitional concepts, such as Levallois and prepared-core technology, blades and bladelets, as well as retouch intensity and tool diversity in the context of shifting fossil identities of their makers. We ponder the effect of ecology, taphonomy, and function in determining our studiable units, and propose that the answer to separating populations probably depends on multiple lines of evidence that preserve different life ways rather than individual strands of material culture. We abstract from examples of contact situations from the historical record (albeit between members of our own species) and discuss their potential outcomes.

[213] *Climate Change and Polyculture Agroforestry Systems: Examples from Amazonian Dark Earths*

In this presentation, we discuss pre-Columbian Amazonian Dark Earth (ADE) polyculture agroforestry systems and its implications for management and conservation efforts on Amazonian sustainable futures under current threat from climate change and development. We present and compare new multi-proxy paleoclimate, palaeoecological and archaeobotanical data from two mid to late Holocene records of land use history of ADE in Santarem (Lower Amazon) and the Itenez Forest Reserve (SW Amazonia). Our data complement the previous understanding pre-Columbian land use of Amazonian Dark Earths based on soil science and geoarchaeology by offering new palaeoecological insights into ADE in relation to resilience to climate change, crop and fruit-tree cultivation, as well as fire and forest management. Our results provide a long-term example of sustainable anthropogenic landscapes in the Amazon which can inform sustainability and climate change in tropical social systems.

[260] *The Greater Chiriquí Fringes: A Perspective from the Coiba National Park Islands on the Pacific Coast of Panama*

The islands of the Coiba National Park (CNP) are located on the continental platform of Panama and the southeastern fringes of the Greater Chiriquí cultural region. During the period of the earliest human migrations to the isthmus (ca. 13,000—10,000 a.P.) these islands were connected to the mainland, although the current state of research cannot provide evidence of being inhabited earlier than ca. 1800 B.P. Multidisciplinary research aimed to study the long-term impacts of human on the insular forest of Coiba and its neighboring islands revealed, however, that the groups that colonized them had simultaneous affiliations with their closest neighbors from the Greater Chiriquí and Greater Coclé coastal zones. This presentation will focus on the results of survey and *décapage* excavation data from three of the CNP islands revealing evidence of domestic and ritual deposits from ca. A.P. 1500—950. I will address the issue of island colonization on a critical period when the local societies began to define themselves politically and economically, as well as the fluctuations in cultural affiliations as depicted on the material culture.

Isbell, William (SUNY—Binghamton)

[300] *Huari Urban Prehistory: An Introduction to the Excavations of 2017*

From June through mid-August archaeological excavations were conducted at the Patipampa section of Huari, Ayacucho, Peru, where prehistoric constructions are not preserved on the surface. The goal of this first season of excavation was to detect and expose outlines of the built environment in approximately a hectare of space believed to contain primarily residential remains. As spatial organization becomes clear, individual architectural spaces were excavated to learn about everyday life in the capital city of Huari. This presentation provides an overview of project and its first-year results, while also contextualizing most of the other papers constituting the symposium.

[251] *A Brief History of Archaeology Studies in Maryland with Biographical Sketches of Notable Maryland Archaeologists and Avocational Archaeologists, 1870 to 2018*

I began the "Maryland Archaeology: Past Portrait Project" because I came across many undocumented terrestrial, underwater, and avocational archaeologists in Maryland, and realized they provided a large range of information on Maryland's forgotten and unacknowledged archaeological activities and accomplishments. My goals for this paper were to document, to the extent possible, many of the forgotten contributors of the late 19th, 20th, and early 21st century archaeological surveys and investigations, personal artifact collections, memories, and records (1) before they are lost to memory, (2) acknowledging their contributions to the understanding of Maryland Archaeology, and (3) for compiling an early 21st century comprehensive database for future syntheses on Maryland Archaeology. Compiling the early and current archaeological surveys and investigations, and documented artifact collections, personal memories and their written records is an important first step before their memories, their records, and their artifacts disappear altogether. A cross section of biographical sketches will illustrate what surprises I found while compiling these profiles.

[104] *New Mexican Cuisine as Ethnogenesis*

Food is a major vehicle through which cultural identity is both formed and expressed. While foodstuffs are often consumed based on cultural practices, they are also utilized based on availability. The colonial situation in New Mexico provided a particular environment in which a new cuisine was developed, and persists to this day. The Spanish colonists brought with them both food traditions from Europe, and from Mexico, where they had been inhabitants for generations. In New Mexico, the food traditions that the colonists brought with them blended with native food traditions, thus producing the "New Mexican cuisine." By analyzing the macrobotanical remains from LA 20,000, I will attempt to understand how the identity of the site's inhabitants developed through food. The first step will be to attempt to reconstruct the cuisine at LA 20,000 by using a combination of macrobotanical archaeological data and historical data. Macrobotanical data indicates a mix of indigenous foods and foods introduced by Spanish colonizers at the site. After gaining an understanding of the diet at LA 20,000, it will be possible to observe changes in frequencies of crops over time, supplementing with data from later New Mexican sites.

[226] *Roads, Canals, and Agricultural Fields: Widespread Landscape Development across Chapin Mesa, Mesa Verde National Park*
Constructed roads affiliated with Ancestral Pueblo great house architecture are well documented in the cultural landscape of Chaco Canyon and elsewhere across the Colorado Plateau, but the potential for such features has received little attention on the Mesa Verde cuesta. This project examines the archaeological background and provides new insight into one such feature in Mesa Verde National Park. This feature, variously interpreted as a trail, road, and a canal, has been enshrouded in controversy since first recognized by Dr. J.W. Fewkes during his investigations in the Far View area during the early decades of the 20th century. Project investigations are expected to document widespread landscape development across northern Chapin Mesa.

[120] *Confluences: Fluted Points in the Ice-Free Corridor*
Widely assumed to be younger than Clovis forms, Corridor fluted points have been dated just once, at Tse'K'wa (Charlie Lake Cave). Given clear evidence of biotic habitability along the entire Corridor before 13,000 years ago, along with early hunting in its southern funnel, moderately dense fluted point clusters likely reflect both Clovis contemporaneous and later fluted point instances. These points were overwhelmingly fashioned on local toolstones, featuring a bimodal length distribution of some larger, relatively unaltered fluted points, plus many reworked, smaller fluted points at the end of their use life. Corridor fluted points are generally found in tertiary landscape settings rather than major kills or campsites. Consistently wide point bases (on average, greater than 26 mm) imply that shaft morphology remained little changed in the hunting of game animals including horses, bison, camels, sheep and caribou. Fluted point makers traversing the Corridor eventually met populations bearing eastern Beringian traditions; determining the degree to which diffusion or demic expansion mediated north-south interactions is a research priority. A template featuring deeper U- and V-shaped bases with multiple flutes was at play, creating geographically intermediate forms decidedly similar to Younger Dryas-aged Alaskan fluted points.

[302] *An Osteobiography of Skeletal Remains from Holtun, Guatemala*
Excavations at the site of Holtun, Guatemala during the 2014–2017 field seasons yielded eighteen human burials from various temporal periods and site locations. Holtun was inhabited by the ancient Maya from the Middle Preclassic (1000–300 BCE) to the Terminal Classic Period (600–900 CE). Recent archaeological investigations have identified the Preclassic period at Holtun as a time characterized by increasing social inequality, but few burials have been recovered to infer the impact of social change on individual health. This poster describes skeletal observations and analysis of the burials excavated from Holtun. Individual osteobiographies are created for each due to variation in preservation, mortuary features, and chronology. Specifically, this research will examine patterns in age-at-death, sex, presence of pathology, and cultural modification, in conjunction with mortuary data to begin the exploration of social identity as reflected in burial remains. Unique features, including dental modification, suggest some individuals exhibited elevated social status exemplified with burial in the site core. The results of this study contribute to research regarding the nuances of increasing social complexity at Holtun, and broadly contribute to our knowledge of ancient Maya life and the intersection of skeletal health and inferred social status.

[88] *A Comparison of Mock Excavations and Active Case Excavations*
Performing mock excavations of human skeletal material is a common practice throughout undergraduate and graduate studies in Forensic and Bioarchaeological programs. These class sessions include instruction on correct excavation methods, mapping techniques, documentation methods, and chain of custody. Inevitably however, there are differences between mock excavations within a class setting and active homicide excavations where no professor is present and the real-life ramifications of the students' actions are dramatic. Instead of practicing for a grade, the student must aid in the deliverance of justice for the victim and work well with law enforcement while professionally executing what they've practiced in school. The goal of this presentation is to discuss real-life experiences of an active homicide excavation in comparison to how mock excavations are traditionally taught. We hope to offer insight from a student perspective to help current and future educators develop effective methods of teaching mock excavations and to prepare students for what a real excavation may entail.

[40] *Contrasting Cartographies: Mapping a Maya Site Using Multiple Perspectives*

Archaeologists routinely engage with concepts of space and materiality as we inscribe meanings onto the architecture and objects left behind by past peoples. However, in doing so, we bring explicitly modern sensibilities to our interpretations. In this paper, we consider alternative interpretations of space and materiality as described by Classic Maya people (250–900 CE). We ask: In what ways do categorizations and interpretations of space at Maya archaeological sites change when traditional archaeological spatial analyses are augmented by ones based on Classic Maya characterizations? What can be learned from identifying places of convergence and divergence between these two datasets? As part of our excavations of the site of Say Kah, Belize we have developed and used a recording system that allows us to document excavated artifacts and features simultaneously within conventional archaeological frameworks and also using Classic Maya categories. These parallel classifications, when visualized as distributions of artifacts and features within GIS, allow us to compare and contrast two sets of spatial documentation at a detailed and site wide level and explore the cultural meanings in spaces that would not otherwise appear in studies of the site created using solely modern, Western spatial and artifactual classifications.

Jacobson, Jodi (TRC Environmental)

[90] *Broken Bones: Taphonomy vs Cultural Modification in North and Central Texas*

Until recently, highly fragmented bone assemblages in Texas were almost all attributed to poor preservation. A review of assemblages, however, indicates that while there are a high percentage of heavily fragmented medium-sized and larger mammal bone at many of these sites, bones associated with small mammals, reptiles, avian, and fish have only minimal fragmentation. A review of bone from a variety of sites with deep temporal and well-stratified context and of varying degree of preservation and fragmentation from Central and North Texas including 41DL436 (Fish Creek Slough Site), 41TR203 (Mercado Site), 41HM51, and 41WM1126 (Siren Site) are examined and contrasted. Differences in taphonomic versus human imposed bone breakage for each site are presented. Patterns in temporal variations and overall frequencies of fragmentation combined with evidence for intentional fracturing are identified to examine trends and shifts in, and methods for, marrow and bone grease extraction in Central and North Texas through time. These trends are placed within a greater context of environmental changes and reviewed as potential indicators of dietary stress and shifts in subsistence resource availability.

[330] *The Geoarchaeology of Vista Alegre*

The maritime Maya site of Vista Alegre, located in the northeastern part of the Yucatan Peninsula is being investigated with the aim to achieve a comprehensive understanding of the daily life of the past inhabitants, and their interaction with their surrounding environment. Results from a sediment core campaign resolved the character, environmental associations, and ages of underlying sediments. To achieve a continuous lateral understanding of the underlying sediments, a seismic survey was conducted. The survey area covered the immediate flooded area of Vista Alegre, focusing on zones that have morphologically changed throughout time, flooded during sea level rise, and which showed promise as likely locations for use during maritime activity by the past inhabitants. The seismic survey results provided evidence for sea-level rise, and revealed a ridge-basin structure that was congruous with natural trends observed terrestrially. This uniqueness could be attributed to significant differences in the submerged landscape, and possibly the presence of anthropologically-altered offshore features. The seismic interpreted data is useful both for a site scale spatial understanding of the flooded landscape history, as for aiming for potential location of marine archaeological excavations.

Jaillet-Wentling, Angela (PENNDOT) and Samantha Taylor (Indiana University of Pennsylvania)

[53] *Building a Public Archaeology Effort Finding the Best Foundation Somewhere between Bedrock and Shifting Sands: Public Archaeology Efforts at Pandenarium (36ME253)*

Small-scale and volunteer-driven public archaeology efforts undertaken at the site of Pandenarium (36ME253) aim to bring the results and practice of archaeology to many publics with recent outreach efforts including partnerships between state agency personnel and university archaeology programs, fieldwork opportunities for volunteers, interviews with local media, and presentations at local, regional, and national conferences. With changing methods and times, our definition of hybrid professionals (Jeppson, 2005) can be characterized as in flux when they move beyond the formal definitions of applied, theoretical, academic, or even compliance-driven public archaeological efforts to informal volunteer-based programs. While not necessarily a novel approach, an effective partnering of research and socio-political interests paired with the experience and willingness of off-duty professionals can provide a foundation for future research and volunteer organizations. Not everybody needs to build on the bedrock of fully-funded formal programs, but shifting sands of one or two individuals will not do either. The flexibility in building informal partnerships out of professional and formal relationships allows us to move beyond concerns with who is telling the story to telling the story for those who would listen.

Jamaldin, Sophia (University of Nevada, Reno)

[92] *Paleoindian Cave and Rockshelter Use in the Fort Rock Basin, Oregon*

The Fort Rock Basin's (FRB) caves and rock shelters hold an important place in the history of Great Basin archaeology. Excavations at Fort Rock Cave by Luther Cressman in the late 1930's led him to argue for a long-standing presence of humans in the region. The subsequent development of radiocarbon dating confirmed his ideas, providing firm evidence for a considerable human population in the FRB during the Terminal Pleistocene/Early Holocene (TP/EH). Although most caves and rock shelters probably served as logistical and/or cache locations throughout prehistory, the substantial TP/EH archaeological deposits recovered from Fort Rock Cave, Cougar Mountain Cave, and the Connley Caves suggest residential occupations. Using a central place foraging model, I test the hypothesis that those caves served as longer-term residential camps from which peoples came and went (i.e., central places). I present an analysis of source provenance data generated on extant collections of obsidian projectile points, evaluating patterns of Paleoindian toolstone use as a baseline for interpreting the occupation spans at the FRB caves and settlement-subsistence strategies of early groups in the region.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Jamison, Thomas and David Mixter (Binghamton University)**[129]** *Public Architecture and Space at Actuncan*

Monumental architecture and public spaces provide primary contexts for community ritual and social action. The process of construction of public architecture involves community cooperation and collective action, with the latter contributing to significant changes in the form and use of structures through time. The public architecture of Actuncan developed from the Preclassic period to constitute a nearly complete set of architectural forms devoted to ritual, administrative and community functions. The excavations at Actuncan over nine seasons have documented much of the development of the center and history of individual structures. This paper traces the development of the public architecture, public spaces and the changes to individual structures and associated deposits that inform an interpretation of the social context in which they were constructed, utilized, modified and abandoned.

Janzen, Anneke (Max Planck Institute for the Science of Human History), Mary Prendergast (St. Louis University—Madrid) and Katherine Grillo (University of Wisconsin—La Crosse)**[310]** *Early Pastoralists in Tanzania: Mobility and the Seasonal Round*

First developing around 8,000 years ago, pastoralism in Africa has continued as a flexible and dynamic mode of subsistence. One key feature of this dynamism is mobility, which is crucial for many East African pastoralists today to access seasonally available pasture and water. In areas of unpredictable rainfall, mobile pastoralism permits more people to live in dry lands than do other subsistence strategies. How the earliest herders in Tanzania used the landscape is still relatively unknown. Recent excavations at Luxmanda provide detailed information about early pastoral lifeways in Tanzania. Situated at the southern edge of Tanzania's Mbulu Plateau, Luxmanda is the earliest and most southern known Pastoral Neolithic site, thus providing an intriguing example of pastoral mobility strategies as herding initially took hold in Tanzania. We present the first isotopic analyses of ancient livestock in Tanzania. Carbon and oxygen stable isotope data from sequentially sampled cattle and caprine teeth provide a record of seasonal herding practices. Strontium isotopes clarify movements across distinct geologies, providing a nuanced picture of both herding over the seasonal round and possible livestock exchange among pastoral groups. Finally, these analyses throw more light on the nature of the spread of pastoralism in Africa.

Much of the archaeological research done in the interior deserts of Australia has focused on rockshelter sites, primarily because of intact stratigraphy and better preservation than in open air contexts. However, ethnographic studies of local Martu populations have demonstrated that people rarely lived in rockshelters or caves, particularly during the wet season when populations focused around reliable soaks and clay pans. Therefore, it is necessary to study the distribution of archaeological sites and cultural materials in open air contexts to fully understand settlement patterns. During the 2017 field season, we conducted a systematic survey of the Wuukurta Clay Pan region in Karlamilyi National Park, less than a day's walk west of the present-day Parnngurr aboriginal community. The cultural landscape surrounding the main soak contains extensive groundstone and lithics, with the highest densities of cultural materials at the edge of the soak and two clay pans. Seasonally available water and subsistence resources attracted people to the region and provided the potential to support wet season population aggregation. This poster shows the distribution of cultural materials in Wuukurta and demonstrates the archaeological research potential of open air contexts in understudied desert environments.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Jean, Joseph**[123]** *Long-Term Survival of Indigenous Cultures in Haiti*

The Espanola island was disrupted by the Spanish colonial power by massively forcing Indigenous people to work in the gold mines and to cultivate fields for producing foods for the Spaniards following the Encomienda system. The rise of European imperialism conducted to share the New World where the island of Espanola was officially occupied by the Spanish and French. Massive French investments into an agricultural industry lead to a large number of enslaved Africans being transported into the colony. Long before the division of the island into two possessions, Haiti experienced significant installations of French Buccaneers operating mainly along the North coast and Tortuga Island. It is from these interactions that developed the first perceptions of the French encounter in the cultural landscape. Behind the traditional discourse, there were exclusive social categories for African, Mulatos, and White people of the colony, by using primary archives as sources, as well as historical and ethnographic perspectives, this presentation proposes to examine contributions of free and enslaved Indigenous people in the colony of Saint-Domingue and their legacies of their cultural survival in the Haitian present-day society. In addition, it will address questions of future directions for cultural landscape studies related to *longue-durée* transformations

Jefferies, Richard and Christopher Moore (University of Indianapolis)**[241]** *Baubles, Bangles and Beads: The Role of Personal Adornments in a 17th Century Spanish Mission Period Community*

More than a decade of archaeological investigations at Mission San Joseph de Sapala and its associated Guale village of Sapala on Sapelo Island, Georgia have provided significant new insights into the nature of Spanish-Guale interaction and negotiation. Some of these cultural transactions are reflected by items of clothing or personal adornment that were worn by the Spanish and/or Native Americans who lived in that 17th century Spanish Mission community. This poster explores the nature of personal items, such as buttons, earrings and beads, worn by the mission community's Guale and Spanish residents to express their evolving personal identities and cultural affiliations in a world characterized by social, economic, and political upheavals brought on by massive population loss, demographic displacement, and the destruction of traditional Guale society.

Jeger, Rujana (None) and Darcy Morey (Radford University)**[212]** *When Dogs and People Were Buried Together*

Throughout prehistory, dogs and humans have sometimes been interred together in the same grave, in different locations in the world. This practice raises the question of why this practice was so prevalent. Circumstances leading to this practice were variable, but its consistency suggests an underlying factor in common. Using one of the earliest known cases as a point of departure, Bonn-Oberkassel from Germany, we suggest that this underlying factor in common is that dogs and people were regarded similarly. Further, as part of developing that framework, we suggest that in certain cases, simultaneous human-dog interments may not so much have reflected one or more dogs being buried with people, but rather one or more people being buried with dogs.

Jenkins, Emma (Bournemouth University), Samantha Allcock (Plymouth University), Sarah Elliott (University of Exeter), Carol Palmer (Council for British Research in the Levant) and John Grattan (Aberystwyth University)**[4]** *Phytoliths, Geochemistry and Ethnography: A Multi-method Approach for Interpreting the Neolithic Sites of WF16 and 'Ain Ghazal*

Understanding Neolithic sites in southwest Asia is often difficult because of the lack of preservation of organic remains and the effects of various taphonomic processes that alter the original record. It is, therefore, critical that we maximise the information that can be acquired from these sites. Here, we use an ethnographic approach to test the potential of using plant phytoliths and geochemistry to aid our interpretation of southwest Asian Neolithic sites. We sampled two Neolithic sites-WF16 and Ain Ghazal-and one ethnographic site-Ai Ma'tan-a recently abandoned stone and mud constructed village. Here sampling could be supplemented by information gained from informal interviews with former residents, which furthered our understanding of how the phytolith and elemental concentrations formed. We sampled distinct context categories such as 'middens', 'storage features', and 'roofs and roofing material'. Our results found that certain categories from all three sites showed similar patterns in their phytolith and elemental signatures such as 'storage features', 'floors and surfaces' and 'fire installations' whereas others were quite distinct for example 'pisé walls'. These results demonstrate that phytolith and geochemical analysis can greatly improve our understanding of southwest Asian Neolithic sites.

Jenks, Kelly (New Mexico State University)**[39]** *On the Road Again: Archaeology on El Camino Real*

In 2017, graduate students enrolled in a cultural resource management class conducted a week-long documentation and surface collection project at Paraje San Diego, a popular historic campsite on El Camino Real de Tierra Adentro National Historic Trail. The Camino Real once connected the Spanish colony of New Mexico, founded in 1598, to the markets and governing authorities in central Mexico. After Mexico won independence from Spain it served as a commercial corridor between Mexico and the United States. Following the Mexican-American War, it hosted American soldiers as they battled Apache raiders, and later each other, in the Civil War. In all of these periods, and in the decades that followed, travelers stopped at Paraje San Diego to rest and fill up on water. Preliminary analysis of the types and locations of historical-period artifacts recovered from the site provides some insight into the dates and nature of these different encampments.

Jennings, Justin (Royal Ontario Museum), Patricia Knobloch (Institute of Andean Studies) and Elizabeth Gibbon (University of Toronto)**[211]** *Who Founded Quilcapampa? Wari Agents, Social Network Analysis, and the Unfurling of a Middle Horizon State*

At the beginning of the ninth century AD, a Wari-affiliated settlement was founded in the Sihuas Valley of southern Peru. Celebrants ritually smashed face-necked jars when they abandoned the site less than a century later. These vessels likely represent elites or ethnic groups in the Wari sphere—agents whose associations in conflict or cooperation can be used to tell a more dynamic story of the founding of Quilcapampa during this turbulent era of Wari state expansion. This paper uses social network analysis (SNA) to explore the relationship between Middle Horizon agents throughout Peru based on site provenance and artifact co-occurrence. We suggest that SNA hints at a series of changing relationships between agents that speaks both to the complexities of Wari governance and the reasons behind the creation of sites like Quilcapampa.

Jensen, Anne (Bryn Mawr College)**[135]** *Salvaging Heritage and Data from Walakpa: A Case Study of the Walakpa Archaeological Salvage Project (WASP)*

Walakpa is an iconic Arctic site with spectacular preservation. Sadly, the once stable site began eroding rapidly in 2013, with ongoing erosion outpacing attempts to obtain traditional funding for excavation. The loss of cultural heritage led to growing international volunteer efforts, starting in 2015, with support from the landowner (an Alaska Native village corporation) and many individuals. I will discuss both the success and challenges of this type of project. Walakpa is only one of many significant sites threatened by various aspects of climate change. I will discuss the implications for our future ability to contribute to the expansion of scientific knowledge of the past and thereby to sustainable and resilient communities for the future.

[247] *Discussant***Jenz, Trisha (University of Wisconsin Oshkosh), Sarah Ledogar (University of New England) and Jordan Karsten (University of Wisconsin Oshkosh)****[304]** *Dogs of Death: An Evaluation of Canid Remains from a Mortuary Eneolithic Cave Site in Ukraine*

Burials of dog skulls and full dog skeletons have been uncovered at several Eneolithic Tripolye (5100–2900 cal BC) sites suggesting that dogs held a special symbolic role for the Tripolye compared to other domestic fauna. To evaluate human-dog relationships in Tripolye culture and funerary context, we examined dogs from a single mortuary site (Site 17) located in Verbeba Cave (3951–2620 cal BC), Ternopil Oblast, Western Ukraine. Symbolic representations of canids have been observed on some pottery sherds found at the site. The faunal sample (n=7560) from Site 17 contains mainly domestic mammals (n=1389, 18%) and shell (n=577, 8%). Canids (n=122) are rare and comprise around 2% of the faunal sample and only 9% of the domestic fauna. The dog remains are from at least six individuals—three adults and three subadults. Individual teeth were the most common dog elements recovered, including two perforated canines and one perforated lower first molar. These teeth may have been a component of body ornamentation that was incorporated into the Tripolye burial practices or deposits. The other dog elements found in context with other feasting deposits suggest that they were consumed as a part of Tripolye mortuary ritual.

Jeremiah, Kristen (Public Archaeology Laboratory, Inc. (PAL)) and Dianna Doucette (Public Archaeology Laboratory, Inc.)**[294]** *Written in Stone: 10,000 Years of Activity at the Acushnet LNG Site*

The Acushnet LNG Site is a multicomponent Native American campsite located along the Brayton Point peninsula in southeastern Massachusetts. Brayton Point extends into the Mount Hope Bay, at the confluence of two major rivers—the Lee and Taunton rivers—an area with numerous documented Native American campsites and ceremonial sites. Cultural resource management investigations identified an extensive archaeological site, measuring a minimum of 71,000 square meters, that was occupied from the Early Archaic through Middle Woodland Periods based on diagnostic artifacts and radiocarbon dates. Stone piles and configurations were identified within the site by representatives of the Wampanoag Tribe of Gay Head Aquinnah and Mashpee Wampanoag tribes, who defined the stone features as components of a ceremonial stone landscape (CSL). The CSL, combined with the recovered artifact assemblage and archaeological features (fire pits and lithic workshops), indicates the Acushnet LNG Site was a significant Native American meeting place during the pre-contact period, and a valuable resource with the potential to provide new information about Native American settlement patterns along the Mount Hope Bay.

Jerrems, William**[38]** *Pre-Clovis Evidence at Guano Mountain, Nevada*

The Winnemucca Lake basin, one of many branches of Pleistocene Lake Lahontan in northwest Nevada, is again in the headline news for early human occupation of the Great Basin. Possible horse butchering at the end of the Pleistocene, fuel storage, grasshopper caching (14,195 cal. BP) and ancient rock art add to the intrigue of an ever developing mystery behind North America's earliest ancestry. Most familiar are Fishbone and Crypt caves, a part of the Guano Mountain cave complex, where a reevaluation of storage facilities has added a new dimension to the great antiquity of the Lahontan Basin. A synthesis of the evidence found throughout the Winnemucca Lake basin is the purpose of this presentation; an analysis of that evidence is the goal.

Jeske, Robert (University of Wisconsin Milwaukee) and Katherine Sterner (University of Wisconsin-Milwaukee)**[26]** *Early Oneota Longhouses in Southeastern Wisconsin*

Since 1998, archaeologists from UW-Milwaukee have conducted long-term, systematic excavations at the 12th-15th century Crescent Bay Hunt Club site (47JE0904). The Crescent Bay Hunt Club site is unique among early Oneota sites because of the three distinct forms of structures discovered there. This paper focuses on longhouses: portions of at least three longhouses have been recovered from the site. Evidence suggests that these longhouses are at least two hundred years older than previously dated longhouse structures in Wisconsin. Analysis of the pit features, artifacts, and burials associated with these structures provides insights into overall site organization and function. Comparison of these early longhouses with those typical of later sites illustrates the breadth of temporal and geographic variation exhibited at Oneota sites.

Jiang, Leping (Zhejiang Provincial Institute of Archaeology, China)**[284]** *The Sites and Dating of the Shangshan Culture*

The Shangshan Culture is named after the site of Shangshan in Pujiang County, Zhejiang Province, China. Multiple kinds of materials from multiple sites have been dated by several radiocarbon dating labs, indicating that the Shangshan Culture spans 10,000–8,400 BP. It can be divided into three phases: a 10,000–9,500 BP early phase, a 9,300–8,800 BP middle phase, and a 8,600–8,400 BP late phase. There are 18 sites belonging to Shangshan culture that have been uncovered so far. They are distributed in the upper reaches of the Qiantang River, including 4 sites attributed to the early phase, 8 middle-phase sites, and 4 late-phase sites. The other 5 sites have been identified by preliminary survey and their precise attribution remains unclear. The pottery and stone artifacts from these sites show similarities in typology, and rice remains are commonly recovered. As a result, this area has attracted scholarly attention concerning the agricultural origins of rice.

A wealth of mentors, colleagues, and friends influence the evolution of one's approach to archaeological research. This paper reflects on Dennis Stanford's associations with native people beginning with his graduate student days involved in audio recording American Indian Oral Histories for the Doris Duke Foundation, including learning from Santa Ana Pueblo Cacique Porfirio Montoya and his wife Eudora Montoya, assisting with land claims

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

for the return of Sacred Blue Lake to the people of Taos Pueblo, and traveling to Alcatraz during its occupation in 1970 to interview John Trudell and others. Dissertation research in Barrow, Alaska involved generous sharing by Inuit neighbors regarding traditional hunting methods and technology. Later, indigenous archaeologists joined his excavations in Colorado. Stanford served as chairman of Smithsonian's Department of Anthropology during the initial decade of the implementation of the NMAI Act and NAGPRA. He was involved with the Kennewick law suit against the Army Corps of Engineers for NAGPRA violation. Recently, Snoqualmie individuals reached out to share their knowledge and interpretation of the East Wenatchee Clovis Cache and Northern Cheyenne Elder, Ralph Red Fox, initiated a discussion of an ancient Algonquian oral history regarding ancestors who arrived in North America across the Atlantic Ocean.

Johansen, Peter (McGill University)

[230] *Assembling Infrastructure, Detotalizing Communities: Provincial Infrastructure as Situated History and Landscape in British Columbia*
Investigation of the material, spatial and temporal distributedness of large-scale, infrastructure projects holds significant potential to lay bare histories of underlying political rationales and practices that challenge overtly utilitarian narratives of public welfare and economic good. This paper investigates the differential experience and perception of a sample of state-initiated or sanctioned infrastructure projects (e.g., Hydro power lines and substations, pipelines, highways and railroads) on First Nations and non-First Nations communities in southern interior region of British Columbia. I examine 19th through 21st century intersections of settlement and other places with those of state-imposed or sponsored infrastructure as situated histories. The detotalizing effects of large-scale infrastructural projects and their conscious and unconscious rendering of ethno-centric political rationales on First Nation's settlement communities is ongoing in the face of multi-sited resistance, including community-initiated heritage management. Ironically, today, archaeological practices, situated in late 20th Century normative systematics and the constraining objectives of compliance-initiated archaeological field projects (often undertaken in the interests of furthering large-scale infrastructure), unwittingly contribute to both reductive understandings of the region's rich pre-colonial past and an overly biased sample of the archaeological record, one in which in which past cultural landscapes are analytically difficult to conceive.

[38] *A View from the Mountains: A Test of a Predictive Model in the Southern Wind River Range, Wyoming*

This paper details the results of archaeological survey in the Wind River Range, Wyoming between elevations of 9,000 and 11,000 ft. The purpose of this survey was to test a predictive model of a specific site type (sites referred to as villages) created by Stirn (2014) and tested by Stirn in a different region of the same mountain range. Although the methods of creating the predictive model were not altered, the survey methods were significantly altered. Random survey blocks were created within the project area to better sample the landscape for archaeological sites. The use of GPS track logs allowed for quantification of survey intensity and highlighted areas that were not intensely surveyed. The distribution of sites and the quantified surveyed area were compared in order to rule out survey bias as a factor influencing the discovered distribution of sites. The model was not successful in discovering alpine village sites and the distribution of the newly discovered sites can be explained by survey bias. Comparison of lithic assemblages including tools and debitage indicate that the newly discovered sites and previously discovered village locations have differences in tool diversity and debitage:tool ratios, but contain similar attributes of debitage assemblages.

[53] *Resuscitating a Dying City: Instilling Pride Through Public History and Archaeology*

Palatka is dying. This is not a metaphor or an over-dramatic attempt to garner pity: Census reports show that more people are moving out of the city or dying than are moving in or being born. In August of 2017 the Washington Post came down to write an obituary on the quiet river town that was once

known as the Gem of the St. Johns River. Buried in the ground and in dusty books in the historic society's museum are testaments to the city's rich historic and prehistoric past, yet few if any residents know to look...or know there is anything to look for. In a sleepy, disenfranchised river town where public schools barely mention its own history at all, efforts are under way to use history and archaeology as the backdrop to revive the Gem City's sense of pride by renovating the local historic society's museum and hosting a festival dedicated to Bartram's travels. Join us as we take a trip to a city that once bustled with life as one of the largest in Florida, and revive it by invoking a sense of pride using public history and archaeology to power our efforts.

[105] *Global and Regional Frameworks for Comparing Agricultural Intensification and Productivity across Cases*

Understanding variation in the stability and productivity of subsistence strategies is fundamental to explaining patterns of variation in long-term human demography. This poster addresses under what conditions societies intensify food production at both global and regional scales using frameworks ranging from relatively abstract environmental measures to models based on detailed historical and archaeological data relating to agricultural productivity. At a global scale, the combination of effective temperature zones and aquatic resource availability is shown to condition broad patterns in the pace of intensification in a comparison of 14 archaeological sequences. Crop yield models using climatic, historical and archaeological data as inputs provide a framework for comparing changes in carrying capacity over time among archaeological cases from Latium (Italy), Kansai (Japan), and Oaxaca (Mexico). At a regional scale, a model of alternative agricultural strategies in the Maya Lowlands is used to predict which environmental variables explain regional variability in the rate and demographic thresholds of agricultural intensification. Together, we demonstrate the value of using frameworks at different levels of precision to compare archaeological cases at different spatial scales.

[182] *Spring Creek Drainage—Geoarchaeological Explorations along the Southern High Plains Eastern Escarpment, Northwest Texas*

The Spring Creek drainage, part of the upper Brazos River system, is located along the Southern High Plains eastern escarpment breaks near Post, Texas. Steep and confined vertical channel incision typifies the breaks and the drainage is and was fed by numerous springs emanating from the Ogallala Formation. Geoarchaeological research along a 774m transect from Macy Fork to 222m below its confluence with Spring Creek proper has documented a continual depositional record spanning the latest Pleistocene to early Holocene (~12,000–8,000 rcy BP). The stratigraphy records the shifting form and capacity of the drainage. The sedimentary record indicates a change from fluvial sands and gravels to spring fed pond and marsh deposits. The distribution of diatomaceous sediments suggests an ~200m-diameter pond formed during the early Holocene at the confluence of Spring Creek and Macy Fork. Slopewash colluvial deposits cap the sequence in upper Macy Fork. Fieldwork documents a diverse late Pleistocene biota and the presence of Clovis to late Paleoindians. The Spring Creek drainage provides the setting for a robust exploration of multiple facets of the Pleistocene-Holocene transition as well as comparison with the Southern High Plains regional record.

[196] *Beyond the Final Frontier: Time and Materiality in the Peripheralization of Bronze Age Eurasian Steppe Pastoral Societies*

Archaeologists studying prehistoric Eurasian steppe pastoral lifeways often seek inclusion into comparative research of urbanism, craft production, and complexity. Even as these studies contribute valuable information, they also reify their place in the intellectual periphery of archaeological inquiry. This peripheralization is due to several factors. First, the Eurasian steppe is perhaps unwittingly conceptualized as a relatively timeless socio-geographical periphery to “state-level” social entities located to the adjacent south—western Asia, south-central Asia, and east Asia. Second, this peripheralization is ultimately a spatially-derived frame of mind, one that essentializes and promotes geographic and cultural space over equally important considerations of time and materiality. In the following paper, I interrogate the spatio-centric mindsets that permeate current studies of Eurasian steppe pastoral social groups; a mindset that contributes to the further marginalization of pastoral-based case studies in anthropological archaeology. To break out of this exclusionary mindset, I explore the ways in which meaning was made in Bronze Age pastoral groups through a more inclusive inquiry drawing upon ethnographic and archaeological case studies to illustrate how pastoralists engaged with time and materials (as well as space) as they undergo periods of social change and continuity.

Johnson, John (Santa Barbara Museum of Natural History)

[136] *Cave Rituals in South Central California: Ethnographic and Archaeological Interpretations*

Two different versions of a myth, one Kitanemuk and one Kawaiisu, recount the tradition of a man taken into a cave where he was instructed in sacred knowledge by animal spirits. Neighboring Chumash and Yokuts elders passed along accounts of caves being used for shamanistic purposes, in part associated with rock paintings. These ethnographic accounts imply the private use of caves for special rituals by individuals. Nonetheless, there are particular Chumash pictograph sites that appear to have been decorated for public viewing. Many researchers have argued that some were locations where sunrises or sunsets were observed during the winter or summer solstices. A survey of these sites and associated sunlight phenomena test the hypothesis that these exhibit a consistent pattern of purposeful use.

[282] *Regional Solidarity, Ethnic Diversity, and Family Networks: The Bioarchaeology of Belonging and Exclusion in the Tiwanaku Colonial Enclave in the Moquegua Valley, Peru*

During the Middle Horizon, disparate communities in the south central Andes embraced Tiwanaku corporate culture to signal their affiliation with the Tiwanaku state, yet these communities also maintained separate regional and ethnic identities through distinct cultural practices. The archaeological record of the Moquegua Valley, Peru, provides an important opportunity to evaluate processes of belonging and exclusion within Tiwanaku society. Previous research indicates members of two Tiwanaku-affiliated communities in Moquegua, Omo-style agropastoralists and Chen Chen-style agriculturalists, maintained distinct cultural identities despite living in adjacent settlements for several hundred years. However, recent biodistance research indicates that cultural boundaries did not prohibit gene flow between ethnic communities, and archaeological data from several sites are suggestive of co-residence and cultural hybridity.

This study uses bioarchaeological data from samples of human skeletal remains from five archaeological sites in the middle Moquegua Valley to develop a multiscale approach to Tiwanaku social organization. Dental anomalies and basicranial and temporal bone landmarks are analyzed to assess postmarital residence practices and evaluate how family networks traversed ethnic boundaries. Results are contextualized using mortuary and body modification data to consider how processes of exclusion and belonging evident in material culture and social practice structured sociality within Moquegua Tiwanaku communities.

Johnson, Nadia (Penn State)

[31] *Obsidian Exchange and Use in Early Formative Chalcatzingo*

In the Middle Formative, Chalcatzingo was one of Highland Mexico’s dominant settlements. At its peak, Chalcatzingo had a well-developed obsidian blade technology and established lines of trade with the Gulf Coast. Chalcatzingo’s role in the exchange of obsidian in earlier periods is less well understood. This paper combines geochemical sourcing and technological analysis of an Early Formative obsidian assemblage from Chalcatzingo in order to elucidate this role. Geochemical sourcing enables a better understanding of the exchange routes maintained by the emerging site, prior to its florescence, while analysis of lithic technology may reveal how blade technology arrived in Chalcatzingo, and the form in which obsidian was transported.

Johnson, Patrick

[255] *Authority via Mobility: Interpreting Yamasee Ceramics*

Yamasees worked as non-missionized laborers in Spanish Florida, raided for Charleston traders, fought to expand Georgia, lived with Creek Indians, and worked as diplomats and traders in Pensacola. Letters, speeches, and testimony demonstrate that this mobility—often leading them to outnumber local occupants—allowed Yamasees to dictate terms to and take vengeance against other Native Americans as well as Europeans. Despite such authority, pottery assemblages demonstrate the frequent adoption of local practices. In so doing, Yamasees demonstrate that assemblages do not necessarily identify communities and that communities may gain local cohesion and regional authority by adopting new practices.

Johnson, Rachel (Tulane University)

[249] *Animism and Agency in the Amazonian Landscape: A Consideration of the Ontological Turn Utilizing Perspectives from Modern Runa Communities*

Modern Kichwa-speaking Runa peoples inhabit much of Ecuador’s Upper Amazon. Ethnographic study focusing on Runa communities of both the Pastaza and Napo Rivers indicate these groups share many of the views, collectively known as Amazonian Perspectivism, that characterize numerous lowland cultural groups. This paper will detail some of the ways in which Runa persons perceive and interact with their environment, focusing on relations with socially salient plants and animals thought to be persons, or rather, former persons who became distanced from human society through quilla, or “laziness.” I will argue that these interactions are an important form of social and economic adaptation within a broader ontological framework in which human–nature relations take on a highly social quality. This paper will also link modern perspectival views to the archaeological past through the consideration of the ontological turn, which posits that the ancient past may be best understood through the use of modern non-western ontologies. I argue that, at present, the application of non-western ontologies is complicated by the problematic creation of theoretical abstractions grounded in such ethnographic analogy.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Johnson, Susannah (Utah Valley University) and Karen Schollmeyer (Archaeology Southwest)**[91]** *Gaming Pieces in the US Southwest*

Tabular pieces of worked bone, commonly referred to as gaming pieces, have been found in archaeological sites throughout North America and the US Southwest. This project focuses on gaming pieces in Southwestern archaeological sites, with an emphasis on the Gila River basin. Data on gaming pieces in this area are compared to the Great Basin and surrounding regions, where much of the current research on these items has been focused. The analysis and comparison of context and other characteristics of known occurrences of gaming pieces in the Southwest informs a larger picture of how these gaming pieces may have been used in the past.

Johnston, Kevin [18] see Paine, Richard

Johnston, Susan (George Washington University)**[144]** *Ireland in the Iron Age: Interaction, Identity, and Ritual*

The relationship between Ireland and both Britain and continental Europe has often, both explicitly and implicitly, cast Ireland as either subsumed under the "British Isles" or as being "peripheral" to cultural life there and on the Continent. This terminology simultaneously ignores the unique aspects of Irish social and cultural life while suggesting that any study of culture there is not relevant to a broader understanding of the human experience. However, the archaeological record suggests a situation which is more nuanced and so more complex than this terminology would imply. Ireland clearly participated in a wider cultural world while also expressing its own unique identity. These issues will be explored specifically in the context of Iron Age ritual in Ireland, where evidence suggests that cultural and social identity were being actively fashioned. Using data from excavation at the Iron Age ceremonial center of Dún Ailinne, Co. Kildare, it will be argued that ritual in this period both tied Ireland to a larger Iron Age world while providing a medium in which to create a new context for political and ritual life that differed from that emerging in Britain and beyond while still being situated in international social trends.

[197] *Discussant***Jolie, Edward (Mercyhurst University)****[139]** *Threads from the Present and the Past Come Together in Smithsonian Collections*

In North America, some of the largest and most well preserved archaeological collections of perishable artifacts, including objects such as string, nets, baskets, textiles, mats, and sandals, are curated by the Smithsonian's National Museum of the American Indian and National Museum of Natural History. Generally poor preservation of these items has challenged interested researchers to recover as much information as possible from them, meaning that even some of the very early, minimally documented assemblages can make important contributions. At the Smithsonian's NMNH and NMAI, the availability of such material, combined with extensive collections of ethnographic weavings, facilitates engagement with both ancient and contemporary weaving traditions in ways that helps maximize what we can learn from the limited archaeological record. Drawing on long-term work with Smithsonian collections, this presentation considers first the insights obtained from a study of little-known historic Plains coiled gambling baskets with implications for understanding the precontact origins of that complex. Second, I review results of research on prehispanic Chacoan (ca. A.D. 850–1150) perishables from New Mexico that has yielded new data about these crafts in Chaco Canyon and beyond, and which also raises interesting new questions about recent Pueblo peoples' weaving traditions.

Jolie, Edward [48] see Lee, Craig

Jones, Alexandra (Archaeology in the Community)**[148]** *Discussant***Jones, Catherine (University of Wisconsin-Milwaukee)****[107]** *The Problem of Enacting Ethical Practice in Historic Cemetery Excavation*

The excavation, reburial, and permanent curation of human remains from historic cemeteries is inherently linked to complexities of Western paternalism, medical consent, nationality, traditional cultural practice, and a too-common absence of stakeholder engagement, among other pressing concerns. These important and fundamental considerations are often ignored or glossed over in both archaeological project planning and in publications utilizing these remains. The ideal of scientific objectivity inherently separates the researcher from the material, a suitable principle for particle physics but not for human remains. In order to ensure that active engagement in ethical discussion is a continual practice and not a cyclical concern-of-the-moment, we as researchers must consciously embrace the full range of our position as social actors as we seek to embrace a multiple consciousness at the intersection of divergent modern communities and judicious excavation.

Jones, Emily Lena (University of New Mexico), Cyler N. Conrad (University of New Mexico), Caitlin Ainsworth (University of New Mexico) and Stephanie Franklin (Santa Fe National Forest)**[115]** *Turkey Husbandry at Pueblo Bonito and Its Relationship to Turkey-Human Interactions in Chaco Canyon*

Domestic turkey (*Meleagris gallopavo*) husbandry at Chaco Canyon has been the subject of considerable debate. Previous research has argued, among other things, that turkeys were rare in the Canyon (Akins 1985); that turkeys first were a source of feathers for ritual and ceremonial activities, and only later treated as food (Akins 1985; Badenhorst et al. 2016; Windes 1977); that local wild turkeys were not present in Chaco Canyon and domestic turkeys were imported from the Four Corners region (Vivian et al. 2006); and that local domesticated and/or wild turkeys were husbanded within the canyon (Grimstead et al. 2016; Speller 2009; Speller et al. 2010). In this paper, we use turkey bone and turkey eggshell remains recovered during the 2013 re-excavation of Room 28 at Pueblo Bonito to address some of these controversies. Our results suggest that turkeys were likely husbanded at Pueblo Bonito (and possibly elsewhere at Chaco as well), and that site excavation histories may be biasing our interpretation of the turkey-human story at Chaco Canyon.

Jones, Eric (Wake Forest University)**[119]** *A Multiscalar Analysis of Piedmont Village Tradition Settlement and Demography, 1200–1600 CE*

This research uses settlement area of Piedmont Village Tradition (PVT) sites from the four major river valleys in the North Carolina Piedmont to describe demographic trends on multiple scales during 1200–1600 CE. It uses surface survey results and artifact styles to establish sizes and dates. Spatial data and radiometric dates from excavated sites in each valley are used to refine these data. Given the limitations of using surface survey data for estimating demographic characteristics, this work aims to establish an initial model for population sizes and changes in the Piedmont on several scales that can be tested and improved upon in the future. Previous work suggests population growth occurred across the valleys from 800–1200 CE. Findings in this research suggest that populations in different valleys experienced different trajectories during the subsequent 400-year-period. Intra-

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

valley migrations and eventual abandonment marked the Yadkin; population growth, settlement coalescence, and eventual abandonment in the Dan; and population stability and settlement coalescence in the Eno and Haw. Contextualizing PVT demography in the larger Southeast will help us understand how small-scale societies compared to neighboring chiefdoms, chieftaincies, and confederacies and what that means for the relationship between sociopolitical form and different demographic trends during this period.

Jones, Garrett (Morehead State University / The Craft Academy), Timothy Hare (Morehead State University) and Mike Dowell (Mobile Recon Systems LLC)

[190] *An Integrated Heavy-Lift Unmanned Aerial Vehicle (UAV) and Remote Sensing Platform*

We describe an integrated heavy-lift unmanned aerial vehicle (UAV) and remote sensing platform used to map archaeological features under the forest canopy in the northern Yucatán. We collaborated with Mobile Recon Systems Inc. to construct a UAV-based aerial mapping system that can be used to create high-resolution maps and 3D models of archaeological ruins, excavations, caves, and cenotes for small to medium-sized areas of the forested environment. The system integrates Light Detection and Ranging (LiDAR) and multispectral sensors with RGB light cameras into a large UAV for simultaneous recording of visible light, near-infrared, and topographical data. The major components include the UAV, sensors, inertial measurement unit, dual channel GNSS receiver and base station, radio transmitters, control points, and mission control equipment and software. Our goal is to create a practical and cost-effective system to facilitate rapid and accurate mapping of archaeological remains and associated environmental features.

Jones, J. Scott (University of Kentucky)

[127] *Paleoindian Site Formation in the Tennessee River Valley*

The Paleoindian occupation of the unglaciated eastern woodlands has generally been characterized by distributions of projectile points and few true sites. While this perception has begun to change in recent history, the Late Pleistocene archaeological record beyond projectile points including sites and settlement patterns remain poorly studied and reported. This paper provides an evaluation of the natural and cultural formation processes associated with Paleoindian occupation in the Tennessee River Valley. Natural process emphasize dynamic environmental conditions, coupled with resource availability, primarily including changes in riverine drainage dictating Paleoindian site location. The cultural processes involved in site formation have often been juxtaposed as aggregations of small bands of highly mobile hunter-gatherers vs. re-occupation by single bands of hunter-gatherers. Evaluation of the data derived from the Late Pleistocene Carson-Conn-Short site (40Bn190) in the Lower Tennessee River Valley suggests other factors beyond the traditional aggregation/re-occupation models are important in site formation. The data presented here also raises important implications for modeling the development of sedentism and horticulture in the Midsouth.

[274] *Early Settlement on the Island of Grenada: Ecological Evidence for the Extinction of Rodents and Palms*

Evidence of Archaic age settlement with possible rodent harvesting is apparent in two well-dated sediment cores collected in northeastern Grenada. At around 3600 BC, large scale burning on the island coincides with severe forest modification including the total elimination of at least two species of palms. The selective, though possibly unintentional, removal of economically valuable palms suggests the influence of a non-human variable into the equation. I propose that the removal of a seed-dispersal agent, possibly an agouti or a hutia, might play into the removal of these palms, already in a weakened state due to large scale human-caused fires.

[81] *Paleoindian and Early Archaic Southeast: Twenty Years of Georgia Archaeology*

In the twenty years since the O'Steen and Ledbetter et. al chapters in *The Paleoindian and Early Archaic Southeast*, a great deal of work on the earliest occupations of Georgia has occurred. In this paper, we review recent fieldwork and collections research that have contributed to our understanding of Georgia's early record, update distributional data of Paleoindian and Early Archaic diagnostics across the state, and compare this diagnostic distributional data with raw material distributions across the state. We then use this data to consider models for the Pleistocene and Early Holocene occupations of Georgia, paying close attention to raw material distributions and possible implications for shifting group interaction patterns over time.

Jones, Kelly (Florida Gulf Coast University) and William Locascio (Florida Gulf Coast University)

[52] *A Typology of Late Archaic Ceramic Evidence from Okeechobee Basin to Determine Regional Interactions*

Analysis of ceramic sherds collected during excavations at the Wedgworth Midden (8PB16175) permits insight into regional interactions during the Late Archaic period. Saint John's Plain, a chalky ware associated with people to the north of the Okeechobee Basin, constitutes a significant proportion of the assemblage and suggests that Late Archaic communities in the Northern Everglades maintained social interactions with people living in the St. Johns River Valley. While preliminary, these patterns offer evidence that south Florida cultures were involved in local and non-local activities that might have included exchange of resources and ideas during the Late Archaic period.

[241] *3D Geometric Morphometrics Applied in the Identification of Canis spp. Specimen from a Historic Site in Western Texas*

Whiskey Flats, an archaeological site on the Llano Estacado (western Texas), is dated to the mid-18th century and represents Comanche occupation. Ongoing fieldwork has produced a vertebrate assemblage that includes coyote (*Canis latrans*) and a larger canid (*Canis* spp.) of a species that remains undetermined. The species of canids that may have been present at the time of deposition are grey wolf (*C. lupus*), coyote, domestic dog (*C. lupus familiaris*), and possibly red wolf (*C. rufus*). The *Canis* spp. is represented by a small, non-diagnostic sample (n=15). In the absence of diagnostic elements such as a skull or mandible, three-dimensional landmark-based morphometric analysis is applied to the right astragalus to determine the viability of the specimen as an indicator of species. Principal component analysis (PCA) is performed using astragali from modern comparative samples of grey wolf, coyote, dog, and red wolf in an attempt to characterize quantitative variation and ultimately, determine if species identification is possible. The methodology has proven useful in exploring the range of variation among the canid species and results indicate that *C. latrans* is the least likely candidate. Dog or red wolf would prove significant, the former culturally and the latter in range and habitat.

[334] *Archaeology at Camp Michaux: A Productive Collaboration between Dickinson College, Cumberland County Historical Society, and Governmental Agencies in Cumberland County, Pennsylvania*

Since 2013, the Dickinson College Archaeology program has partnered with the Cumberland County Historical Society, the Pennsylvania Historical and Museum Commission, and PennDOT to conduct research in the Camp Michaux area of Michaux State Forest (Cumberland County, Pennsylvania). This partnership functions through the Archaeological Methods course offered by the college each spring, which teaches students how to plan and

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

execute their own small research projects involving remote sensing, pedestrian survey, feature mapping, and test pit excavation. Students design their investigations around questions about one of the multiple phases of occupations at the site: Prehistoric/Indigenous, Farm/Iron Furnace, Civilian Conservation Corp Camp, and WWII Prisoner of War Camp. Despite time constraints and other limitations inherent in the nature of a semester-long class, yearly public presentations that involve the local community disseminate new information about what was learned and improve public understanding of the site. The partnership between Dickinson College and local heritage and government agencies has proved successful in working towards the preservation of regional archaeological and cultural heritage resources, while continuing to look toward the future of the project.

Jones, Mica (Washington University in St. Louis) and Ruth Tibesasa (University of Pretoria)

[198] *Bridging the "Kansyore gap": Continuous Occupation and Changing Subsistence Strategies at Namundiri A, Eastern Uganda*
Environmental heterogeneity and climatic instability in the mid-Holocene (~8,000–3,000 BP) are linked to increased socioeconomic diversity in East Africa. Increasing aridity ca. 6,000–5,000 BP encouraged early herders to migrate south into the region, while local hunter-gatherers intensified their reliance on ecologically-rich environments. Kansyore hunter-gatherers of the Lake Victoria basin established specialized subsistence systems that incorporated heavy pottery-use and seasonal site occupation at this time, possibly in response to decreasing rainfall. A gap in the archaeological record, however, limits understandings of Kansyore strategies in relation to environmental reorganization. Evidence from western Kenya suggests Early (~8,000–6,000 BP) and Late phase occupations (~3,500–1,500 BP) associated with changes in the frequency of pottery production/use, ceramic style, and fishing strategies, yet no evidence exists for Kansyore activities between these periods. Recent excavations at Namundiri A in eastern Uganda reveal a long archaeological sequence without breaks in the stratigraphic or material record. Faunal and ceramic data shows clear patterns of subsistence change similar to those observed between the Early and Late Kansyore, suggesting that this Kansyore "gap" is the result of incomplete radiometric data and a dearth of targeted research in the region, rather than a break in occupation during the mid-Holocene.

[209] *Possible Maya Analogs and Antecedents for the Pyramid B Atlantid Columns, Tula*
Classic Maya stelae have been proposed as precursors for the Early Postclassic stelae at Tula and the relief pillars of Pyramid B at the site in previous scholarship. While suggested Maya connections for the Tula stelae are often overstated, and local central Mexican stela traditions as well as ideas from Oaxaca and Guerrero also probably contributed to the genesis of these monuments, the role of Maya contacts remains plausible. Here I explore possible Maya analogs, including stelae, for the famed atlantid columns of Pyramid B. While in style and construction these sculptures reflect the legacy of Teotihuacan, their use of elite or royal images as literal pillars has conceptual parallels in Classic Maya stelae equating kings with trees, pillars of the sky and the axis mundi. I also critically assess the possible connection, first proposed by Kubler, between the Tula atlantids and the Terminal Classic figure columns of the Puuk area. While these similarities may reflect a common Mesoamerican background rather than direct contact, recent dating of the Tula sculptural style to 650–850 CE at Tula Chico increases the probability of interaction.

[308] *Roman Slavery*

In the last 20 years, Roman archaeologists have analyzed the remains of Roman streets, counted graffiti, benches, and doorways in Pompeii and Herculaneum, and mapped the spaces of houses, workshops, and villas, and examined as well as the location of objects. Archaeologists have turned the material remains into facts and assembled an archive of the traces of human activities—traffic, movement, work, rituals, etc. How this scholarship has furthered our understanding of a heterogeneous population of men and women, rich and poor, free and slaves, Romans and foreigners is another matter. In *The Material Life of Roman Slaves*, Lauren Petersen and I sought to retrieve and represent the physical environment and lives of Roman slaves by setting in dialogue the textual record of Roman law and literature on slaves and the archaeological remains and by drawing on the work of archaeologists and historians of slavery in other periods and places. I want to focus on the Haitian historian and theorist Michel-Rolph Trouillot to Roman archaeology. The goal is to think about what counts as facts, the interpretation of those facts, and how some interpretations are regarded as factual history while others are seen as works of fiction.

[244] *The Trouble with the Curve: Reassessing the Gulf of Mexico Sea-Level Rise Model*

During last glacial episode, a massive amount of water was locked within ice sheets, resulting in a reduction in global sea-levels by 134 meters. The reintroduction of freshwater into the oceans radically changed global sea-levels and littoral landscapes. Over the last 20,000 years, approximately 15–20 million km² of landscape has been submerged worldwide. Sea-level rise explains the rarity of glacial period coastal archaeological sites. Understanding Florida's Paleoindians' interactions with the coastal environment requires an accurate sea-level curve for the Gulf of Mexico. Balsillie and Donoghue (2004) sea-level curve has been the standard model for oceanic transgression in the Gulf for over a decade. Yet, when compared to global sea-level curves, there are discontinuities within their model. This paper will address the issues with Balsillie and Donoghue (2004) curve, introduce new data and methodologies to enhance the Gulf of Mexico sea-level curve, and improve distribution modeling for submerged archaeological sites.

[59] *Sourcing Pre-ceramic obsidian from Las Estacas, Morelos, and Yuzanu 36, Oaxaca*

Understanding of long-distance exchange during the Mesoamerican Pre-ceramic suffers from a limited range of materials whose source locations can be determined relative to later periods. Obsidian is one of the few materials that can provide evidence for long-distance exchange through geochemical analysis, although relatively few sourcing studies have been carried out on Pre-ceramic obsidian. In this paper, we report recent pXRF results from

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

obsidian recovered at two Preceramic sites: Las Estacas, an Early Archaic period site in the Yautepec Valley of Morelos, and Yuzanu 36, a Late Archaic site from the Nochixtlán Valley, Oaxaca. Our results show that in each case a single obsidian source predominates, with at least 94% of the Las Estacas sample (n=100) from Otumba and 100% of the Yuzanu 36 sample (n=31) sourced to Guadalupe Victoria. We compare the results from Las Estacas and Yuzanu 36 to Preceramic and Early Formative period obsidian sourcing data from elsewhere in Mesoamerica. Data for the Preceramic and initial Early Formative indicate that in most cases obsidian procurement was focused on a small number of sources with procurement diversifying by the later Early Formative. We discuss the implications of the evidence for means and patterns of obsidian exchange.

[139] *Archaeology in and with Museums: A Case Study from Honduras*

Archaeology in the US is undergoing a series of transformations, emphasizing community engaged scholarship, new research questions of contemporary relevance dealing with such things as resilience, social memory, and production of historical identity, and a shift towards non-invasive methods and intensive analyses of smaller samples from more limited excavations. Yet the normative vision of archaeological research still is original excavation of a site selected purposively to answer a question, sampled by predetermined strategies. Research with previously collected materials, especially in older museum collections, is not often presented as potentially a normative option for theses and dissertations. My own research encompasses settlement survey, excavation, and materials analyses under the normative model of archaeological research, as well as use of curated collections. In this presentation, I will describe highly productive research on Honduran archaeology that the collections of the National Museum of the American Indian at the Smithsonian have made possible, emphasizing the kinds of questions that the museum collection allows me to address that were not feasible without its holdings. I explain several strategies used in this research to provide contexts for interpretation, emphasizing the interplay between smaller, tightly controlled excavated samples and the larger collections in the museum.

[18] *The Creation of Late Preclassic Urban Landscapes at the site of Noh K'uh in Chiapas, Mexico*

The site of Noh K'uh in Chiapas, Mexico is a mid-sized ceremonial center that is found near the boundary between the Southern Lowlands and the highlands of Chiapas. Abandoned during the Late Preclassic (400 B.C.- A.D. 200), the site of Noh K'uh has provided an opportunity to study the Late Preclassic settlement patterns without the overburden of later period remains. Recent investigations in 2016 and 2017 have provided new evidence that allows me to compare the construction techniques utilized in different areas of the site, ranging from the ceremonial core to the humblest occupations. Combined with previous data, the city of Noh K'uh reveals a construction program that was responsible for forever altering the landscape

that supported the site. Survey and excavations over commoner contexts provide evidence that such activities were guided by cosmological rituals, especially the common practice of centering.

[335] *Across the Lake: Interregional Connections with the Tiwanaku Occupation of Copacabana*

Tiwanaku, the first expansive state in the southern Andes, established colonies in many parts of the Andes (Moquegua, the Atacama Desert, Cochabamba) and exerted influence over the southern Titicaca basin. Archaeologists have recreated daily life for people living in these places, producing many insightful studies of Tiwanaku diet, cultural bodily modifications, disease, and occasional incidents of trauma. Many colonists living far from the Tiwanaku heartland developed hybrid lifestyles, adopting some local practices while preserving other Tiwanaku traditions. The site Cundisa is located in modern-day Copacabana, approximately 60km across Lake Wiñaymarka and 90km over land from Tiwanaku. Cundisa includes a cemetery with Middle Horizon burials of 100+ individuals. While the majority of individuals were buried with Tiwanaku ceramics, isotopic and skeletal evidence suggests variation in geographic origin and lifestyles for the people buried here. In this paper, we present the results of preliminary skeletal analyses of diet, disease, trauma, and identity for these individuals and suggest the variation present in the sample indicates interregional connections between Copacabana, Tiwanaku, and the coast. This interaction is likely part of the larger processes of the Middle Horizon, when long-distance trade and movement of peoples stimulated social complexity across the Andes.

[302] *The Teeth Tell All: Dentition, Demography, and Paleopathology at Early Classical Mayan Site of Tulix Muul, Belize*

In 2013 a rescue mission to salvage and preserve details of the shrine complex at Tulix Muul, a Classic Maya site in northwestern Belize, yielded a Maya mural. While the arrangement of the mural at the shrine echoes notions of nobility, this rare landmark discovery lies in contrast to what we can infer about the social status of exhumed remains from the Tulix Muul archaeological site. This poster will address the multifaceted insights we can glean from certain aspects of the past life histories and social identities of the residents of Tulix Muul. An analysis of the dentition from thirteen burials illustrates how non-specific indicators of health (NSIH) relate to the varying tiers of class among Early Classic Maya communities in northwestern Belize. Subsequently, comparing these results alongside contemporaneous finds from the neighboring site of Blue Creek will emphasize the biocultural impact of class-based dietary disparities reflected in the bioarchaeological record of two communities a mere 30 kilometers apart.

[171] *The Role of Short-Term and Catastrophic Climatic Events and Human-Induced Landscape Change in Society Island Cultural Transformations*

As studies of sustainability and resilience in pre-contact Polynesian societies proliferate, records of small-scale and large-scale environmental change are being refined. Yet the question of what drives social change, human actions or climatic factors, is still quite hard to discern. My case study focuses on non-human agency, particularly eroding landforms and climatic conditions, as forces of change in pre-contact East Polynesia. A Society Island case study outlines varied human responses to expected events, such as soil creep onto agricultural terraces, and cataclysmic ones, such as major landslides, tropical cyclones, and flooding. Some cataclysmic events had remarkably deleterious short-term effects, but in the long-term created more advantageous residential and agricultural conditions for the indigenous Ma'ohi. Other short-term cataclysmic events were successfully buffered with new adaptations, spurring cultural innovation. Ma'ohi efforts to combat soil erosion, due to both natural and human causes, led to remarkably labor-intensive inputs into the pre-contact socio-economic system. From a behavioral ecological perspective, both nature and culture shaped Ma'ohi habitats. East Polynesian case studies support that decision makers often lacked information about the long-term consequences of their actions, yet could sometimes rapidly adapt and integrate new forms of traditional ecological knowledge into their socioecosystems.

[84] *Sea Level Rise and Shell Mound Inundation within the Islais Creek Estuary, San Francisco, California*

Situated on the southeast edge of San Francisco, the Islais Creek estuary was infilled during early development of the city. Recent geoarchaeological coring searching for prehistoric sites underlying this urban landscape has documented a complex sequence of Holocene landforms deposited as sea level rise transformed the ancestral Islais Creek valley. This exploratory work also identified, in a variety of stratigraphic contexts, an extensive ancestral Native American shell mound that was occupied throughout most, if not all, of the Late Holocene. Sea level reconstruction indicates that the oldest site component was formed just above the tidal range at the time of occupation, was subsequently submerged, and is now situated over 6 meters below surface and overlain by estuarine mud. In response to progressively rising sea levels, later temporal components of this shell mound were formed at increasingly higher elevations. Paleoenvironmental analysis of diatoms and pollen reveal that during the Middle Holocene this estuary was largely freshwater, and transitioned to brackish conditions beginning around 5000 years ago. The timing of this transition raises several new questions regarding the nature of earlier adaptive strategies around the estuary and appropriate techniques for identifying older sites within this deeply submerged and buried landscape.

[171] *The Agency of Monsoons in South Asia*

Every June through September, the inhabitants of South Asia welcome and celebrate the southwest monsoons. The monsoon winds are the lifeline of this region but also a major threat, inspiring societies to devise mechanisms to both harness their potential and subvert the damage they may cause. This paper analyzes prehistoric and historical responses to monsoons in South Asia in terms of their unpredictable nature, and examines how the monsoons both facilitate and constrict people's actions. In doing so, the paper compares societal responses to monsoons in the different contexts of rurality and urbanity, which each exert specific exigencies over individual and collective actions. In both situations, conserving seasonal rainwater is crucial to the sustenance of societies but an excess of that water can cause significant destruction. Poets of the past and the present allude to the vagaries of the monsoons, reflecting a society conscious of monsoons' deceits, but even today, it is nearly impossible to predict how much it might rain, when, and where. The paper thus urges archaeological studies of water infrastructure to take into consideration both human agency and the agency of the monsoons.

[87] *Parents, Infants and Material Culture*

A study of over 50 U.S. parents of infants that included interviews and the recording of toys and living spaces shows that material culture does provide clues to both parental beliefs and behaviors, but, not surprisingly, the reflection is imperfect. The material presence of infants is considerable, but even in relatively affluent households much of it is often second hand and gifted, so may not directly reflect the espoused beliefs of parents. This is especially true of objects reflecting gender stereotypes. In addition, even infants interact significantly with objects that are designed for adults and adult activities rather than designated as specifically for infants or children.

[172] *Beyond Solutionism? Digital Data and Threatened Cultural Heritage*

In his influential book "To Save Everything, Click Here" (2014), Evgeny Morozov coined the term "solutionism" to describe a utopian vision that innovation in digital technologies can solve complex social problems. Fueled by Silicon Valley wealth, digital technologies have an obvious glamor. The high-profile reconstruction of the Palmyra Arch by the Institute for Digital Archaeology exemplifies how governments, universities, corporate sponsors, and granting foundations use media attention on threatened world heritage to showcase technological prowess. Do such efforts meaningfully preserve threatened heritage? Do they overshadow often tragic social realities that fuel war and other causes of heritage destruction? How likely are the data to be available, discoverable, and of any future use?

To move beyond solutionism, this paper highlights how digital data need better contextualization. Context is multi-dimensional—simultaneously physical, social, and intellectual. Contextualization requires developing "human capital" through community archaeology and public education, and sustained institutional commitments for digital curation. Such efforts cannot be siloed institutionally, intellectually, or technologically. Open Context (<http://opencontext.org>) illustrates approaches to link and integrate heritage data across institutional and community boundaries in ways that can encourage continued development of the human capital needed to make digital cultural heritage a meaningful aspect of preservation.

[130] *Considering Communities of Practice throughout the Data Lifecycle*

The use of digital tools for data creation and presentation is pervasive in archaeology, and data preservation and dissemination is becoming common practice. Still, few archaeologists consider the life of their data beyond their own research purposes. This lack of broader consideration of the future uses of a dataset means that many researchers do not sufficiently describe their data to make it intelligible or useful to others, which risks filling repositories with data of very limited use. We present findings from the Secret Life of Data (SLO-data) project, which aims to better understand opportunities and challenges in data interpretation, publication and preservation by following the lifecycle of data from the field to the digital repository. The project's "slow data" approach emphasizes the need for thoughtful consideration of archaeological data, taking into account its curation, contextualization, and dissemination, as well as how it can contribute to broader understanding now and in the future. We share results from interviews, field observations, and excavation data assessments that our team has conducted at four field sites in three continents. We recommended technical and organizational changes to streamline data collection and management during excavations that will help improve its potential for future use.

[139] *Materials Characterization at the National Museum of the American Indian: (Mostly) Non-destructive Analysis*

The use of portable X-Ray Fluorescence (pXRF) for in-situ elemental analysis is becoming widespread in archaeology and cultural heritage studies. Archaeologists and conservators routinely use pXRF instruments in the field and many museums use them in-house for identification of pigments, metals, and inorganic pesticide residues, characterization of minerals and determination of alloy composition. The NMAI Conservation Department has been using pXRF for over fifteen years for a variety of materials and projects. Focusing on results of a long-running technical study of polychromed Inka and Colonial Andean ritual drinking vessels called qeros, I present an overview of the utility of pXRF in the museum context. Identification of the palette of mineral pigments and metal decoration and repairs used for the qeros has contributed substantially to our understanding of chronology and production. I include examples of studies carried out at NMAI of modern, historic and archaeological collections items and discuss the value and limitations of pXRF when used alone or in combination with other analytical techniques.

[219] *Numerical Modeling of Hunter-Gatherer Population, Dispersal, and Influence on the Environment in the Late Pleistocene*

The expansion and dispersal of modern humans across Eurasia and into the Americas during the Late Pleistocene is remarkable for the application of niche construction, contemporaneous with megafauna extinctions and rapid climate change. Despite the importance of this period, the rate, pathways, and environmental impacts of the late Pleistocene human dispersals are poorly understood. To quantify the effects of these dispersals on the environment, and to better understand demographic development over the period, I implemented a new, computationally efficient numerical representation of human population dynamics and dispersal and incorporated this into a dynamic global vegetation model. This coupled model of human and natural systems simulates the way in which climate and other properties of the physical environment affected suitability for hunter-gatherer populations, while at the same time allowing humans to modify their local environment, i.e., niche construction, through the controlled application of wildland fire. Our model simulations show that humans could substantially influenced their environment even during the Last Glacial Maximum, selectively using fire to promote more open and heterogeneous landscapes. This anthropogenic modification of the land surface facilitated further dispersal and increases in population, a positive feedback that ultimately accelerates the growth and spread of humans across the planet.

[17] *Political Economies of the Wari Empire: Resource Use in the Middle Horizon, Peru*

Political economies, or the "material foundations" for the institutionalization of power and control are complex and variable, within and across resources, political systems and incorporated communities (Earle 1994). During the Middle Horizon, Peru (AD 600–1000) the Wari Empire expanded from its capital in the Ayacucho highlands to cover a region of the Andes spanning over 1000km within present-day Peru. The empire embarked on large-scale infrastructural projects (roadways, agricultural terracing and irrigation works, political and administrative systems, etc.) and had a political

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

economy built on a combination of strategies, including resource control and the specialized production and distribution of both utilitarian and special-purpose goods. The empire relied on the vertical ecology of the Andes to capitalize on regional resources, and to draw those regions into the Wari interaction sphere. This research seeks to understand the intersecting relationships between regions, resources and Wari power as enacted through the production, distribution and consumption of obsidian and other resources within the Wari capital and hinterland territories.

Kara, Alex (Boston University)**[28]** *Scrutinizing Theories of Maya Collapse with the CHAAHK Spatial Simulation Model*

The Classic Maya collapse remains as both relevant and controversial a topic as ever. For over a century, dozens of researchers have proposed different causes that may have driven this complex process. The last few decades have witnessed the academic community's opinion converge on the notion that many different social and environmental factors, operating at likewise diverse scales, somehow contributed to a temporally gradual and spatially heterogeneous disruption of the demographic, political, and cultural patterns known to have characterized the Classic Maya. This paper builds on this progress by attempting to quantify the relative influence of certain factors on the Maya region's long-term trajectory. It presents an abstract spatial simulation model of Maya demography, subsistence, and trade over a 3000 year period. It implements relatively generic manifestations of what processes were relevant to the growth, collapse, and regeneration of the Maya system. This abstraction permits quicker model execution times, which then facilitates using data mining and sensitivity analysis methodology to quantify how certain stressor categories contribute to the presence or absence of long term societal collapse. The relative importance of these stressors according to the simulation is then compared to the amount of research attention they tend to receive.

Karapandzich, Alina (The College of Wooster) and Paul Nick Kardulias (The College of Wooster)**[185]** *Zero to Hero: Elite Burials and Hero Cults in Early Iron Age Greece and Cyprus*

Adulation of heroes, including the flawed, militaristic, authoritative men of Homeric epic was an important feature of ancient Hellenic culture. This phenomenon is reflected in cults and shrines built in the Archaic period. How did these so-called "hero cults" form, and can Early Iron Age (EIA) elite burials form a connection between the tomb cults of the Late Bronze Age (LBA) and the hero cults of the Archaic and later Classical periods? The purpose of this study is to examine EIA burials whose elite goods and archaeologically visible tombs reflect the burial of a "heroic" person. In doing so, we draw connections between the elaborate LBA burials and the less ornate EIA interments of Greece and Cyprus that contain references to the LBA past. To examine this phenomenon, we consult theories of state formation, the cyclical nature of changing levels of social complexity, and cultural memory. In order to draw connections between Archaic hero cults and earlier EIA tombs, we examine burials at the following sites in Greece and Cyprus: Pylos, Tiryns, Mycenae, Athens, Lefkandi, Grotta, Phylakopi, Knossos, Mesa Moulana, Amathus, and Salamis. Additionally, Homer's Iliad and Odysseus and Hesiod's Theogony provide documentary evidence to accompany the archaeological material.

Karavanic, Ivor and Antonela Barbir (Croatian Conservation Institute)**[304]** *An Integrative Approach to Cave, Open-Air and Underwater Mousterian Sites of Dalmatia (Croatia)*

Paleolithic sites situated in the Hrvatsko zagorje region of north-western Croatia (Krapina, Vindija) are well known because they contain important finds of fossil human remains associated with both faunal remains and lithic industry. However, in recent years, work on Mousterian sites in Dalmatia (south Croatia) has intensified. It focuses on three types of sites, (caves, open-air, and an underwater site) as well as on a systematic survey of the region. This poster briefly presents one of each type of the site in the light of new research and compares evidences from these sites. While the cave site of Mujina pećina has yielded both lithics and faunal remains in a stratigraphic context, lithics from the Karanušići open-air site and the Kaštel Štafilić—Resnik underwater site were mainly collected from the surface. Although surface finds lack stratigraphic information, they contain some general technological and typological data, damage patterns, as well as information on sphericity and roundness of finds. This integrative approach to mentioned sites allows a comparison between land sites and those now under water, providing better insight into formation processes, a more complete picture of the area occupied by the Mousterian people and a clearer insight into their mobility patterns.

Kardulias, Paul Nick (College of Wooster)**[274]** *Multi-faceted Anthropology: Recent Work of the Athienou Archaeological Project in Central Cyprus*

The Athienou Archaeological Project (AAP) has conducted multi-pronged investigations in central Cyprus over the past 27 years. The research has included excavation, survey, geophysical prospection, ethnoarchaeology, bioarchaeology, and cultural studies. The unifying thread in these endeavors has been a theoretical perspective that draws on Braudel's concern with the central role of the environment in the Mediterranean's historical development, world-systems analysis, and landscape archaeology. Field research has examined an Archaic to Early Roman rural sanctuary, a Roman to Venetian era village, and a funerary landscape with tombs (Archaic to Venetian) scattered throughout the valley. Ethnoarchaeological research has focused on a recent Turkish village, traditional agricultural practices and tools, current herding practices, local water systems, and ephemeral sites for the production of charcoal and bee-keeping. Our team has also examined the role of historic preservation in consolidating a local identity linked to restored buildings, and efforts to maintain traditional crafts, such as the manufacture of lace and production of cheese. As John White emphasized throughout his career, the holistic scope of anthropology is necessary to understand the multiple dimensions of life in the past and present. That approach has been a guiding principle for the work of the AAP.

Karkanas, Panagiotis (The Malcolm H. Weiner Laboratory for Archaeological Science, ASCSA), Sharon Stocker (Department of Classics, University of Cincinnati) and Jack Davis (Department of Classics, University of Cincinnati)**[298]** *Microstratigraphic and Geochemical Contributions to the Study of the Burial Practices and Taphonomy of the Mycenaean Shaft Grave of the 'Griffin Warrior', Pylos, Greece*

Results of a microstratigraphic and geochemical approach are presented here in reference to study of the Mycenaean 'Griffin Warrior' shaft grave at ancient Pylos. Soil and sediment micromorphology are used to address questions concerning the preparation of the tomb, the mode of corpse deposition, and taphonomy of the burial. Processes and activities such as the preparation and configuration of the floor and other earthen constructions inside the tomb are considered, as well as the rapidity of episodes of backfilling both through human and natural agency. Overall, a microcontextual approach has revealed a more complicated burial history than recognized by field observations alone. Furthermore, the identification of neoformed minerals and their chemistry has enabled the detection of degradation products of human body tissue and probably also that of some of the associated cultural objects. The genesis of these minerals reflects the sequence of the opening and filling of the tomb and their identification, therefore, contributes to a more informed reconstruction of the history of the burial. The discovery of such chemical traces has important implications for their future identification in graves and our ability to distinguish between primary and secondary burials.

[295] *Mounds at the Margins: The Effect of Temporal Frontiers on Archaeological Interpretation*

The practice of building earthen mounds has tremendous time depth in the American South, and the variation in these monuments across time and space continues to spark debates regarding their functions and social significance. A great deal of attention has been focused on the shifting functions of mounds during Terminal Woodland / Emergent Mississippian times, when platform mound-and-plaza complexes become commonplace, corn agriculture becomes the norm, and higher levels of institutionalized status differentiation develop. In this paper, I define this transition as a “temporal frontier” and interrogate the effects of the period’s marginal position on its archaeological interpretation. In particular, I draw attention to the distorting effect of archaeology’s backward gaze in examining the changes that take place at temporal frontiers and advocate for a more forward-looking approach to the interpretation of these pivotal moments. My primary case study focuses on the Late Woodland Coles Creek culture (AD 700–1200) of the Lower Mississippi Valley and the interpretation of early platform mounds. Finally, I briefly consider how the concept of temporal frontiers may be used to better comprehend the archaeology of other transitional periods in United States prehistory.

[337b] *Ancestry and Heritage at a South Carolina Rice Plantation*

During the 18th and 19th centuries, Georgetown County in South Carolina housed some of the largest slave plantations and rice agriculture in the New World. Today, the descendants of these enslaved laborers form the Gullah Geechee community and comprise a distinct African-derived creolized cultural praxis. This study concerns itself with the long-term trajectory of biological and cultural change experienced by the individuals living in the South Carolina Lowcountry. First, ancient DNA extraction and sequencing methods, population genomic models, and bioinformatic tools are used to link a group of 19th C enslaved laborers from Hagley Plantation, Georgetown county to populations in west, central, and east Africa. Then, the genetic analysis is contextualized within the cultural and social systems of the ancestral populations and the particular colonial regime operating at Hagley. Using a biocultural approach, this study aims for a better understanding of lineages severed by the transatlantic slave trade, the formation of new kinship and social networks under slavery, and conceptions of ancestry and heritage.

[48] *A Preliminary Study of Epiclassic Human Mobility at Cerro Magoni in Tula, Mexico Using Stable and Radiometric Isotope Analyses*

In this poster, we present preliminary mobility data for ten individuals recovered from the summit of Cerro Magoni, an Epiclassic (ca. AD 600–900) hilltop settlement in Tula, Mexico. For decades it has been hypothesized that the Tula area may have experienced an influx of immigrants from northwestern Mexico during the Epiclassic period, and that these newcomers played an important role in the rise Tula Grande. Results presented here provide an important step forward towards testing the long-held migration hypothesis. Analyses of modern and archaeological faunal remains were conducted to establish local baselines for oxygen ($\delta^{18}O$) and radiometric strontium ($87Sr/86Sr$) and lead ($20nPb/204Pb$) ratios for the Tula Grande region. These baseline values were then compared to human $\delta^{18}O$, $87Sr/86Sr$, and $20nPb/204Pb$ values, derived from the analysis of tooth enamel, to identify individuals who may have migrated to the Tula Valley during the Epiclassic. For all individuals included in this study, bioarchaeological, mortuary, AMS radiocarbon dating and stable carbon ($\delta^{13}C$) and nitrogen ($\delta^{15}N$) data previously assayed are included to contextualize these new data. These new mobility data, in conjunction with previous results, will provide further insight into the population patterns of the pre-Toltec Tula Valley.

[202] *Digging the Anacostia River Landscape: Geoarchaeology and the Buried Past in the National Capital*

The historic Anacostia River valley was a focal point for settlement by local Native American populations as well as European Colonial and post-Colonial populations. However, the valley floor had low-topographic relief, large marshes, and soils prone to erosion, leading to many grand efforts of dredging and land reclamation. Flooding led to further raising of the landscape in the early 20th century, and to the deeper burial of archaeological sites. Fortunately, the Anacostia River valley was well-mapped in the 19th and 20th centuries, and 3D approaches to landscape visualization have recently allowed archaeologists to model the historic valley in the last half of the nineteenth century. Models of fill thickness have been generated and tested through geoarchaeological borings and trenches. While the effort is piecemeal and being refined, the landscape approach with GIS modeling has yielded encouraging results.

Katz, Jared (University of California, Riverside)

[118] *The Numerous Faces and Voices of Ancient Maya Instruments: A Typological Analysis of Ancient Maya Musical Artifacts Based on Physical and Tonal Attributes*

Over the past several years, the Maya Music Project has documented over 430 ancient Maya musical instruments. In addition to photographing all of the instruments, over 160 musical artifacts have been 3D scanned, and audio recordings were made of many of the artifacts. This paper will focus on the typological analysis of instruments based not only on their stylistic and technological attributes, but also on the tones the instruments are able to produce, as it is clear the artisans who created these instruments had a solid understanding of the manipulation of pitches. In particular, this paper will analyze several types of instruments, including specific categories of ocarinas, globular flutes, and rattles. Certain types of instruments were made more frequently than others, and this research attempts to understand the cultural significance of these categories of artifacts. This paper will also describe the use of digital experimental archaeology as a useful tool when attempting to understand the internal structure of instruments, as numerous instruments have been recreated digitally, and then 3D printed. The playable 3D prints sound very similar to the original artifacts, demonstrating the success of this experimental approach.

[23] *Migration, Monuments, and Memory in Fifth-Century Britain*

The fifth century in Britain is one of dramatic cultural, social, and economic change, transforming the late-Roman communal landscape into one dominated by Anglo-Saxon kingdoms. These changes have often been attributed to the collapse of the Roman Empire or the arrival of immigrants from the continent. This paper uses ArcGIS, isotopic studies, and multivariate statistics to investigate the relationship between where people came from, where they chose to bury their dead, and what they sent with them. My preliminary analysis of data from more than 9,000 burials in over 100 cemetery

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

populations indicates that changes in burial practices were the result of a larger shift from a society based upon Britain's relationship with the Roman Empire to one based upon its local communities, whether composed of natives, or newcomers, or both. No matter where people came from, no two communities reacted to the upheaval of the fifth century in the same way, and there were no monolithic or universal ways of relating the past to the present and future. New practices appeared, and old practices continued, some of which were better suited to some fifth-century inhabitants of Britain than others.

Kay, Marvin (University of Arkansas)

[122] *Ashes to Ashes, Dust to Dust in Caddoan Mortuary Ritual*

Sediment of varied textures and colors, ash among them, is highlighted from deliberately burnt Harlan-style charnel houses. These were erected in sub-mound pits. In one rendition that followed an earlier house burning, light gray ash alternates in the superior, or upward, position with the black charcoal layer of a collapsed burnt thatch and cane roof. The ash was levelled as a platform. This completed a mortuary cycle linked lineally to subsequent pyramidal mound construction. In other cases this dichotomy is retained as small marker mounds of dense black clay beneath light gray ash, as charnel pits and prepared flattop mound surfaces. Fire smoke and ash likely signified the passage of souls to the upper world, of life resurrected from death; whereas the black under layer was a metaphor of death.

Kaya, Deniz (University of Notre Dame)

[29] *Burning the House: The Importance of Excavation Methods in the Study of Space and Place in the Neolithic Household. A Case Study from Neolithic Bulgaria (6500–600 BC)*

The importance of understanding the use of space and the distribution of places in the household in the prehistoric setting has been recognized by the anthropological community. Unfortunately the archaeological context often does not always favor such inquiries, especially in the prehistoric setting. Thus, the extraction of information needed to make claims on how different societies distributed living areas in the house and in the greater village, cannot always be examined in detail. For the purpose of this paper, I will examine how the sites of the Early Neolithic (6500–6000 BC) villages of sites such as Slatina and Mursalevo in Bulgaria can contribute greatly to these questions. The ritual burning of the houses from these communities, and the particularities the excavation of these houses require can contribute greatly to how archaeologists approach the first step of data collecting: excavating. I will argue that the particularities in excavation methodology are the most important step in understanding what the house was like and what role it had in prehistoric people's lives.

[37] *Chemical Composition of Maya Slips: Analysis and Interpretation of Preclassic Sherds from Holtun, Guatemala Using pXRF Technology*

Slip, a fluid suspension of clay that is applied to the surface of a piece of ceramic, allows for increased control over the functional and aesthetic properties of the finished vessel. The potter can select a slip to provide a more appealing color, texture, and/or luster to the vessel's surface, while maintaining the favorable functional qualities of the paste. While slip color has long been used as an attribute for classification in the Maya lowlands, only recently have the raw materials of slips been used to inform studies of production and exchange, with much of this work using Late and Terminal Classic period ceramics. This paper presents the results of portable x-ray fluorescence (pXRF) analysis of the chemical composition of red, cream, and black slips on Preclassic ceramic sherds excavated in 2017 from Holtun, Guatemala. Variation, or lack thereof, in the chemical composition of the three colors of slip can suggest change in ceramic production, exchange, and differential access to pottery throughout the site. This research tests the utility of pXRF on slip and also informs models of Preclassic period ceramic production and exchange.

[8] *Archaeological Investigations of the Archaic and Paleoindian Occupations at Hall's Cave, Texas*

Hall's Cave is a well-studied paleontological site that has provided a detailed climatic record for the Texas Hill-country from the late Pleistocene through the Holocene. There have been no discussions, however, of the archaeological record of the cave deposits. Archaeological excavations at Hall's Cave conducted in 2017 revealed a 3 m thick, well-stratified sequence of sediments derived from the watershed outside the cave. Early deposits ranging from 18,000 to 14,000 cal yr B.P. contain the remains of horse, *Bison antiquus*, saber-toothed cat, and other species in well dated contexts. The archaeological record includes a burned rock midden, twenty hearths, projectile points, stone tools, and flakes that range from late Paleoindian to late Archaic. The hearths represent mostly short-term occupation episodes and the macrobotanical remains they contain provide a unique opportunity to understand diachronic subsistence and environmental changes for the region.

[204] *Mind the Gap: Laws and Policies Related to Burial Places in Pennsylvania*

Pennsylvania has a long history of human occupation and an array of community types and settlement patterns ranging from large cities to sparsely populated rural communities. This geographic and cultural diversity resulted in varying burial practices including small family plots in farm fields, religious burial grounds, as well as private and publicly-owned cemeteries. As the state grew and changed throughout the 19th and early 20th centuries, the legislature enacted or revised laws affecting burial places and human remains in a piecemeal fashion, likely in response to specific projects and circumstances. This legal framework has not been substantially changed since the mid-20th century, leaving policy gaps that recent projects have exposed. Chief among these issues is how privately-owned, unmarked burial places are treated legally and ethically when remains are discovered, often during development activity. This session will explain the legal and policy environment for burial places in Pennsylvania as context for the 218 Arch St. project in Philadelphia.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Kehoe, Alice**[42]** *The Postcolonial Imperative*

Formal dissolution of European empires following WW II, as they transformed into transnational financial powers, allowed subaltern standpoints and “traditional knowledge” (TEK) to be voiced. American archaeology shifted into CRM becoming the dominant field, reflecting in part the rise of tourism as a principal global industry, with local histories a selling tool. Then NAGPRA put American archaeology into a postcolonial position. While much of NAGPRA negotiations still falls into colonialist discourse, and paternalism still rules the BIA, a postcolonial standpoint is basic: there is no “prehistory,” every community has its history and archaeologists’ work must pay attention to those histories and knowledge—a rapprochement between Enlightenment universalist premises underlying “science,” and foundational premises held by non-Western nations. A postcolonial standpoint will conflict with academics’ high valuation of Theory, which in its universalist pretensions remains colonialist discourse. For some of us, “archaeologies of listening” describes our postcolonialist approach; working with ethnohistorians is an allied postcolonial approach. The ground is shifting, like tectonic plates uplifting ranges of TEK.

Kelleher, Deirdre (Temple University)**[296]** *Unearthing the Material Culture of Nineteenth-Century Irish Immigrants in the “City of Homes”: A Case Study from Elfreth’s Alley, Philadelphia, Pennsylvania*

In contrast to many other American cities, which developed distinctive ethnic neighborhoods during the nineteenth century, Philadelphia’s European immigrant populations were largely dispersed throughout the city during this period. Irish immigrants lived in every ward of Philadelphia as newcomers from various European countries settled along alleyways and courtyards throughout the city. Using Elfreth’s Alley National Historic Landmark as a case study, this paper argues that the dispersion, intermingling, and lack of segregation between immigrant groups in Philadelphia had implications for how newcomers navigated daily life and how the material culture they left behind can be interpreted as representations of material identity. A diverse population of European immigrants shared living spaces along Elfreth’s Alley during the nineteenth century, including residents from Ireland, Germany, England, Spain, Russia, the Czech Republic, and more. Archaeological investigations at two properties along the Alley did not unearth artifacts discretely linked to “Irishness,” rather an examination of the material culture of the built environment revealed common features across domestic spaces shared by immigrants from different ethnic backgrounds. The findings at Elfreth’s Alley highlight some of the challenges and limitations of uncovering material demonstrations of ethnic identity in densely populated urban contexts.

Keller, Angela (Statistical Research, Inc.)**[129]** *The View from Below: Plaza Spaces at Actuncan, Belize*

Formal plazas constitute the majority of public space in Maya centers and yet, until quite recently, plazas have not received the same investigative attention as the impressive pyramids and palaces that surround them. This neglect is largely due to the difficulty of investigating public plazas, which typically contain few artifactual or structural indications of their ancient use. Although the identification of activity in ancient plazas is technically challenging, a dedicated investigation of plazas is nonetheless essential to our understanding of how centers functioned in Maya society. Public plazas were the venues for the bulk of a center’s daily activities from ritual, dance, and sacrifice, to market trade and the settling of disputes. This paper presents the results of two seasons of plaza-focused fieldwork at the site of Actuncan, Belize combining rapid systematic data collection, soil chemistry analysis, macro- and micro-artifact analysis, remote sensing, and targeted excavations. This research program has allowed us to detect subtle patterns that may reflect distinctive past practices in the plazas of Actuncan.

Keller, Hannah (University of Colorado, Denver) and Naomi E. Cleghorn (University of Texas at Arlington)**[99]** *The Fauna of KEH-1 (South Africa) A Middle and Later Stone Age Site: A Pilot Study*

Knysna Eastern Heads Cave 1 (KEH-1) demonstrates an intense occupation sequence at a site overlooking the now sub-merged Agulhas Bank during multiple ocean progressions and regressions in the late Middle Stone Age and early Later Stone Age (46,000 to 18,000 Cal BP). The site contains numerous hearth features, densely stacked within the stratigraphic section, and has yielded large amounts of fauna. Here we report for the first time on the preliminary taphonomic analysis of the fauna, based on a sample of 1,142 specimens recovered from all major stratigraphic units. Nearly all KEH-1 faunal specimens are fragmented. Thus, an initial analytical goal was to assess the nature of this fragmentation and determine the extent to which it reflects nutrient processing rather than post depositional damage. In addition, 326 faunal specimens were chosen from throughout the stratigraphic sequence to provide a preliminary assessment of size classes represented, processing intensity, and post-depositional alteration. Our results suggest that the high rate of fragmentation is due to human processing of a wide range of prey size classes. Continued analysis of the KEH-1 fauna has the potential to elucidate the subsistence strategies of foragers in an extinct ecosystem across a critical shift in stone tool technology.

Kellett, Lucas (University of Maine at Farmington)**[207]** *The Formation of Agro-pastoral Communities in the Chanka Heartland (Andahuaylas, Peru)*

This paper examines how Late Intermediate Period or Chanka phase (~AD 1000–1400) communities were formed during a period of overlapping social and environmental risks in the Chanka heartland of Andahuaylas. In particular, the paper considers how aggregated hilltop communities formed and functioned under new social and economic conditions. Recent archaeological research from Andahuaylas suggests that the majority of aggregated Chanka phase ridgetop sites were likely inhabited by neither specialized agriculturalists nor camelid pastoralists, but rather populations which identified as agro-pastoralists. The paper suggests that threats of attacks by neighboring populations and climate induced economic risk, may have tethered populations to smaller localized territories which encouraged more fluid socio-political-cultural identities. The author argues that hilltop communities in Andahuaylas may have witnessed a shift to a more integrated and inclusive socio-ethnic identity rooted in an agro-pastoral subsistence economy. Finally, this paper challenges an oversimplified dichotomy and social division among traditional Andean agriculturalists and pastoralists, and argues that conceptions of community and ayllu require a more nuanced and flexible understanding, especially during times of heightened risk.

[207] *Chair***Kelley, Alice R.****[135]** *Burning Libraries and Drowning Archives: Shell Middens on the Maine Coast*

Climate change impacts on archaeological sites are equated with the burning of the great library of Alexandria for the scale and rapidity of the loss of cultural and paleoenvironmental data (McGovern, 2016). A portion of that destruction is often in the form of sea-level rise exacerbated coastal erosion. While threatened historic sites, such as lighthouses, generate support for remediation and even relocation, coastal aboriginal sites holding records of thousands of years of coastal occupation and scientific data are damaged and disappear each year. In Maine, over 2,000 shell middens are located on the mainland and island coast. Virtually all are eroding, and some have disappeared in the decades since identification. This presentation is a progress report on our successful efforts to develop a technique to use Ground-Penetrating Radar (GPR) as a rapid, non-invasive method to delineate the areal

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

and vertical extent of Maine's eroding coastal shell middens to inform cultural management decisions. Additionally, we report on the early stages of building a citizen science network to undertake rescue excavations and monitor conditions and erosion rates at sites throughout the year.

[215] *Space and Place in Mississippian Societies; Lynne Goldstein's Impact on the Study of Aztalan and Cahokia Landscapes*

Lynne Goldstein's contribution to our understanding of Mississippian societies in the Midwest is still an ongoing endeavor. Her research with its roots in the greater Cahokia area and within a few years at Aztalan has an important impact on my own efforts. Her dissertation research into the Mississippian cemeteries, Schild and Moss, was methodologically rigorous and provided insights into the manner in which non-elite cemeteries some 100 km north of Cahokia were spatially and socially configured. While at the University of Wisconsin-Milwaukee Lynne began a systematic study of Aztalan and the broader landscape of the Crawfish river, one of the first efforts employing GIS in the Midwest. Her work within Aztalan examined numerous aspects relating to the site's spatial organization especially the details of a unique landscape configuration known as sculpturery. This presentation focuses not only on the context of these contributions but also the impact of her scholarship on my understanding of Cahokia's broader landscape.

[179] *Resurrectionists, Criminals, and the Unclaimed: Social Context of Cadavers in the 19th Century*

Cadavers have been used to study anatomy and practice anatomical dissection for over 2,000 years. For most of this time, the use of cadavers was neither ethical, nor legal. In U.S. medical study today, most cadavers come from body donation programs largely resulting from the Uniform Anatomical Gift Act (UAGA), first proposed in 1968. The UAGA followed a change in social context of cadavers. It introduced the body as property and provided individuals the right to donate their body following death. Before the mid-1900s, the lack of legal avenues for the acquisition of cadavers led to the 18th century practice of grave robbing. In the U.S., "Resurrectionists" exhumed and sold recently buried bodies to anatomists. To stop grave robbing, anatomy acts were introduced in the late 18th/early 19th century. Governed at the state level, these laws outlined which bodies could be obtained legally for use as cadavers. Most laws allowed the bodies of criminals, suicides, indigent, or unclaimed individuals to be used as cadavers. The Point San Jose collection offers an opportunity to understand the social context of anatomy laws during the 19th century and identify those people used in anatomical studies.

[211] *Plow Zone Archaeology in a Wari Imperial Center*

The immense size of most Wari Imperial administrative centers has limited the breadth of our understanding of the social, political, ritual and economic activities that may have occurred within these large rectilinear compounds. In order to address these limitations, the 2017 Nasca Headwaters Archaeological Project excavation season at Incawasi attempted to apply a more traditionally North American methodology to six 50x50 meter Wari patio groups in order to draw broad conclusions about the scope of activities at the site. A total of 457 shovel test pits were excavated in a 5x5 meter grid across the site. Incawasi has been heavily damaged by modern cultivation; however, experimental studies have shown that while plowing destroys the stratigraphy at a site the vertical and horizontal movement of artifacts is limited. The implications of this for Incawasi are that shovel test pits provide an ideal methodology to create large area, low-resolution data to understand the activities undertaken within these patio groups. This paper presents the spatial analysis of the finds from the 2017 season at Incawasi in order to highlight the functional use of space in a Wari administrative compound in the Upper Nasca River Valley.

Kennedy, Jennifer (Central Michigan University) and D. Andrew Merriwether (Binghamton University, SUNY)

[88] *Inferences about Class Structure from Burial Form and Mitochondrial DNA Relationships at Tall Šēḥ Ḥamad, Syria*

The Roman/Parthian period (200 BCE—300 CE) at the site of Tall Šēḥ Ḥamad, Syria existed during a period in the region characterized by political instability and military movement. This "borderland," existing at the extremities of both empires, created a unique sphere of potential interactions both on the individual level and broader scale. A cemetery from this period shows four distinct burial forms (mud-brick graves, earthen graves, amphora graves and clay sarcophagi). In an effort to better understand the site of Tall Šēḥ Ḥamad this study presents thirty nine molecular profiles of individuals from the Roman/Parthian period at Tall Šēḥ Ḥamad in conjunction with archaeological mortuary evidence to determine how individuals may be related to one another, how matrilineal relationships may relate to burial form as well as potential regional interactions. Genetic results indicate a relatively homogenous population with no evidence of a recent influx of new mitochondrial haplotypes during the period under consideration despite the political disruption in the region. Genetic distances between individuals in different burial forms, however, indicate a socio-economic distinction that influenced the ways in which related individuals were buried.

[240] *Life in a Colonial Mining Camp: Reconstructing Power and Identity in a Colonial Context (Puno, Peru)*

Mineral mining was a critical driver of the Peruvian economy during the early colonial period (AD 1550—1700). Peru's mineral wealth was used to fund the Spanish empire's geopolitical domination, often at the expense of indigenous Peruvians. Many were forced to labor in distant mines and work

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

camp, decimating local communities. The south-central highlands of Peru were an especially rich area for mineral exploitation and mines, work camps, and processing mills have been identified throughout the Northern Lake Titicaca Basin. Despite being a major center for colonial mining, no archaeological research to date has been conducted in the region. This poster presents preliminary mapping and surface survey data from multiple colonial silver processing sites (often called ingenios or trapiches) located 10 km southwest of Puno. These sites exhibit a variety of indigenous and Spanish architectural forms and spatial patterns. Spatial analysis techniques are applied to compare the spatial layout of domestic buildings, work zones, and communal areas at each site, noting differential levels of accessibility and visibility. Analysis reveals how social inequality, restricted and controlled access, and difficult living conditions were part of everyday social life for indigenous miners and laborers at these sites.

[306] *A Forensic investigation of the Ralph Glidden Human Remains Collection of the Catalina Island Museum*

Members of the Gabrielino/Tongva community always felt that the Ralph Glidden Collection within the Catalina Island museum required a forensic style of investigation. Although they may have been discussing the entire collection, it is definitely applies to the human remains collections. The Catalina Island Museum human remains collection that was recently repatriated had received limited analysis. A few scholars incorporated the collection into larger discussions about the Gabrielino and Chumash cultural communities. Decker (1970) and Wlodarski (1978), summarized aspects of Glidden's collection, but an update regarding the overall understanding about the people represented in the collection are long overdue. Many assumptions have been made about what cultures are represented in the overall Catalina Island Museum human remains Collection. This poster is an opportunity to provide a comprehensive biological profile and a comprehensive osteological analysis of the people that Ralph Glidden and others excavated, that was performed during NAGPRA and in collaborative efforts with tribal communities.

[138] *Curatorial Cures: Storage, Partage, and the Colonial*

The crisis in the curation of materials generated as a result of excavation and survey is one of the most pressing issues facing the discipline. Storage is of constant concern as questions of how to store materials, where to store materials, and how long to store these items confront archaeologists and license/permit-granting agencies around the globe. This is an examination of an innovative approach to solving the curation crisis of Early Bronze Age ceramic vessels from the Dead Sea Plain in Jordan. After the untimely death of the excavator, thousands of pots excavated at Bab adh-Dhra' in the 1960s remained in museum storerooms, unstudied, unviewed, and unloved. Archival, collections-based, and ethnographic research revealed a scheme (devised by the Jordanian Government and representatives of the American Schools of Oriental Research [ASOR]—the excavation sponsors) to distribute the tomb groups to ASOR member institutions. Twenty-four educational institutions throughout Australia, Canada, and the United States received tomb groups for research, study, and display. This creative solution to the burgeoning storage problem in Jordan resulted in the curation of threatened collections, educational access and display of archaeological material, and "artifacts acting as ambassadors on behalf of Jordan".

[307] *The Development of Hydroelectric Power over Ancestral Land in Chilean Patagonia*

Chile is largely reliant on fossil fuels for energy and is working to transition to more renewable energy sources, specifically hydroelectric power. As part of this initiative, the state is proposing the construction of five hydropower dams in southern Chile. In this paper, we analyze the potential impact of this project on the ancestral land of the Mapuche. The Mapuche have been resisting the modern Chilean state's approach to water and power and are fighting for land rights and the preservation of their culture and archaeological history. Using geographic information systems analyses we identify which areas of ancestral lands would be flooded, including threatened archaeological and historical sites. We frame the conflict between the modern state and the Mapuche with personal interviews and literature analysis.

[325] *Carbon Legacies of Dryland Agricultural Features in the Ancient Southwest*

This paper presents the results of a meta-analysis of soil organic carbon measurements associated with pre-Columbian dryland agricultural fields in the southwestern U.S. and northwestern Mexico. In aggregate, rock alignments and terraces are associated with significantly higher organic carbon concentrations, and this effect is pronounced in sandy parent material. The results support a hypothesis that resource conserving features constructed by indigenous farmers continue to influence the ecology of drylands by enhancing plant productivity in the most water limited settings.

Khalaf, Nadia (University of Exeter, UK)

[210] *Archaeological Survey and Geographical Information Systems (GIS) in African Archaeology: Perspectives from the Niger Valley, Benin*

The Niger River Valley in the north of the Republic of Benin, West Africa, has abundant archaeology that until recently has been under researched. During a systematic field survey carried out for my doctoral research as part of the European Research Council-funded Crossroads of Empires project led by Prof Anne Haour, over 300 new archaeological sites were discovered and 50,000 material culture objects recorded. This paper will discuss the methodology used to systematically survey the landscape of this region using field walking and satellite imagery and how the results were integrated within a GIS, creating the most archaeologically comprehensive map of the area ever made. The preliminary results of this research demonstrate that settlement favoured areas close to perennial and ephemeral fluvial systems. Furthermore, the spatial distribution of the sites discovered displayed strong evidence of spatial clustering, which has been shown in other West African contexts to be indicative of early urbanisation—however this may also be evidence of the slow destruction and segmentation of mounded sites.

Khalsa, Sant Mukh (CUNY Graduate Center)

[167] *Of Fish and Plague: Death as Economic Opportunity at the Medieval Fishing Station of Gufuskálar, Iceland*

The high morbidity (50% or greater) of Iceland's Black Death in 1404 C.E. disrupted a rigidly hierarchical Icelandic social order and led to an inability to enforce social and legal constraints on Iceland's labor classes. This newly untethered and mobile lower class searched for avenues for wealth creation previously unavailable. One avenue, in the century following Iceland's Black Death, was through fishing and fish exports. During this period, previously tightly restricted fish exports flourished in trade between European merchants and numerous fishing and trading sites around Iceland's coast. The 15th

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

century fishing station of Gufuskálar on the northern coast of Iceland's Snæfellsnes peninsula demonstrates large and anomalous concentrations of wealth and European trade goods. The site also has evidence of increasingly specialized marine resource utilization. Whether Gufuskálar's resident fishermen were Icelandic or European, it is likely that this concentration of wealth was only possible through the temporary breakdown in Icelandic social hierarchy. Based on the zooarchaeological and preliminary artifactual data, this paper explores how social upheaval following Iceland's Black Death is connected to intensive preindustrial fishing and a late medieval European dependence on Icelandic marine resources.

Khatchadourian, Lori (Cornell University)**[181] Soviet Materiality and Its Ruins**

To borrow Yuri Slezkine's formulation, "the Soviet Union was an empire—in the sense of being very big, bad, asymmetrical, hierarchical, heterogeneous, and doomed". In this it differed little from the early empires that have long held archaeology's attention. But unlike its precursors, the U.S.S.R. was guided by a political ideology premised vigorously on the relationship between humans and things—between labor, the non-human inputs of production, and property. Imperial sovereignty rested on profound material dependencies that stitched the multiethnic "federation" together, while the individual Soviet subject was forged out of the proverbial hammer and sickle. As with all empires, the promised utopia never arrived, and the Marxist-Leninist "mattering" of politics came at a terrible human and environmental cost. The doom of this bold endeavor is palpable today in the physical ruins of Soviet socialism, which haunt the archaeological record of the contemporary past across Eurasia. Based on preliminary survey, ethnography, and archival research, this paper represents a foray into Soviet materiality and its afterlife, taking as its touchstone the former Soviet republic of Armenia and the industrial ruins that litter its urban and rural landscapes. What is to be done with imperial debris?

Kidder, Barry (University of Kentucky), Jacob Welch (Yale University), Scott Hutson (University of Kentucky) and Shannon Plank (University of Kentucky)**[162] *Us and Them: Regional Integration and Social Differentiation during the Terminal Preclassic at Ucanha, Yucatán, Mexico***

Often overshadowed by the splendor of massive monumentality to the south, Late Preclassic life in the Northern Maya Lowlands is a period of material and social experimentation, a balancing act between emerging social differentiation and an ideology of communal integration. During the latter half of this period, the secondary site of Ucanha in Yucatán was physically integrated into a micropolis via an 18-km long sacbe and experienced the creation of integrative civic spaces, a population apogee, and an influx of ceramic heterogeneity. Unlike the more rigid and historically ingrained materialization of social differentiation seen in the Late Classic, the material components of distinction during this time were more fluid, in general, and more ambiguous during and after this process of larger regional integration. The presence of possible extrahousehold feasting at a relatively isolated, larger domestic platform, an elite residence covered in stucco with iconography indicating governance and/or economic distinction, and various ceramic forms and aesthetic embellishments highlight emerging new materialities of differentiation. With an apparent depopulation by the Early Classic, it is likely these new expressions favored social inequality over communal cohesion.

Kidder, Tristram (Washington University) and Yijie Zhuang (Institute of Archaeology, University College, London)**[161] *The Tangled Roots of the Anthropocene: China from the Late Neolithic to the Song Dynasty***

The Anthropocene is now commonly defined as a geological event, or "golden spike" that begins in the later twentieth century with the detonation of nuclear weapons. While this event-based characterization serves a useful purpose in providing a formal geological definition, it tells us nothing of how humans developed the social, economic, technological, and moral capacities that allow us to affect natural processes at a global scale. Using archaeological and environmental data from China between the late Neolithic (ca. 5000 years ago) and the Song Dynasty (ca. 1000 years ago) we explore how the Anthropocene can be conceived as a process that developed slowly over time and that was conditioned by changing human interactions with the environment that were an outgrowth of shifting social, political and even religious practices and behaviors. This approach emphasizes that the Anthropocene is not the inevitable outcome of human technological progress but is, instead, the result of long-term transformations of human engagements with power, wealth and production.

Kieffer, C. L. (Museum of Indian Arts and Culture, University of New Mexico)**[267] *Exploring the Use of Multispectral Imaging in Ceramic Pigment Analysis***

Multispectral imaging cameras are frequently used in art conservation for identifying pigments as well as monitoring change in pigments over time. Multispectral cameras take multiple images at 370nm, 448nm, 476nm, 499nm, 519nm, 598nm, 636nm, 700nm, 735nm, 780nm, 870, and 940nm wavelengths with UV bandpass, visible bandpass, and long pass filters to increase the range of captured information to include UV reflectance and fluorescence emission images. This poster explores the ability to utilize this non-destructive technique to analyze variability of pigment recipes within ceramic types and between types. Mineral and organic black pigments from five Black-on-white ceramic types (Jemez, Cortex, Chuska, Red Mesa, and Abiquiu) from the American Southwest were used for comparative purposes. Pigment and reflectance values acquired from images via Image J software were compared both within types and between types with one-way ANOVA analysis. Results show varying levels of significant statistical difference between types and minimal difference within types.

Kienon-Kabore, Timpoko Hélène (University of Félix Houphouët-Boigny of Cocody) and Vincent Serneels (University of Fribourg)**[32] *La Métallurgie Ancienne du Fer de la Zone 4000 de Siola (Kaniasso, Zone d'Odiénne, Nord-ouest de la Côte D'Ivoire)***

Près de Kaniasso dans la zone d'Odiénne, sur les sites de Siola, zones 1000 et 2000, et Doumbala, une séquence chrono-technologique en trois phases a été mise en évidence, caractérisées par trois traditions techniques différentes: KAN 1 (1300—1450 AD), KAN 2 (1450—1650 AD) et KAN 3 (1650—1900 AD). Des vestiges présentant de grandes similitudes ont été identifiés sur de nombreux sites dans la région.

Par contre, le site de la zone 4000 de Siola, dont l'étude sur le terrain a été reprise en 2015, présente un faciès complètement différent, la tradition technique KAN 4. Le site occupe une superficie de l'ordre de 2 km² et comporte environ 200 amas de scories, des enclos et des murets. On note aussi la présence d'un abondant mobilier domestique. L'organisation spatiale des amas de scories, l'architecture des fourneaux en fosse complètement ensevelis sous terre et la nature des déchets métallurgiques, se distinguent clairement des vestiges reconnus ailleurs. Les tuyères présentent de curieuses perforations latérales, une particularité inconnue par ailleurs.

[127] *New Investigations at Bonfire Shelter: A Consideration of Bison Jumps and Their Implications for Paleoindian Social Organization*
Bonfire Shelter (41VV218) is a nationally significant site in the Lower Pecos region of the West Texas borderlands that preserves evidence of what may be the oldest and southernmost "bison jump" in North America. At least two major episodes of bison hunting are evident at Bonfire Shelter, one associated with Paleoindian Plainview and Folsom projectile points, and another associated with Late Archaic Castroville and Montell points. The approximately 12,000-year-old layers comprising Bonebed 2 appear to represent a singular example of this hunting technique in these early time periods, and are the subject of recent debate. There is disagreement as to whether one or as many as three hunting events are represented in Bonebed 2, and as to whether or not they truly represent bison jumps. This paper reports the results of renewed field investigations into the timing, context, and cultural associations of both bone beds at Bonfire Shelter carried out by the Ancient Southwest Texas Project at Texas State University.

The paper then considers the interpretation of these archaeofaunal deposits as bison jumps, and the implications of those interpretations for Late Pleistocene hunter-gatherer social organization in the Lower Pecos and the larger Southern Plains region.

Kilgore, Gertrude (Texas Tech University), Claire Novotny (Kenyon College) and Alyssa Farmer (University of Kentucky)

[157] *Domestic Activity Areas in a Late Classic Residential Courtyard Group at Chan Chich, Belize*
Households represent a foundational element of any society. The everyday activities that occur within domestic spaces construct and reinforce the social, economic, and political framework upon which societies are built. The 2017 field season of the Chan Chich Archaeological Project saw the first explicit study of domesticity and everyday life at the ancient Maya site of Chan Chich with investigations of final phase domestic activity areas in Courtyard D-4. This Late Classic residential group consisted of three structures centered around a shared courtyard space approximately 550 m east of the Main Plaza. We analyzed the use of structural, courtyard, and extramural spaces by using multiple lines of evidence from multi-elemental analysis of plaster samples and artifactual and architectural data. Analyzing these categories of evidence associated with three different contexts allowed us to reconstruct domestic activity areas at different phases of everyday life: the production, consumption, and disposal of household objects. This research contributes some of the first information about the functional and sociocultural relationship between domestic spaces, activities, and individuals at Chan Chich.

[254] *Gardens, Infields and Outfields: Cultivation Intensity, Neotropical Landscapes and the Evolution of Early Agricultural Systems*
Plant cultivation in and around residential locations and at greater distances from settlements are options early cultivators employed, supplemented by wild resources, to meet subsistence needs. The mix of plants, soils and cultivation practices varied by environment, distribution of resources, population density and other factors. This paper examines the role of gardens over the long transition from hunting and gathering to agriculture in tropical lowland environments. Ethnographic data, derived from a sample of neotropical contexts, are used to evaluate some of the earliest evidence (micro- and macrobotanical, isotopic and archaeological) for maize and other crops in lowland Mesoamerica.

[132] *A Colonial Space in the Camata-Carijana Valley: A Review of the Tambo, Maukallajta*
The Camata-Carijana Valley is situated on the eastern frontier of the Inka Empire in the Kallawayaya domain. Ethnohistorical accounts state the valley was occupied by the Kallawayaya and Chuncho groups from the tropical piedmont (Saignes 1984, 1985; Steward 1948). Therefore, the Camata-Carijana Valley offers the opportunity to study Inka, Kallawayaya, and Chuncho entanglements through time. This paper focuses on the site of, Maukallajta, in the Camata-Carijana Valley. Also known as Pueblo Viejo, Maukallajta was an Inka tambo. It was likely established to promote trade with other groups (Alconini 2012; Capriles Flores and Herrero 2006). More specifically, the research explores how the impact of Inka imperialism affected the architectural patterns of Maukallajta. Therefore, the location, organization, and architecture of Maukallajta will be analyzed to understand its nature and purpose (Moore 1992, 2011; Pozorski and Moore 1997). Terraces and roads associated with the site will also be examined. Maukallajta is just one colonial space in the Camata-Carijana landscape in eastern Bolivia. Other settlements, pre-Hispanic roads, and agrarian terraces are discussed to provide a regional perspective and to explore the relative impact of Inka imperial processes in the Camata-Carijana Valley.

[56] *Harappan Necropolis of Rakhigarhi, India: Archaeology and Bioanthropology*
The number of Harappan cemeteries so far systematically surveyed is far less than that of contemporary settlements. Necropolis site at Rakhigarhi (India) was reported earlier but in small scale investigation. Our investigation for the last three seasons (2013 to 2016) was thus designed for improving this lacuna. We first classified each burial and analyzed statistically. The Harappan people practiced rather humble burial custom, but few were found differently and these burials look more socio-economically affordable than those found in typical burials. The health condition during life-time of the buried looks healthy according to bioanthropological investigation. Prone positioned burial is interesting since it was not as deviant cases. Rather, they would have held relatively higher social and ritual position in Rakhigarhi society according to anthropological and archaeological context. Collaborative work was designed for better investigation on the Harappan people's life and mortuary customs. We applied to systematic osteoarchaeological field methods, bioanthropological lab-analysis and other innovative methods. This research was supported by Basic Science Research Program through the National Research Foundation of Korea (NRF) funded by the Ministry of Education (2017R1D1A1B03030127) and National Geographic Foundation for Science and Exploration—Asia (Asia-21–15). [256] *Tripping through the Underworld: Exploring Maya Ritual through Absorbed Residues in the Belize Valley*

While absorbed residues are widely used to explore subsistence-related questions, more recent work has used them to examine the use of elite and ritual beverages. In this paper, we explore absorbed residues found in ceramic containers and bone tubes recovered from caves, burials, and caches in the Belize Valley. The ceramic vessels presumably held liquids consumed or otherwise used in rituals in these settings, while the bone tubes delivered substances to participants in those rituals as enemas. Results of our analyses shed light on the kinds of substances used by the Classic Maya in their rituals associated with the underworld.

[331] *Living History in the Classroom: An Assessment of an Alternative Teaching Program*

This project was an assessment of the "Pioneers in Texas" structured historical program aimed at evaluating the effects of a Living History program on the participating students in an effort to expand the use of Living History pedagogy in standard curriculum. The program is conducted at the 1830s Jones Stock Farm at the George Ranch Historical Park (Park) in Richmond, Texas. The activity consists of lecture and participatory activities in the pioneer life experienced by one family of Austin's Old Three Hundred. The Park was interested in expanding an existing teacher-fed assessment to include students and their experiences; including, how the students recognized the Jones family as a real family, and not a historical construct. The Park wanted to assess how the program was effective in conveying history from the perspective of the Jones family and how this impacted the students. This assessment was completed collectively through a pre-project participation, observation, and group interviews.

[87] *Interpreting Increments—What Can Isotopic Evidence Tell Us about Care in the Past?*

Maternal and infant care practices are deeply individual, as well as being affected by both cultural and environmental factors. Disentangling the various processes which lead to decision-making in the past is difficult, and bioarchaeologists must use multiple lines of evidence to begin to understand behaviours. New incremental isotopic techniques mean that it is now possible to look at individual maternal and infant experiences through tissue chemistry. However, incremental isotopic results are equifinal meaning that multiple interpretations of the data are often possible. This talk will focus on a group (n=5) of incremental isotopic profiles from infants and children from the Inka period site of Camarones 9 in northern Chile. Using these profiles, we will explore how knowledge of the archaeological context, biological factors which may affect isotopic values and consideration of sociocultural theory may allow better interpretation of results. In doing so, we highlight the different maternal and infant experiences seen in individuals from the same archaeological period, and the importance of the individual in archaeology.

[138] *Wonderful Things: Using Legacy Archaeological Collections for Research*

How does one go about using legacy archaeological collections—or any archaeological collection, for that matter—for research? The prospect can be daunting, especially if you are staring down dozens of dusty boxes on shelves. This paper offers direction for studying even the most untamed collection by understanding it as a type of secondary data—lessons learned while working with legacy collections from the Potomac and Rappahannock river valleys in Maryland and Virginia. Secondary data, a term that crosses disciplines, is, in the broadest sense, data collected by someone else and used to address new or different questions than those originally posed. Defining research questions, becoming familiar with a collection, creating checklists, reconstructing provenience, developing methods for sorting, coding, and re-coding collections data, and applying appropriate quantitative techniques are steps we identified and found useful for the study of older collections, some generated nearly 80 years ago.

King, Robert (Bureau of Land Management)

[261] *Implementing NAGPRA: A Look at BLM's Experiences in Alaska, 1990–2017*

The 1990 passage of the Native American Graves Protection and Repatriation Act (NAGPRA) resulted in new responsibilities and challenges for the Bureau of Land Management (BLM). These included working with museums and tribes concerning certain items in museums removed from federal land sometimes more than a century earlier. The BLM in Alaska has been actively involved with NAGPRA work since the early 1990s, and has completed numerous Federal Register Notices and repatriations with more in progress. This paper briefly looks at some of the unexpected issues and situations that have occurred over the years along with many successes.

King, Stacie (Indiana University)

[275] *Cultural Pluralism and Persistence in the Colonial Sierra Sur of Oaxaca, Mexico: Three Case Studies*

This paper explores the interactions between multiple groups of people in the Sierra Sur region of Nejapa and Tavela, Oaxaca in trans-conquest and Colonial Mexico. Bringing together ethnohistoric accounts, oral histories, and archaeological data in Nejapa and Tavela, I highlight three case studies to show that migration, conquest, and interregional trade created a complex, dynamic, pluralistic ethnic landscape prior to the arrival of the Spanish. As such, when the Spanish colonial regime took hold in the Sierra Sur, people in Nejapa and Tavela were already accustomed to making strategic choices about how to engage. Some distanced themselves from migrants, merchants, and militaries, while others embraced new opportunities for trade and exchange. Some used the Spanish legal system to protect or solidify their social and political standing, while others persisted in maintaining subversive and secret indigenous religious practices and spaces. Enslaved Africans, government officials, priests, and residents of various castas likewise struggled to find their places. Understanding the dynamics of the pluralistic cultural landscape of Colonial Nejapa requires bringing together various threads of evidence and accepting that identities in Nejapa were, and always had been, multiple, changing, and global, across time and space, before, during, and after Spanish colonialism.

[33] *Evidence of Meteor Shower Outbursts Recorded in the Classic Maya Hieroglyphic Script Using Orbital Integrations*

No firm evidence has existed that the ancient Maya civilization recorded specific occurrences of meteor showers or outbursts in the corpus of Maya hieroglyphic inscriptions. In fact, there has been no evidence of any prehispanic civilization in the Western Hemisphere recording any observations of any meteor showers on any specific dates. The authors numerically integrated meteoroid-sized particles released by Comet Halley as early as 1404 BC to identify years within the Maya Classic Period, AD 250–909, when Eta Aquariid outbursts might have occurred. Outbursts determined by computer model were then compared to specific events in the Maya record to see if any correlation existed between the date of the event and the date of the outburst. The model was validated by successfully explaining several outbursts around the same epoch in the Chinese record. Some outbursts likely observed by the Maya were due to recent revolutions of Comet Halley, within a few centuries, and some to resonant behavior in older Halley trails, of the order of a thousand years. Resonant behavior from both Jupiter and Saturn controlled dynamical evolution of meteoroids in apparently observed outbursts.

Kintigh, Keith (Arizona State University) and Jeffrey Altschul (Statistical Research, Inc.; SRI Foundation)

[247] *Convergence Research and the Coalition for Archaeological Synthesis*

Archaeological forays into the climate change debate have generally been through case studies that integrate archaeological, anthropological, and paleoenvironmental data into coherent, evidence-based narratives that document how cultural systems in a relatively small geographic region adapted to long-term climatic change. While these cautionary tales can play a valuable role in galvanizing public opinion, they generally have not influenced public policy. What is lacking are scalable inferences relating long-term cultural resilience and sustainability to social configurations and strategies for addressing environmental dynamics. Achieving these inferences demands that we move beyond case studies and leverage the vast amount of archaeological data captured in heritage studies in what the National Science Foundation has characterized as convergence research, “the deep integration of knowledge, techniques, and expertise from multiple fields to form new and expanded frameworks for addressing scientific and societal challenges and opportunities.” The Coalition for Archaeological Synthesis was formed to foster and support precisely this type of collaborative synthetic research. This paper describes how, through such research, the Coalition has the potential to transform archaeological practice and to allow our results to be incorporated in public debates and policy initiatives on subjects such as climate change.

[23] *A Mosque and a Castle: The Discovery of the Salemi Mosque*

In the summer of 2007 an elaborate, colonnaded gypsum-plaster floor was discovered outside of the Salemi Castle in western Sicily. Believed to date sometime between the 10th and 12th centuries, this feature was constructed during a period when the island of Sicily was repeatedly invaded and conquered by a series of expanding political entities. As such, interpretation of this feature has proved to be somewhat difficult. However, its orientation in an eastward direction may suggest that this structure was used as a mosque, possibly associated with an Islamic hilltop fortification similar to the hisn of medieval Iberia. In this presentation, we discuss both architectural and spatial evidence that suggests this find is comparable to other identified mosques found around the Mediterranean, and particularly those found across Sicily.

[163] *Outside Looking In: The Piedras Negras Near Periphery Re-examined*

Surveys in 1997 and 1998 recorded 89 Classic Maya sites with 254 structures in the near periphery of Piedras Negras, Guatemala. Twenty-five sites were test pitted and five were intensively excavated. Recent re-analysis of the ceramic, lithic and architectural data from these sites provides new insights into how the Late Classic Maya (A.D. 625–825) in the near periphery participated in the Piedras Negras kingdom. Population size and implications for conflict are considered. Comparison of material evidence from the center with the near periphery sites suggests how identity and agency might have been negotiated at Piedras Negras during its most volatile and dynamic period of growth, warfare and collapse.

[168] *Connecting Project Archaeology and Girl Scouts Camps for Community-Based Learning Experiences at Ancestral Puebloan Sites in Utah*
Project Archaeology is an educational organization dedicated to teaching scientific and historical inquiry, cultural understanding, and the importance of protecting our nation's rich cultural resources. It is a network that makes archaeology education accessible to students and teachers nationwide through high-quality educational materials and professional development. Built on the Understanding by Design curriculum model, Project Archaeology: Investigating Shelter is a complete archaeological investigation curriculum and is endorsed by the National Council for the Social Studies. In recent years, this curriculum has been adapted to use in informal settings, such as Girl Scouts camps. Scouts had the opportunity to learn about the past through visiting Ancestral Puebloan sites and engaging with Elders from the White Mesa Ute Tribe and the Navajo Nation. Based on mini-assessments and verbal feedback, these experiential learning opportunities coupled with a powerful curriculum have been life changing for many. However, to more clearly show that our efforts have made a difference, Pre- and Post- assessments will be implemented to obtain quantitative and qualitative data that will improve programming and ensure that enduring understanding is taking place.

[329] *Can We Talk about Modern Human Behavior in non-Homo sapiens?*

Discerning what makes *Homo sapiens* distinctive among the rest of the species on the planet has been a difficult task. One suggestion has been our use of symbolic culture, the use and transmission of symbols intergenerationally. There is much discussion, however, about who the first ‘symbol users’

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

were, partly due to debates as to what actually makes something 'symbolic.' In this paper, I discuss how anthropologists first came to use symbol as the sine qua non of modern human behavior. Then, using archaeological and fossil data from the Old World, I show that many of the behaviors that are often suggested to be the sole purview of *Homo sapiens* have their genesis in the more remote past. Drawing from semiotic theory and the extended evolutionary synthesis, I argue that applying a more integrative theoretical framework can allow paleoanthropologists to discuss the behavior of our hominin ancestors without assuming too much or too little about their 'humanness.'

[143] *The Search to Resurrect Muslin Cotton in Bangladesh*

Bengal cotton muslin, a particularly fine type of woven cotton fabric, had legendary status where it was traditionally produced in East Bengal—now Bangladesh—for at least 2000 years. During the colonial influence of the British Empire, muslin was widely traded outside of South Asia, and became a valuable global commodity with major impacts on both local producers and foreign markets. Political turmoil and market forces, especially pressure from the East India Company, completely halted muslin manufacture in the early 20th century. As a result, "Phuti Karpas"—the variety of cotton required for its production owing to particular fiber characteristics, botanically *Gossypium arboreum* var. *neglecta*—was entirely lost. An extensive search was undertaken to locate any living example of *neglecta* in crop fields or in the wild, and a candidate wild population was identified. With only 100–250 year old herbarium specimens available for comparative materials, we use whole genome sequencing of modern and herbarium specimens to suggest that a wild-type Phuti Karpas has indeed been rediscovered. We describe molecular and morphometric results, as well as ongoing efforts to cultivate *neglecta* and revive traditional practices for muslin weaving.

[77] *Paleoindian Archaeology in the Munsungun Lake Region: Beyond Norway Bluff*

In the late seventies and early eighties Robson Bonnicksen identified and tested several fluted point occupation loci adjacent to chert deposits on Norway Bluff, Piscataquis County, Maine. Since that time various research projects have demonstrated the importance of chert from this region to the lithic economy of fluted point groups in northeastern North America. Despite these new insights little archaeological research has taken place in the Munsungun Lake region since Bonnicksen's original study. Here we present the results of our fieldwork from the summers of 2016 and 2017 that revealed the presence of additional lithic quarries in this location, as well as several potential fluted point sites associated with these newly identified quarry outcrops. These finds further demonstrate the importance of chert from the Munsungun Lake formation to the lithic economy of prehistoric groups in the region.

[141] *Making and Moving Pottery in the Northern Lake Titicaca Basin, Peru*

Pukara, in the northern Lake Titicaca Basin, was a regional center during the Late Formative Period (200 BC- AD 200). The Classic Pukara style is associated with monumental public constructions and sunken temples, elaborate stone sculpture, and a unique polychrome pottery tradition. Spotted felines, disembodied heads, camelids and plants, and anthropomorphic figures were incised and painted on incense burners, trumpets, and other special purpose ceramic vessels that were circulated in the Titicaca Basin and to neighboring regions. While there is limited direct evidence of ceramic production at Pukara, previous researchers have inferred centralized fineware production based on standardization measures such as size, shape, paste, and surface finish recorded from various collections. To further explore the nature of crafting practices during the Late Formative at Pukara, compositional analysis using LA-ICP-MS was recently completed of 150 samples, including clays collected near Pucará town and archaeological ceramics excavated from Pukara. We present the results of these analyses, which are used to address functional, chronological, and spatial variability in the production, circulation and consumption of Pukara utilitarian and ritual vessels during the Late Formative period.

Klassen, Sarah (Arizona State University)

[175] *The Adaptive Capacity of the Water Management System of Angkor, Cambodia*

This paper assesses the relationship between elements of adaptive capacity of a water management system among six time periods. The archaeological case study, Angkor, Cambodia, was the center of the Khmer Empire for over 600 years (9th-15th centuries CE). During this time, the Khmers developed one of the largest and most complex water management systems in the pre-industrial world. In this paper, I use geographic information system analyses to quantitatively and qualitatively assess six elements of adaptive capacity (the amount of water harnessed by the system, investments in infrastructure, human capital, redundancy, equal distribution of resources, and innovation) for six time periods. The relationships and trade-offs among the six elements shed light on agricultural production at Angkor as well as general theory on what elements contribute to the resilience of water management systems.

[117] *Alterity, Resistance, and Autonomy: Mortuary Archaeology and the Diversity of Indigenous Responses to Spanish Conquest in Lambayeque, Peru*

Over the last few decades, archaeological narratives have shifted towards far more nuanced understandings of colonized peoples in favor of reconstructing nuanced and integrated understandings of indigenous perception, identity, biosocial interplays, and other responses to conquest. This work merges archaeological, ecological, and bioarchaeological contexts to help understand the significance of mortuary pattern data to compare postcontact cultural outcomes in Mórrope and Eten, two contemporaneous north coast Peruvian communities inhabited by native Muchik peoples (circa late A.D. 1530s—1750). In Mórrope, a biological disaster unfolded as the survivors of conquest created a resistance-driven hybrid Andean-Iberian culture. In Eten, microenvironment and a prosperous economy buffered against similar biological experiences as local peoples became thoroughly acculturated into the Spanish sphere. These outcomes are interpreted within a multi-scalar framework of alterity to explore how this diversity reflected diverse community strategies, engagements, and perceptions of "the other" in the negotiation of indigenous agendas and identities while enduring colonial subjugation.

[210] *From Geophysics to Building a Predictive GIS Model of Archaeological Sites in the African Interior: Spatial Archaeometric Applications of the Bosutswe Landscapes Regional Survey, Botswana*

Expanding trade in gold and ivory in the first millennium linked sub-Saharan Africa to the Middle East and Asia through maritime and land-based exchange. This Indian Ocean trade supported the flow of exotic goods and ideas into the interior of southern Africa, where polities developed by the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

mid-13th century. The African experience has often focused on larger cities and coastal societies, or framed through viewpoints of those beyond the continent. In particular, landscape approaches, especially in the interior, have been few, particularly ones that integrate spatial archaeometric techniques.

Since 2014, Bosutswe Landscapes (BosLand) has combined geophysical, drone, and satellite remote sensing with traditional pedestrian survey and excavations to approach the local landscapes. This presentation introduces the BosLand project, especially our 2017 geospatial research. 2500 km² of multispectral imagery was used to locate several dozen archaeological sites around Bosutswe, most of which were previously unknown. The paper will provide an overview of the project, the decision-making process involved in obtaining imagery, the general approach used for identifying sites and the

predictive model, and early implications: practical logistics useful to Africanists interested in more fully integrating remote sensing into projects, especially those working in austere environments facing limited technological field resources.

[209] *Of Eye Rings and Torches: The Fire Priests of Chichen Itza and Their Legacy in Aztec Tenochtitlan*

A number of enigmatic human figures in the imagery of late 9th-early 10th century A.D. Chichen Itza can be identified as fire priests, men whose task was to drill, tend, and/or oversee ritual fires reenacting the primordial birth of the sun from a flaming hearth at ancient Teotihuacan. Detailed analysis of the costumes, ceremonial responsibilities, and internal rankings of Chichen's Itza's fire priests reveals strong similarities to those of later Aztec fire priests as documented in painted manuscripts, stone carvings, and early colonial writings. These men, like the fire priests of Chichen Itza, dressed as the god known to the Aztecs as Tlaloc, who was the divine patron of the branch of the Aztec priesthood responsible for fire rituals. Although interesting iconographic parallels also appear at late 9th- early 10th c. Tula, whose legacy in Tenochtitlan is well documented, the Aztec priests' physical and structural similarities to Chichen Itza are more numerous and more compelling. This suggests that the Aztecs, by some means still undetermined, were directly or indirectly drawing upon information and/or memories passed down to central Mexico from Chichen Itza.

Klembara, Nathan

[220] *In and "Out" of the Cave: Queerness on the Upper Paleolithic Funerary Landscape*

Amongst many other facets of human life, the practice of burying the dead demarcates and changes a space, it becomes imbued and entwined with the identity of the deceased. The physical act of placing a body into the ground is a place-making practice, a performative act, and, in the process, the place becomes gendered. This has been true since the origins of burial practices in the human lineage, dating to at least the early Upper Paleolithic, and perhaps earlier. This paper is a preliminary attempt to look back at the European Upper Paleolithic burial record to examine these burials as queer spaces, and as a place for queer identity construction, reconstruction, and negotiation. The Upper Paleolithic has a severely limited number of burials, and thus these burial places—both cave or rockshelter and open-air contexts—and the individuals contained within them, can be considered queer, different, and non-normative. The queer nature of the embodied identities of these burials and their location has been hereto unexplored. Through an analysis of the intersection of bodies, grave goods, landscapes, and queer theory, the fluidity and contextuality of Upper Paleolithic gendered and sexual spaces and identities will emerge.

Klemmer, Amy (University of Wisconsin-Milwaukee)

[7] *Zooarchaeological Analysis of Fishing Strategies at Rio Chico, Ecuador (OMJPLP-170)*

The Rio Chico site was occupied almost continuously for 5000 years (ca. 3500 B.C.E. to 1532 C.E.) in a region of coastal South America that is heavily influenced by climatic events such as El Niño Southern Oscillation (ENSO). Evidence suggests that occupants of Rio Chico were heavily dependent on marine resources. The fishing strategies utilized at Rio Chico sustained the community over time, which allowed for the long-term development of an economy based on the *Spondylus* trade. This combination of climatic volatility, dependence on ocean resources, and occupation history provides an opportunity to study coastal resource usage over a long temporal span. This poster presents the results of a zooarchaeological analysis of a sample of faunal remains from the Florida Atlantic University (FAU) field school excavations conducted in 1997, 1998, 1999 and 2003. All remains were identified to the class level and a subset of this sample was identified to the family level. These identifications serve as the basis of this analysis. This analysis provides a foundation for further research to compare a coastal and an inland site in Ecuador, which will contribute to an understanding of the relationship between coastal and inland sites during times of environmental stress.

Klingelhofer, Eric

[51] *Assessing Threats to Coastal Sites: A Trial Run on St Croix, USVI*

The International Association for Caribbean Archaeology's Endangered Sites Task Force is concerned about the threat to coastal sites by rising sea levels. In March 2017, a small team of Mercer University non-archaeology students participated in a project on St Croix, USVI, to determine how local populations could best provide measurable information to professional archaeologists and cultural resource managers. The five-day project assessed ten sites assigned by the USVI Territorial Archaeologist. Through trial and error, the resulting 'Mercer Method' of data collection proved that using available smartphones and GPS proved much more effective than traditional survey procedures.

[70] *Valley of No Masters: Exchanging Experiences at the Valley of the Masters, Northeastern Brazil*

Field schools, and Methods and techniques in Archaeology classes are mandatory steps to achieve Master's or a PhD degree in most graduate programs in Brazil. We, as instructors noticed a certain mismatch in students' behavior in regard to decision-making in both situations: reticence during field activities, boldness during class discussions and debates. This dichotomy seemed to be related to field experiences in which the students had fewer opportunities to engage with other "more experienced-professional" archaeologists to make decisions. Inspired by calls for a more inclusive fieldwork experience we developed a proposal (tested in 2016 and 2017) in which students were collectively in charge of all decisions. We then encouraged debates and deliberations before any final determinations, and took the occasions to present distinct alternatives of action. The experience of continuous justification of decision making, of taking such decisions in a context with no hierarchy, and later the critical evaluation of the results obtained, turned out a considerable challenge for the students. In this paper we present the results—both archaeological and educational—of this innovative approach, and ideas we intend to implement in the future.

[139] *SIBA: The Research Potential of Bahamian/TCI Museum Collections*

Project SIBA (Stone Interchanges in the Bahamas Archipelago) brings together the largest corpus of Bahamian/TCI stone artefacts ever assembled—over 300 artefacts from eight international museums, including the Smithsonian's National Museum of the American Indian and the National Museum of Natural History. In an entirely limestone environment like the Bahamas/TCI, all hard stone had to be imported: our objective is to determine the source of these exotics. Integrating studies that combine the arts with state-of-the-art minimal-invasive laser ablation sampling for isotope studies, we aim to explore the wider social, political and economic connections between the archipelago and its wider Caribbean setting. The selected artefacts, including celts and anthropo/zoomorphic carvings, have well-documented collection histories, forming an exceptionally rich corpus for investigating materials and meanings. Museum collections offer a unique opportunity to study artefacts that are now rarely encountered in the archaeological record: in the Bahamas, such artefacts were mainly deposited in caves that were largely cleared for the guano-rich soils in the 19th century. Museum collections are therefore an integral component when looking at the wider archaeological context for these islands: without them, we lose connection to a large and important body of material that had clear value and meaning.

[21] *The Late Paleoindian Cody Complex Component at Lamb Spring, Colorado*

The Late Paleoindian Cody complex component at Lamb Spring, Colorado was recently reanalyzed. While best known for its possible association with Late Pleistocene fauna, the Lamb Spring Cody component with its nearly 2,000 bison bones, seven Eden projectile points, Cody knife fragment, and two flakes has largely been overlooked and incompletely described in the literature (excepting McCartney's study of the bison bones). To remedy the situation I: (1) use prior publications, reports and the original field notes to describe and interpret the component, (2) describe the recently analyzed chipped stone assemblage, and (3) compare Lamb Spring to other Cody complex sites in the region. The Cody component is in a paleo-stream channel that directly overlies the Late Pleistocene fauna, and has two spatially discrete levels separated by 4–5 cm of sediment. The occupation levels vary in projectile point technology and raw material preference. Though made from locally available lithic materials, the tool assemblage is fragmented and heavily resharpened. The projectile points are atypical in their lack of a dominant parallel collateral flaking pattern. Two (or more) small groups of Cody hunters used a stream channel to trap, kill and process some 27 bison between the late fall/early winter and mid-spring.

[31] *Ceramics, Ground Stone and Miscellanea at the Zaragoza-Oyameles Obsidian Quarry in Puebla, Mexico*

One result of the intensive, 5-m interval surface survey of the Zaragoza-Oyameles obsidian source area in Puebla, Mexico was the recovery of several artifact classes suggestive of prolonged habitation. Ceramic and ground stone artifacts recovered indicate that domestic activities were an important component of the obsidian procurement and production economy. Ceramics tended to concentrate in areas that also contained higher quantities of ground stone, but did not correlate with any one stage of obsidian reduction. The majority of identifiable ceramic vessels were ollas and cajetes, suggestive of domestic activities. Manos and metates were the most common ground stone artifacts recovered, although molcajetes, axes, and formal, worked hammerstones also were recovered. Manos and metates exhibited considerable variation in size and shape. When these indicators of domestic habitation are correlated to the obsidian surface data, patterns of domestic crafting at different intensities across space can be observed.

[139] *Communities of Practice and Sequencing from Older Caribbean Collections in the NMAI and NMNH*

The Caribbean holdings of the National Museum of the American Indian and the Anthropology Department of the National Museum of Natural History contain material from historically important early excavations like those of M. R. Harrington in eastern Cuba in 1915 and Herbert W. Krieger in the Dominican Republic in 1928. Moreover, they include the results of early collection efforts by such luminaries as Jesse W. Fewkes and Theodor de Booy, which means that they contain some of the key specimens published in the early literature of the area. Like all major Caribbean collections assembled at an early date, these lack detailed archaeological provenance. However, they do often possess information concerning the site, municipality, or province of origin. Over six years, I have assembled a database of 1,100 small carvings of stone, shell, and bone from the Greater Antilles, including 162 from the Smithsonian. I show that despite faults in provenance information, these data can still contribute to the definition of stylistic communities of practice. Such regional communities of practice offer another perspective into current discussions of pre-Contact ethnic and linguistic diversity in the islands. Moreover, using nonmetric multidimensional scaling, I show how chronological information can be extracted from these data.

[251] *A Place to Heal: Archaeology at St. Elizabeths Hospital*

Established in 1852 as the Government Hospital for the Insane, St. Elizabeths is situated on a bluff overlooking the historic City of Washington. Charles Nichols, the first superintendent, sought to provide a therapeutic setting in a picturesque environment for mentally ill patients to recover. Originally located outside the main core of the city, the campus has witnessed massive changes over its 150 years of operation. These changes often coincided with innovative new treatment practices for the mentally ill but were not always noted in the historic record, despite annual reports to Congress and extensive map and photographic documentation. Using GIS in conjunction with targeted archaeological investigations, we georeferenced key historic maps and conducted elevation and viewshed analyses to document and confirm many of these changes to the landscape and character of the campus over its lifetime. This paper will explore some of the conclusions we have reached and address the pitfalls of exclusively relying on documentary evidence when evaluating and investigating historical sites.

[138] *Wrestling That 200-Pound Gorilla in the Room: Practical Solutions for the Care and Management of Associated Records*

In spite of the broadly recognized importance of associated records, they are often the last part of a collection to be organized, catalogued, and stabilized. Disorganized, or "lost" associated records are a source of frustration for researchers and collection managers alike. Conversely, well-organized and accessible associated records have many benefits to artifact collections including an increase in research potential, a legal foundation for ownership and control, and greater interpretive value. This presentation will discuss how the Natural History Museum of Utah is tackling the challenge of organizing, digitizing, rehousing, and managing over 150 linear feet of associated records. At the heart of this project is the premise that the care and management of archaeological associated records falls somewhere between the missions of archives and records management. As such, new professional standards should be established that meet the needs of this unique collection type.

[115] *A Summary of Chipped and Ground Stone from Room 28, Pueblo Bonito in Chaco Canyon*

Chipped stone and ground stone from Room 28 backfill included fill from adjacent rooms and lends insight to the technology used during room occupation. I summarize both debitage and formal tool analyses with a special discussion on projectile point types. Most material proportions fall within the range of those in other Chaco Canyon assemblages but with a lower frequency of Narbona Pass and Zuni Spotted Chert. General types of ground stone are discussed in the analysis and jar lid metric data suggest a connection to the cylindrical jars recovered from Room 28. Much of the other ground stone material represents food production and crafting activities, while jar lids may be related to whatever process was used in cylinder jar consumption practices.

[187] *Multidisciplinary Investigations of a Late Paleoindian Bison Butchery Event from a Southwest Texas Rockshelter*

Located in the Northeastern Chihuahuan Desert, Eagle Cave is one of the largest rockshelters in the Lower Pecos Canyonlands. Archaeologists previously excavated Eagle Cave in the 1930s and 1960s; however, no evidence had been recovered indicating Paleoindian occupation of the site. From January 2015 through February 2017, the Ancient Southwest Texas Project of Texas State University re-excavated a 4-meter deep trench through the center of this massive rockshelter in order to document and sample the complex stratigraphy. A primary research objective was to investigate the potential for Paleoindian-age deposits. During the 2016 field season we excavated into deposits older than 8500 RCYBP, and immediately exposed a scattering of fractured, cut, and burned bison bones. Among the bones were chipped stone debitage, lithic tools, decomposing plant remains, and a surface hearth containing charred bone, ash, and charcoal. Based on preliminary analyses and radiocarbon dates, this entire assemblage dates to older than 10,250 cal BP, and represents the secondary butchering and processing of a single *Bison antiquus*. This poster summarizes the ongoing spatial, faunal, macrobotanical, geoarchaeological, chronometric, and lithic analyses being conducted on this unique Late Paleoindian assemblage.

Kohut, Betsy (Millsaps College), George J. Bey III (Millsaps College) and Tomás Gallareta Negrón (Millsaps College)**[162]** *A Re-evaluation of Yotholin Pattern-Burnished: Evidence of Early Preclassic Ceramics?*

In 1958, Brainerd first described "the earliest deposits yet to come from Yucatan"—composed primarily of narrow-mouthed jar fragments recovered from the lowest strata of excavations at the Mani cenote. This type, classified as Yotholin Pattern-Burnished, has a medium-fine paste and unslipped surfaces that had been smoothed or burnished in decorative patterns.

Since then, similar wares have been recovered from Preclassic contexts at a number of other sites. Although Brainerd originally described Yotholin as an Early Preclassic type, other archaeologists have attributed it to the late Middle Preclassic. In this paper, we will revisit the contextual evidence surrounding Yotholin and discuss it in light of our work in the Puuc and recent reevaluation of Middle Preclassic ceramics in general. This reanalysis suggests that Brainerd's initial interpretation of Yotholin was correct and that it is contemporaneous with and/or slightly predates early Middle Preclassic Ek phase ceramics (900–700 BC). It is possible that Yotholin represents the earliest pottery yet identified in the Northern Lowlands. We examine the implications this would have for understanding the origins of the Maya in this region.

Kohut, Betsy [162] see Galvan, Melissa

Kohut, Lauren (Tougaloo College)**[75]** *Legacies of War: Fortified Landscapes and Political Transformation during the Late Prehispanic in the Colca Valley (Arequipa, Peru)*

During the Late Intermediate Period (AD 1000–1450), frequent warfare radically transformed the landscape of the Colca Valley in the southern Peruvian highlands. Widespread fortification not only marked a new defensive landscape, but also reflected and reinforced broader social and political transformations—including increasing settlement nucleation and the coalescence of new ethnic identities. Although many of the valley's fortifications were largely abandoned following the region's incorporation into the Inka state, this fortified landscape continued to shape social and political processes. The two largest fortified settlements not only continued to be inhabited, but grew and were transformed into local Inka administrative centers. This paper examines how the fortified landscape of the Colca Valley shaped long-term social and political processes drawing both on analysis of the importance of fortifications in the changing settlement patterns in the valley, and the local transformations of the large fortified settlements of Auquimarka and Malata. In doing so, this paper expands upon the notion of fortifications as "landscape patrimony" (*sensu* Arkush 2011), by exploring how defensive landscapes not only shape and entrench social and political relationships, but also how such built landscapes of war are themselves reimagined and reinterpreted in the face of social and political change.

[235] *Moderator***Kolata, Alan (University of Chicago)****[273]** *Discussant***[273]** *Chair***Kolb, Charles (National Endowment for the Humanities (Retired))****[69]** *Revisiting Clay Smoking Pipes*

An assemblage of 280 white clay smoking pipe fragments were recovered from a disturbed context during the construction of a marine basin and wharf at Barcelona Harbor, New York, on the southeastern shore of Lake Erie. Apparently packed in a wooden box or crate, this collection represents one of the largest unique and homogeneous collections fabricated during a brief period in a single manufactory from only a few molds. I summarize descriptive and quantitative analyses, probable provenance, and focus on date of manufacture. English pipe stems are assessed using four procedures: Harrington's (1954) histogram of time periods; Binford's (1962) linear formula; Hanson's formulas (1971) and the Heighton and Deagan formula (1972). Harrington's histogram of five basic time periods proved useful but the idea was critiqued and expanded; Binford converted the progression an easily-understood mathematical straight-line regression formula applied to most pre-1800 British colonial and federal sites. However, Noël Hume and Walker provided examples of Binford's formula that yielded dates inconsistent with other dating methods. Hanson proposed ten straight line regression formulas to replace Binford's single formula, and Heighton and Deagan developed a curvilinear regression formula based on bore size research. The results are contrasted.

[230] *Under the Church Bell: Reducción and Control in Spanish Philippines*

The Spanish conquest of the Philippines redesigned the indigenous landscape to adhere to the idealized orthogonal plan outlined by King Philip II's Ordinances of 1573, centered on the church plaza. This reconfiguration facilitated the successful political, economic, and religious control of the colonial possession. An aspect of this resettlement plan is the concept of Bajo de Campana (under the bell) that implied control through the ringing of the church bell. The plaza complex, which is exemplified by the policy of reducción, projects a Spanish ideal Catholic Society, whereby the configuration of the physical landscape was ordered. Reducción aimed to consolidate colonial control over Philippine indigenous communities by compelling prominent individuals to relocate into poblaciones within hearing distance of church-bells. Bell ringing ordered daily life by signaling times to congregate and by marking special occasions. The audibility of church-bells also marked the extent of the Crown's territorial holdings. To understand the processes associated with this colonial accommodation, we explore the social, religious, and environmental ramifications of Spanish settlement-building programs in the Philippines by examining spatial, acoustic, ethnohistoric, and archaeological data from plaza complexes located at two Spanish-era church sites: Quipayo and St. Francis of Assisi (both established in 1578).

[282] *The Dread of Something after Death: Ownership, Excavation and Identification of World War II Axis Combatants in Europe*

Human remains possess an indexical quality that references once-living people. Human bone may also serve as a symbolic representation of larger ideas such as honor, vengeance or injustice. As such, human remains, as evidence of past criminal actions, have the ability to bring communities together, but also to tear them apart. In regard to the remains of soldiers who perished in the European theater during World War II (WWII), the presence of remains may serve to reinforce the perceived moral failings and criminality of other communities. However, they may also underscore the idea of victimization, even among people who might also have been considered the perpetrators of atrocities. Among the German dead from WWII, the remains themselves have highlighted the mythologized suffering of the German soldiers—particularly in the East—at the close of WWII, while also serving as a terrible reminder of the pain caused to the myriad communities victimized by the Reich. Meanwhile, the excavation of potentially Italian or Austrian Axis combatants has proved more complicated because the discovery of these soldiers disrupts long established narratives of Italian and Austrian victimhood.

[5] *The Bryant Site: Five Prehistoric Loci in the Esopus Creek Drainage*

Excavation of large sites in the Hudson Valley is often limited to the availability of resources and labor. The Bryant Site of Ulster County, New York, is a Late Archaic site located on approximately 54,000 m² of horizontal surface area on privately owned farmland. Scientific sampling of the site was conducted through survey using a grid-based plan. Each grid square was analyzed for debitage, fire-cracked rock, and lithic artifacts. The results of each unit were contrasted and compared. Through analysis of each square, five possible loci of prehistoric activity were discovered. While surface collections are not without their disadvantages or bias, and cannot replace excavation in terms of evidence collection, this process yielded data which was used to infer potential site use, seasonality, and dietary behavior. The data collected opens the door for future excavation and potential testing of long-term prehistoric settlement in the area.

[133] *Foodways and Technological Transformation in the Upper Great Lakes: A Multidimensional Analysis of Woodland Pottery from the Cloudman Site (20CH6)*

A novel combination of analytic methods is used to address the decades-long debate about diachronic subsistence pattern change during the Woodland period (AD 1—1600) in the Upper Great Lakes of North America. While some have argued for dietary continuity throughout the regional Woodland, others maintain that certain specific resources—including fish, wild starchy plants, and/or maize—were more intensively exploited over time. The Cloudman site (20CH6), located on an island off Michigan's Upper Peninsula in Lake Huron, is a multicomponent occupation spanning the Middle through late Late Woodland periods. The ceramic assemblage is therefore ideal for assessing dietary and technological change through time. Functional pottery analysis (of technical properties and use-alterations traces), stylistic pottery analysis, microbotanical analysis, absorbed lipid residue analysis, stable isotope analysis, and AMS dating are used in tandem to construct a chronological sequence of diet, cooking habits, and cooking technology and the relationships between them. The rich data resulting from the complementary nature of these diverse methods demonstrates the potential applications of this analytic suite to long-standing archaeological problems in other contexts.

Koole, Edward (Edward Koole)

[127] *Paleo-Indian Evidence from Rock Shelters of the Pains Region, Southeastern Brazil: Typology, Technology and Chronology of the Lithic Material and Its Classification in Three Horizons*

This presentation describes the archaeological context and the lithic variability for the paleo-indian period of the Pains region, an extensive karst situated in the upper São Francisco river valley, state of Minas Gerais, Southeastern Brazil. It gives an overview of what is known for the region using evidence from four limestone rock shelter sites, with a total area of 28m² excavated, the most important site being the Gruta do Marinheiro cave (20m²),

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

and propose the separation of the lithic material of the region in three main industries, differentiated in terms of technology and typology as well as chronology, called Horizons, that reproduce regionally, the materials and archaeological contexts found in the Central as well as the Southern territories of Brazil.

Koolstra, Francis [34] see Cakirlar, Canan

Koontz, Rex (University of Houston)**[128] *A Tajín Deity Associated with Decapitation Sacrifice***

This presentation investigates the narrative context of a Tajín region deity whose diagnostic characteristics include a large hank of hair and an extended upper lip.

The figure appears in narrative scenes with the major Tajín deities, often playing what seems to be a subsidiary role. The most important association in these scenes is with a liquid-filled temple that plays a key role scenes of ballcourt ritual. The same deity appears in pars pro toto representations of sacrificial scenes with numerous figures from the Tajín court. Finally, the deity also appears in a complex aquatic scene on a portable sculpture. Certain consistencies in the imagery across narrative contexts and media suggest that this figure embodies the fruit of particularly important decapitation sacrifices. The depiction of decapitation sacrifice as a supernatural suggests that Tajín participates in the “animate head” symbolics that have been identified for large areas of the Americas, as described by Gillespie and others.

Kornfeld, Marcel (PIRL—University of Wyoming) and Mary Lou Larson (PIRL—University of Wyoming)**[127] *Things Forgotten: The Unique of the Hell Gap Site***

Forager campsites are commonly thought of as locations where social activities occur, but most archaeologists focus on subsistence (butchery, processing), stone tool production and use, and how these systems relate to mobility strategies. The record is often silent when it comes to the behaviors incidental to what appears central economic endeavors. Often camps yield information beyond subsistence. Ochre, needles, beads, bone rods, structures, and context of various activities provide more holistic evidence of Paleoindian lifeways. Our paper considers implications of such remains at the stratified Pleistocene/Holocene boundary Hell Gap site.

Kosakowsky, Laura (University of Arizona)**[258] *“Pots, Potters, ...and Politics”: Classic Period Ceramic Spheres and Systems at Aventura, Northern Belize, and the Legacy of Joe Ball***

Early work in the 1970's by Joe Ball on Northern Belize ceramics from the site of Aventura highlighted its geopolitical location between multiple spheres of interaction. These spheres, reflected in the ceramics of the Classic Period, demonstrate that Aventura's intermediary position between the cities of the Petén to the west, and the Yucatan to the north no doubt contributed to its success and long occupation. My own research on the Aventura ceramics, begun in 2015 as part of the Aventura Archaeology Project, supports Joe Ball's early observations on Classic Period ceramics in Northern Belize. Furthermore, his important definitions of ceramic spheres and systems provide an excellent way to frame Aventura's long chronology and inter-regional connections through time. While still in its preliminary stages, I am hopeful that continuing work on the ceramics of Aventura will go beyond establishing a site and regional chronology, and highlighting inter-site connections, to telling us something more about “ancient Maya economic systems, political history, ceremonial behavior, ideology, societal structure, and community organization.” (Ball 1993)

Kosakowsky, Laura [147] see Robin, Cynthia

Kosiba, Steve (University of Minnesota)**[230] *Crumbling Infrastructure: Archaeological Perspectives***

Recently, the term “infrastructure” has gained a remarkable degree of traction in both academic and political discourses. Politicians, from the left and right, bemoan what they term “crumbling infrastructure,” offering fixes by way of material and technological improvements to roads, waterways, cities, and energy grids. Scholars draw on and expand posthumanist theories to analyze and expose how infrastructure does not just passively support social aims, but actively shapes (and subverts) human intentions. These discussions sharpen focus on the material characteristics and necessities of infrastructure, but frequently neglect to equally take into account the ideological mechanisms—processes of labor coordination, perceptions of progress, or projects for sustainable ecology—that are essential to and inseparable from infrastructure. With this paper, I ask how archaeologists, with their unique ability to record and interpret long-term socio-material processes, might add to such discussions of infrastructure. I argue that “crumbling infrastructure” is a misnomer because it defines infrastructure as fixed materials rather than fluid entities that are parts of broader assemblages comprising things, people, and ideas. I present data from Cusco, Peru, during early Spanish colonization to examine the interwoven ideologies and materials that can bring infrastructure into being, and relegate it to ruin.

Koskey, Michael [250] see Skinner, Douglas

Kosyk, Katrina (McGill University)**[263] *Communities of Engaged Performance: Investigating Soundscapes and the Sonorous Past***

The relationship between individuals and urban soundscapes can tell us about the personhood and sonic practices of people in the past. To reconstruct the interaction between a musician and audience in archaeological contexts, I introduce a novel theoretical framework called ‘communities of engaged performance’ (CEP). CEP is defined as the transmission of knowledge through performance resulting in variable group-specific sound practices. CEP is derived and builds upon theories of ‘communities of practice’ and is identifiable in the archaeological record as intentional modifications to both space and sound-related artefacts. CEP is especially pertinent to the discussion of multicultural social organization, because it denotes group identity based on consistencies within practices rather than by ethnic origin. For example, variation in instrument design, playing of a musical instrument (gestures, finger positions, etc.), or in soundscapes might suggest the presence of several distinct communities of engaged musical performance. On the other hand, consistency or shared practices across groups might reflect the development of a single performance community. A case study from Central America will explore these different aspects of CEP in a multi-ethnic landscape.

[265] *Deciphering Social Structure: A Cognitive Approach in Examining Casma and Chimú Ceramic Iconography*

The choices groups make in the type of decorative techniques and styles on ceramics are referential to key components of a group's social structure. This research examines social aspects of the Casma and Chimú using a cognitive approach in analyzing iconographic elements on elite ceramics from Pan de Azúcar, located in the Nepeña Valley, Peru. Casma ceramics are locally made vessels where no two are alike and are characteristically defined by the presence of circle-and-dot and serpentine appliques. Comparatively, Chimú ceramics are mass-produced mold made vessels that are identifiable by its' polished exterior decorated with intricate designs and bird and monkey appliques. Based on the type of iconography the Casma and Chimú used for social expression we argue that the Casma were an internally driven culture while the Chimú were an externally driven culture. Additionally, elements of Chimú iconography show evidence for their imperialistic disposition and give us insight into the interaction between the Casma and Chimú during the Late Intermediate Period (A.D. 1000–1400) in the Nepeña Valley.

[214] *Diagrammatic and Interactive Relighting Visualizations of Pictographs: Case Studies on Pinwheel, Boulder and Pleito Cave*

This presentation discusses two complementary approaches for visualization of pictographs; interactive relighting and diagrammatic representation. Visible and false colour Reflectance Transformation Images (RTI) provide enhanced visualization of texture in combination with colour enhancement. By extension, the proposed techniques offer the opportunity to explore the characteristics and application of paint as well as the layering and preservation state of pictographs. The extracted information can be formatted according to DOT language syntax and rendered in GraphViz as diagrams. The resulting diagrams are not only alternative ways for communicating analysis results but also useful tools for enhanced detection of patterns within a single pictograph and across panels. As demonstrated by case studies on Pinwheel, Boulder and Pleito cave (CA-KER-77), which showcase different scale and level of complexity, the comparative assessment of interactive relighting and diagrammatic visualizations is a step towards a more holistic approach for rock-art recording, documentation and analysis, that can be further enriched by spectroscopy and 3D digitization.

[243] *Soils, Sedimentary Rocks, and Scale: Recent Geoarchaeological Investigations at Colha, Northern Belize*

The Maya site of Colha is located on a karstic doline that is dominated by Tertiary and Pleistocene limestone and marls. This low-lying area, known locally as the Cobweb depression, encompasses a complex wetland system that is affected by Holocene sea level rise, human-induced vegetation changes, and both natural and anthropogenic erosional sequences. The dynamic landscape, coupled with a long history of human occupation, places this site in a complex geographic and cultural position within the greater Maya Lowlands. This paper focuses on the interplay between natural soil formation sequences, the built environment, and the temporal changes in resource extraction and utilization within the Colha core. Here, we specifically build upon previous research on soils and sediments of the greater Cobweb Swamp depression and how these soils form onsite. Accelerator Mass Spectrometry (AMS) dating, Magnetic Susceptibility, and Loss On Ignition methodologies are employed to further characterize the present soils and geologic resources. Geochemical and elemental techniques are applied to lime plaster samples in order to determine sourcing and production during Preclassic occupation. The data proffered from these analyses highlight the unique geologic context of Colha, demonstrate how these environmental resources were manipulated, and supplement broader work on local human-landscape interactions.

[302] *Deviancy, an Alternate Means of Child Veneration at the Maya Site of Colha*

The veneration of space is a process that at times incorporates deviant practices as a method of signifying key importance. The deposition of burnt infant remains and associated grave goods diverges from burial norms at the Maya site of Colha. In May of 2017, archaeologists with the Programme for Belize Archaeological project returned to the site after a multi-year hiatus. The burnt skeletal remains of an infant, between the ages of 1.5 and 2.5 were found in association with burnt pottery sherds, bifaces, and shells. The burial deviates from Maya inhumation practices at Colha and in Northwestern Belize generally and therefore signifies ritual practice of great import. The interment of remains and grave goods are associated with the structure 2032 in the 2000 sector. The location, presence of burning, and differential inhumation signifies the importance of this structure and are hypothesized to have contributed to a dedication or termination ritual of the associated structure. We explore the use of burning and child inhumation practices as a ritual method for structure commemoration.

[252] *Uaxactun as the Preclassic Dominant of Central Peten*

In the beginning of the 20th Century Uaxactun was considered to be the cradle of the Maya civilization. Later, other monumental Maya centers were found and scholars lost interest for Uaxactun. The former popularity of Uaxactun was interpreted as just a coincidence because the first large excavations were carried out there. Newly identified important Maya sites were considered to be older and more interesting. The new archaeological project in Uaxactun has dealt with the Preclassic horizon of the site for the past 10 years and recent results confirm that the first impressions 100 years ago were not so far from the reality. Uaxactun was ruled by the first Maya king's dynasties and has the biggest king's residence in the Preclassic Central Peten. Among the extraordinary findings are the largest stucco masks of the Maya world, amazing and large stucco decorations, a dynastic shrine with preclassic inscriptions on a jade scepter, fine Preclassic inscriptions on stelae and last but not least astronomic complexes of extraordinary accuracy. Fine art, early inscriptions, richness and monumentality of architecture lead us to the conclusion that in Preclassic times Uaxactun was politically and culturally one of the most important cities of the Maya world.

[170] *Economic Institutions in Ancient Greece and Mesoamerica*

New studies have led to a deeper comprehension of economic variation and change in Late Postclassic Mesoamerica and the Archaic and Classical Greek world. Archaeological data on city-state settlement patterns, specialized production, trade, and household consumption, and new archival material and re-analysis of texts, have replaced primitivism, substantivism, and ideal-types.

In urbanization and demographic scale the two areas are comparable. Mesoamerican and Greek agricultural production was not simply for subsistence, but was market-oriented and market-dependent. Local and long-distance trade often functioned by market mechanisms. The economies had the capacity for real growth beyond Malthusian pace-keeping.

Greece and Mesoamerica contrast in their current states of method and theory. Mesoamerica has better samples of city and hinterland settlement patterns. Ancient Greece has fuller textual sources. Research on the Greek economy is more in touch with economic theory.

I focus on two differences. The Old World used silver and state-issued coinage as money; Mesoamerica had goods monies. In the Old World the firm, or corporate group for jointly carrying out economic activities, was larger than in Mesoamerica, where the household was the locus of specialized production. These differences had consequences in the relative capacity for appropriation and accumulation.

[39] *Good Living in Hard Times: De-urbanization and Personal Wealth in Nineteenth Century New Market, Maryland*

New Market is a small community in Frederick County, Maryland, whose origins and early nineteenth century economic peak are tied to travel and trade, on the National Turnpike. Following the development of the B&O railroad during the mid-nineteenth century, use of the turnpike declined, subsequently shrinking the town's economy.

Excavations sponsored by the Maryland State Highways Administration have recovered datasets from two properties in New Market. Identified components include a late eighteenth century tavern or inn, an early nineteenth century home, mid-nineteenth century parsonage and workshop, and a late nineteenth to early twentieth century African-American home.

Faunal remains collected from each component were used to establish the relative economic and nutritional value within each assemblage. Access to meat at each component was then measured against the economic potential of the community as a whole, as documented in the historic record. Preliminary results show that decline in personal wealth, as measured by ability to purchase meat, lagged behind the decline of New Market as a commercial center. The lag may relate to improvements in trade and communications, which had allowed for the decentralization of the local economy, which in turn allowed individual actors to weather economic declines at specific nodes.

[8] *Interpreting Palimpsest Rock Art in the North American Southwest*

This paper examines what might be called the "palimpsest panel" rock art tradition of the northern Rio Grande region of New Mexico. Palimpsest panels are rock faces with petroglyphs that have accrued in a layered fashion through time. Prior research into such panels has typically focused on questions of chronology, each layer representing a distinct culture-historical era of iconographic production or a chapter in a linear chronology. Here, however, I move away from the traditional chronological approach, in order to examine the iconographic data present in the form of representation itself, the so-called palimpsest. The way that meaning develops through the act of layering itself is a process by which the icons interact and modify one another. Such an approach reveals not only the rich, information-laden periods between discrete chronological chapters but also demonstrates that palimpsests are far more than the sum of their parts.

[173] *Canals, Sacbeob and Defining Space in Ditched Agricultural Fields in the Three Rivers Region, Northwestern Belize*

In 2016 the Northwestern Belize Lidar Consortium acquired nearly 300 square km of LiDAR imagery that covers large areas of ancient Maya agricultural systems, including ditched and raised fields, reservoirs, terraces, and sacbeob. This new imagery allows us to map beneath the canopy and shows that over nearly 20 years without LiDAR we studied only a small spatial sample of these complex systems. We have tested these systems with multiple excavations, and used multiple proxies such as paleoecology, elemental geochemistry, and isotope analysis to reconstruct Maya management within wetlands. Through new LiDAR technologies and continued on the ground excavations, the study of these Maya agroecosystems has entered a period of great dynamism. The coverage of systems in northwestern Belize indicates intensive, polycultural complexes of upland terraces and wetland fields. Here, we present our current state of knowledge of the Birds of Paradise agricultural zone based on previous research and our new, ground-truthing through mapping and excavation efforts from the summer 2017 field season. Based on these new efforts we can better understand wetland agriculture both spatially and temporally within the framework of Maya urbanism and agricultural management in the Three Rivers Region.

[141] *A Technical Study of Post-Fire Painted Paracas Ceramics: Regional Exchange and Material Culture*

The Paracas culture and its impressive pottery tradition developed along the south coast of Peru in the Early Horizon period (approximately 800–100BC). A scientific study of manufacturing techniques and materials of post-fire painted Paracas ceramics at the American Museum of Natural History (AMNH) and Metropolitan Museum of Art (MMA) found a correlation between changes in material use and iconography and vessel form across time. Differences between colorant composition in the Formative/Early (approximately 900–500BC) and Middle (approximately 500–400BC) Paracas Periods suggest a shift in material usage, which correlates with likely cross-cultural exchange and interaction with the Chavin culture to the north. Additionally, a basic continuity in the production techniques utilized to form the Paracas ceramics and decorate their surfaces suggests an extensive network of regional exchange and collaboration. Differences identified in the paint plant binders further illustrate the importance of examining archaeologically excavated pieces in order to correlate differences that may be attributable to chronological sequencing or regional differences.

Kristan-Graham, Cynthia (Auburn University)

[28] *The Poetics and Politics of Acoustics at Chichen Itza, Yucatan, Mexico*

An archaeology of the senses expands the understanding of physical, tangible aspects of place to include qualities that are unseen, silent, or otherwise not readily perceptible. My paper analyzes acoustics at the late Maya capital of Chichen Itza. Sound—especially the human voice, animals, music, ritual, and dancing—were part of Chichen Itza's atmosphere. An analysis of soundscapes, along with the intersection of architecture, planning, and acoustics, augments what is known about the site's settlement, rituals, epigraphy, and imagery. For example, sounds could be heard in only a part of this large site. Consequently, sound at ground level and inside or atop buildings can be understood as limited resources available to different audiences and sectors of the site. Using digital archaeology to plot soundscapes, I consider how acoustics may have influenced the site plan; how acoustics may have embodied political and social concerns; and how Maya notions about sound expand an understanding of Maya places.

Kristiansen, Kristian

[113] *The Maritime Mode of Production: The Role of Seafaring in Bronze Age Societies*

As exemplified by Viking and Bronze Age societies in northern Europe, we model the political dynamics of raiding, trading, and slaving as a maritime mode of production (MMP). It includes political strategies to control trade by owning boats and financing excursions, thus permitting chiefs to channel wealth flows and establish decentralized, expansive political networks. Such political institutions often form at edges of world systems, where chieftains support mobile warriors, who were instrumental in seizing and protecting wealth. Particular properties of the MMP as relevant to Scandinavia are the fusion of agro-pastoral and maritime forces of productions.

[26] *Thunder, Lightning, Wind, and Rain: Exploring Engagements with Elemental Entities in the Closing of Emerald*

The Emerald Acropolis is an early Mississippian shrine complex constructed atop a high upland ridge approximately 25 kilometers east of Cahokia in southwestern Illinois. The termination and abandonment of a suite of special-use buildings located along an isolated spur at the base of the main ridge is strikingly different than the termination of similar non-domestic buildings throughout the region. These buildings, including large public structures, shrines, temples, and a sweat lodge, are adjacent to one of several ancient springs that would have been a powerful presence at the site. The closing of this portion of Emerald sometime during the early part of the Stirling phase (1100–1200 CE) is rife with water symbolism, including structured water-lain deposits and offerings that have ethnohistoric associations with Thunderbirds and violent thunderstorms. In this paper I establish thunder and associated elemental forces as sentient entities in the Mississippian world, and explore the engagement with them by those Cahokians concerned with the closure of this isolated cluster of buildings. Understanding Cahokians' relationships with these entities may shed light on the shifting socio-politics of the region during a potential time of stress

Krueger, Bradley (National Park Service)

[202] *Of Wharves and Watercraft: Exploring the Maritime Archeology of Theodore Roosevelt Island*

Situated in the Potomac River within the District of Columbia, Theodore Roosevelt Island serves as a living memorial to the 26th president of the United States. Secluded from the bustling capital city, the island's rich history extends beyond the memorial itself. It served as a site of American Indian occupation in the pre-contact era, hosted John Mason's plantation beginning in the late eighteenth century, was the training ground for the 1st U.S. Colored Troops during the Civil War and then home to African American refugees fleeing the South, and finally used for various recreational purposes through the early twentieth century, all prior to becoming a presidential memorial. Tightly woven into this history is a distinctly maritime thread, as the island could only be accessed by water prior to 1807. Even afterwards, water-based transportation and recreation continued to take place within the island's unique landscape. Remarkably, remnants of these maritime components are still preserved on the island today. From wharves to watercraft, this presentation summarizes the maritime history of the island and highlights two maritime archeological features.

[224] *Impact of Oyster Overharvesting in Southwest Florida by Calusa Native Americans*

Recent research has demonstrated that overharvesting of Eastern oysters (*Crassostrea virginica*) by Calusa Native Americans was severe enough during the Caloosahatchee cultural period (500 BC–AD 1500) to have influenced the population demography of the shellfishery (Savarese et al., 2016). A shift to smaller individuals without a change in oyster growth rate was documented from the Late Archaic into the Caloosahatchee when Calusa population size increased considerably in the region. Modern oyster populations exhibit a return to Late Archaic size, suggesting that the Calusa did not impose a permanent genetic change on oyster capacity for growth. These patterns were displayed for two estuaries in Southwest Florida: Estero Bay and Pine Island Sound. New data from recent excavations from Mound Key, Estero Bay, further support these interpretations. 35 samples spanning ~

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

AD 1000–AD 1400 all exhibit similar small sizes consistent with the Late Caloosahatchee period across the broader region. Additionally, taphonomic grading (sensu Savarese et al., 2016) also demonstrates that Mound Key's midden oysters were harvested for consumption, rather than mined strictly as building material. The relatively pristine preservation of oyster valve interior surfaces is consistent with the removal of oysters from their estuarine environment while alive and still articulated.

Krug, Andrew (University of Missouri), Kyle Waller (University of Missouri) and Christine VanPool (University of Missouri)

[225] *Isotopic Approaches to Marine Shell Exchange in the Southwest*

Excavations have uncovered millions of marine shells throughout the Southwest. However, it was not an easily obtainable resource. The nearest possible location was the expansive shorelines of Sonora, Mexico. Archaeological literature is full of hypotheses regarding shell procurement and exchange—models of down-the-line trading, least cost, prestige, and group membership. Each of these hypotheses agrees that where and whom the people of the Southwest interacted with to acquire marine shell are important to understanding regional exchange. A narrower geographic location would offer a more comprehensive understanding of the interactions between the procurers of shell and those that sought the molluscs. In this study, we further studies of economic interaction by comparing carbon and oxygen isotope ratios of Olivella, Conus, Glycymeris, and Nassarius shell from 76 Draw, a Casas Grandes site near Deming, New Mexico, with several published modern Gulf of California datasets. Building upon previous isotopic analyses of Southwestern shell, we determine the provenience of marine shells from 76 Draw and propose a model of marine shell exchange for the Casas Grandes world.

[88] *Archaeoethanatomical Analysis of Mortuary Practices in the Prehistoric Sonoran Desert and Implications for Interpreting Sickness through Postmortem Processing*

The La Playa archaeological site in the Sonoran Desert represents one of the earliest agricultural settlements in northwest Mexico. Over 310 mortuary features have been uncovered during salvage excavations since the site was discovered in 1930, revealing a wide variability in mortuary practices that may reflect specific treatments for pathological or transgressive individuals after death. This paper describes analyses of burials uncovered during the 2017 field season utilizing the taphonomy-centered archaeoethanatomical approach to excavation and interpretation. Using this approach, specific consideration was given to a number of burials with destructive cranial lesions that may be evidence for the earliest known cases of treponemal disease in the North American Desert West. Additionally, deviant burials uncovered during past excavations were reconsidered for evidence of pathology only visible using archaeoethanatomical analyses. Analysis revealed new insights into the mortuary behavior of these early agriculturalists, particularly concerning corpse processing before primary inhumation as well as cultural understandings of sickness. This has implications regarding social organization and the array of observed burial patterns at La Playa, from cremation, single and multiple burials, and deviant burials. These findings paint a broader picture of prehistoric inhabitants of the Sonoran Desert for whom limited cultural material has survived.

Krus, Anthony (Scottish Universities Environmental Research Centre) and Charles Cobb (Florida Museum of Natural History)

[119] *The Mississippian Fin de Siècle in the Middle Cumberland Region of Tennessee*

Bayesian chronological modeling is used to investigate the chronology for a large-scale human depopulation event during the Mississippian period (A.D. 1000–1700) known as the Vacant Quarter phenomenon. The Middle Cumberland Region (MCR) of Tennessee is within the Vacant Quarter area and six villages from the final phase of Mississippian activity in the MCR have been subjected to radiocarbon dating. Complete radiocarbon datasets from these sites are presented within an interpretative Bayesian statistical framework. The results provide a unique history of each settlement and demonstrate that Mississippian occupations at each site likely terminated in the mid-to-late fifteenth- and possibly early sixteenth-centuries A.D., which is 50–100 years later than the most recent estimate for the timing of the Vacant Quarter. Mississippian abandonment in the MCR was relatively quick, likely occurring over less than a century. The exact reasons for abandonment are not entirely clear but appear to be linked to climate change. A radiocarbon simulation experiment indicates that future robust radiocarbon dating with well selected samples could greatly improve the chronological precision for this late Mississippian activity.

[238] *Digital History and Storytelling through Routt National Forest Past and Present Photographs*

Archaeology is changing from the data collection and specialized publishing to gaining deeper knowledge from past collections and sharing them to the wider public. Digital archives are now easily accessible with open source tools and the internet, which allows not only for collaboration with other researchers outside their agencies but engages a larger public with cultural heritage. This poster describes a digital archaeology project that uses historical photographs to engage and inform the public about the Routt National Forest in Northwest Colorado. It presents the methods used to digitally archive historical materials as well as employ these materials in diverse ways in digital exhibits that include mapping and multi-media. The multiple layers of information allow the public to explore Routt in order to learn about the early years of the forest and changes in forest structure, get digital access to restricted or inaccessible sites, as well as help plan their next trip to the forest. By digitally archiving photographs and using digital tools, Forest Service employees and the public can gain a new perspective on the past landscape areas they are studying for present-day heritage projects.

[6] *Crafting Process and Usage of "Axe-God" Jade Pendants in Pre-Columbian Costa Rica*

The "axe-god" jade pendants form the majority of Costa Rican jade artifacts. These pendants were valued for their "celt like shape" and did not function as real axes. Interestingly, some pendants do have abrasions on their axe edges. Because of that, it has been proposed that prior to being reworked into a corporal accessory, some of these pendants had been used as real axes or other tools. The "axe-god" pendants consist of two parts; the superior part with decoration of human or animals, and the inferior part presents undecorated axe. This unique shape of "axe-god" is also can be seen in gold, bone, and shell artifacts in Costa Rica. Hence, the inferior part of the axe pendants may have important symbolic meaning, and focusing on the axe part is of great significance. Both the crafting procedures and the basic form from which the pendant is shaped are closely related to the pendants

usage. In this study, a digital microscope was used to analyze use-wear and crafting techniques. As a result, I show that there were several ways to elaborate the "axe-god" possibly reflecting a variety of crafting groups.

[4] *Material Geographies of Multi-family Neolithic Households*

This paper explores how people within Neolithic villages were potentially connected to co-resident multi-family households, and considers the potential material footprint of multi-family households within Neolithic villages. As seen from ethnographic cases, in some cases residential buildings of House Societies had a range of functions including as dwelling locations, origin-places, council houses, or meeting-houses. Echoing other research this paper decouples the social unit of the House from a single residence, and explores the case study of Çatalhöyük, in which the House can be modeled as linking multiple residential building. This paper provides insight into how members of Neolithic house societies appear to have used different building, rooms and / or spaces, in different ways. I argue that among house societies where people resided in a complex of buildings, select houses were invested with greater symbolism, were actively maintained as a means of perpetuating the House. Study of Çatalhöyük burial practices demonstrate that the living physically moved deceased household members from specific buildings / rooms where they slept, worked, and eat food, to pre-identified rooms at death.

Kulick, Rachel (University of Toronto)
[146] *An Urban Micromorphological Perspective on Neopalatial Environmental Changes at Bronze Age Palaikastro, Crete*

Transitional phases between settlement periods on Bronze Age Crete are often associated with 'natural' destructive events. However, it is unclear whether these 'natural' destructive events and subsequent shifts in material practices were influenced by anthropogenic or environmental processes. For example, the end of the Neopalatial period on Crete occurred in the LM IB period; some researchers view LM IB destructive fires as indicative of human action during a phase of social and political instability, while others reason that destructive fires followed a massive natural disaster. Micromorphological evidence from archaeological sequences can correspond to occupational and transitional phases and provide information on transformations in the surrounding environment, creating a microecological narrative. These narratives can distill social responses to environmental stresses from the archaeological record. New micromorphological evidence from the 2013–2015 Palace and Landscape at Palaikastro excavations, from the previously unknown neighborhood on the southeast edge of the main Bronze Age town, identifies some of these socio-natural responses. Micromorphological evidence from this neighborhood of three newly-excavated buildings illustrates variations in site formation processes and establishes a local, microecological narrative for the Neopalatial (MM IIIA—LM IB) period and associated transitional periods, which may be connected to larger regional and Mediterranean narratives.

Kuma, Dela
[32] *Foodways in Atlantic Era West Africa—Ghana: Towards an Archaeology of Daily Life*

In the context of Africa, foodways are usually portrayed very differently than in the archaeology of food literature. Food in West Africa is depicted by its primary historians as shrouded in continuous food insecurities and largely lacking differentiated cuisines. However, recent archaeological and historical research in Atlantic era West African foodways have highlighted the dynamic nature of West African foodways. Despite these advancement, the full processes through which American crops became integrated into local African foodways is poorly understood. This paper critically reviews how Africanist researchers have discussed the incorporation of American crops into local foodways. Building on these works, I show how we can trace the impacts of local food choices on the broader Atlantic trade through my proposed ethno-archaeological research in Ghana-Amedeka. This paper situates these issues within the Atlantic era in West Africa. The Atlantic trade brought with it networks of connections and change, however these interactions did not happen in vacuum. They occurred within local situated social, political, economic, and historical contexts. I argue throughout this paper that the silence on these local social processes that shaped the contours of the Atlantic trade portray the multidirectional relationship that characterized the trade as unidirectional.

[85] *Political Authority and the Creation of Wilderness: American National Parks and Mexican Eco-Archaeological Parks*

Over the last several decades, scholars have reexamined the importance of spatiality to human life and argued that space is social, relational, and that it produces and is produced by social relationships. This reconceptualization of space has highlighted the ways in which the production of landscapes is integral to the creation, maintenance, and negation of social inequality and political authority. Recent archaeological approaches to studying inequality through landscape have taken a variety of forms, including analyses of political architectonics, panoptic spaces, and pre-existing places. An equally important practice includes transforming, or claiming to transform, wilderness into a built environment. Such claims affirm rulers' abilities to impose order on chaos and to control the natural, or seemingly natural, world by destroying it. This presentation argues that political leaders bolster their authority not only by proclaiming their ability to turn wildernesses into built environments, but also by emphasizing their ability to turn built environments into wildernesses. Put differently, political regimes not only claim to conquer nature; they also claim to create it. To examine this argument, the presentation will compare the creation and development of American National Parks and Mexican eco-archaeological parks, focusing on the relationships between governmental authorities and indigenous peoples.

[181] *The "Private(s)" Is(Are) Political: Girding One's Loins for Work, for Battle, for Provocation, and Ungirding for Insurgence*
Many societies archaeologists seek to understand are societies of primary orality. They are "lifeworlds" of primary subsistence. Their study demands a multiplicity of approaches. Certainly one needs a sensitive yet hardy material gaze (and touch). Further, one should seek sensuous engagement in subsistence and celebration. Additionally, one should cultivate an incitement to imagine how the poetic and philosophical, of both reflective thought and of speech, are anchored in the material experiences of the quotidian and the exceptional. Engaging in the challenges announced above, we discuss the Malagasy loincloth/salaka not only as an icon, index and symbol, but also as "matter" that mattered in the state politics of the Malagasy highlands. The salaka serves/ed as an icon of masculinity and of legitimate claim to rule, and as an Index of age, nobility, and "shame". It further served as a political symbol of incitement to competitive engagement. Yet, it also served as physical

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

material in rebellion against imposed political authority and consequently as a symbol of cleverness/ruse in such contestation. Our discussion draws on archaeological evidence and recorded oral traditions from the time of 18th century “state” formation in central Madagascar, and from recent ethnoarchaeological fieldwork in the central highlands of Madagascar.

[118] *The Fast and the Furious. Innovations in Archaeological Visualisations at the Beginning of the 21st Ct.*

The aim of the paper is to discuss current possibilities of complex approach to 3D virtual presentation of archaeological information, both to public and professional archaeologists. Virtual archaeology including 3D objects, reconstruction of building structures and even past landscape scenes has been for several years a standard and specific way of documentation and interpretation. However, what is currently changing is the general availability of the necessary technologies. A common feature of new software solutions and new technological equipment is their high user-friendliness, which allows high-quality outputs without deeper knowledge of the issue or prior extended training. Another new important aspect is the low acquisition price of the software and equipment as compared to the previous period; moreover, many freeware tools have been created. Last but not least, there are new platforms for easy presentation and sharing of virtual data. In our talk, we will provide an overview of options for using the new 3D technologies especially for small heritage actors.

Kwan, Daniel (University of Toronto)

[284] *An Overview of Technological Changes in the Pottery of the Early Holocene Shangshan Culture, Zhejiang Province, China*

This presentation provides a preliminary overview of the diachronic modifications that occurred in the Shangshan ceramic technological tradition (approximately 11,400 to 8,600 cal. BP). It is hypothesized that Shangshan peoples engaged in low-level cultivation of rice and began the process of bringing this crucial cereal under domestication. The authors explore the relationship between changes in Shangshan pottery technology, culinary practices, and the emergence of rice cultivation as factors in the complex human-environmental interaction that occurred in the lower Yangtze Valley after 12,000 years ago. Pottery recovered from the Shangshan, Hehuashan, Huxi, Qiaotou, Miaoshan, and Changchengli sites serves as the focal point for the macroscopic component of analysis.

[203] *The Connecticut State Archaeological Preserve Program*

In this introduction to Connecticut’s State Archaeological Preserve program, I will talk about the legislation that created it, the process for designating sites as Archaeological Preserves, and how these properties are used or managed after designation. Although the program has the explicit goal of site preservation, in practice it has spurred many additional benefits. Foremost among these additional benefits has been the forging of partnerships with the State Historic Preservation Office and inspiring stewardship for the sites so designated. While not every nominated site makes it to preserve status, just going through the process for consideration has made the value of these benefits more apparent to all involved. Nominations for archaeological preserve status have originated from a variety of concerned preservation groups, individual landowners, municipalities, state agencies, or at the request of SHPO. Many of the individuals or groups that have sought designation have not been traditional partners with SHPO’s archaeology program. More importantly, these individuals and groups have developed their own sense of stewardship over resources they cannot see, and has fostered a sense of stewardship in their communities.

[174] *Passing Through or Settling Down? Paleoindian Occupation of Colorado’s Southern Rocky Mountains, USA*

Colorado is well known for dense concentrations of Paleoindian sites found within its eastern plains and in multiple high altitude basins (Middle Park, Gunnison Basin, San Luis Valley) to the west. Prominent mountain ranges separate these clusters of sites, and the question remains, when were these mountains first crossed and/or utilized? These high altitude settings (elevations routinely topping 3000–4400 m) would have presented both challenges and opportunities for the earliest inhabitants of the region. This paper examines the occurrence and frequency of Paleoindian components within the montane, subalpine, and alpine ecosystems of the Front Range and the Medicine Bow Range of the Southern Rocky Mountains. Over 750 sites of all periods (276 prehistoric components) are recorded over an area encompassing seven 1:24,000 scale maps. While limited numbers of late Pleistocene materials are present (faunal remains, Folsom materials), these ranges are dominated by late Paleoindian occupations, found at Early Holocene Allen complex sites such as Carey Lake, Caribou Lake, Fourth of July Valley, and Rollins Pass. Archaeological data are summarized to discuss the timing of the initial occupation of these high mountains, identify the periods of most intensive Paleoindian use, and propose reasons for these early occupations.

[20] *The Dynamics of Māori Socio-political Interaction: Social Network Analyses of Obsidian Circulation in Northland Aotearoa*

The Polynesian colonists who settled New Zealand touched off the creation of a type of society not found in remote Oceania. Over the span of several centuries relatively autonomous village-based groups transformed into larger territorial hapū lineages, which later formed even larger geo-political iwi associations. A social network analysis of the spatial and temporal distribution of obsidian artefacts, an important stone resource that was used for a variety of tools, evaluates where and when new types of social forms came about in relation to diverse social and environmental contexts. Incorporating data from pXRF sourcing of obsidian artefacts and obsidian hydration dating we investigate the dynamic complexities of social interaction in Northland and gain insights into how Māori society was transformed from village-based groups to powerful hapū and iwi.

Ladron De Guevara, Sara (Sara Ladron de Guevara)**[128]** *The Eyes of God*

The deities of El Tajin seem to share a characteristic scroll eyebrow in bas reliefs as well as in mural paintings.

I will follow the representation of such an icon, trying to recognize possible origins, the outreach of the element and the symbolic associations in Mesoamerican time and space.

Laffoon, Jason (Leiden University) and William Pestle (University of Miami)**[323]** *Quantitative Paleodietary Reconstruction with Complex Foodwebs: An Isotopic Case Study from the Caribbean*

Stable isotope analysis is one of the most effective tools for paleodietary reconstruction and has been widely applied to a vast array of archaeological contexts including the Caribbean region. This region, however, possesses a particularly complex isotopic ecology, including both a large number of isotopically variable food sources and a high degree of isotopic overlap between different food groups. As such, to date, most regional paleodietary studies have been limited to descriptive and qualitative conclusions concerning the relative contributions of different food sources. In this study we apply an iterative Bayesian multi-source mixing model (FRUITS) to human stable isotope data from the prehistoric population of Tutu, St. Thomas, USVI, to generate quantitative and probabilistic individual paleodietary reconstructions. The isotope dataset includes both bone collagen ($\delta^{13}\text{C}_{\text{coll}}$ and $\delta^{15}\text{N}_{\text{coll}}$) and apatite ($\delta^{13}\text{C}_{\text{apat}}$) data. The results of two different dietary models using four and five distinct food groupings, respectively, are compared and assessed relative to other relevant archaeological evidence concerning past diet at the site. We highlight the potentials and limitations of multi-source mixing models for regional paleodietary studies, and their relevance to ongoing debates within Caribbean archaeology concerning the relative importance of different food sources such as manioc, maize, and seafood.

Lagia, Anna (Biological Anthropology, Albert-Ludwigs-University Freiburg)**[298]** *Contributing Bodies: The Foundation of the Modern Human Skeletal Collection of the University of Athens in Greece*

The capacity of humans to contribute positively even long after death includes not only donations and institutions but also one's own body. The human body and its parts provide the opportunity to bridge time in archaeological and forensic contexts and appreciate human history. In 1996–7 this capacity was aptly evaluated by the scientific committee of the Wiener Laboratory of the American School of Classical Studies in Athens and the foundation of the modern human skeletal reference collection for Greek populations was launched. Since then, a large number of contributions has led to the creation of a collection of more than 350 human skeletons at the University of Athens, known as the 'Athens Collection.' Fields of research involving the determination of sex, age, health and diet draw now directly from a collection of human remains for which these parameters are known. Today anthropology practiced in Greece and the Eastern Mediterranean has its own coordinates and sound foundations. In this presentation an appraisal is attempted of the course and dynamic of the development of this collection, known during its foundation as the 'Wiener Collection.'

Lakevold, Courtney [120] see Ives, John W.

Laluk, Nicholas (White Mountain Apache Tribe)**[114]** *Embracing the Ndee Past as the Present: Ndee Cultural Tenets as Sovereignty-Driven Practice and Community Well-Being*

In 2004 the White Mountain Apache Tribe passed a tribal resolution approving the White Mountain Apache Tribe Cultural Heritage Resources Best Management Practices (Welch et al.). These practices presented and delineated in guideline form discuss cultural heritage resource definitions; management and necessary steps before, during and after project implementation for any ground disturbing projects potentially adversely affecting cultural heritage resources on Ndee (Apache) trust lands. However, since the tribe's adoption of the practices little has been done in reference to the application of such tenets/concepts found within the guidelines to real world cultural and archaeological methods and practices. Moreover, diversity at the tribal community level during oral collaborative interviews demonstrates that tribal knowledge systems that drive such best management practices and overall sovereignty-driven research need to be considered as directly affecting how these practices might be applied at both the intra- and intertribal level. This paper suggests that such cultural precepts including respect and avoidance can be used and applied to Ndee research contexts that not only embrace such cultural tenets, but contribute to overall community well-being as well as a sense of balance, beauty and harmony known as Gozho for Western Apache communities.

Lam, WengCheong (Chinese University of Hong Kong Department of Anthropology)**[24]** *Early Globalization of the Han Empire in Its Southern Frontier and the Expansion of Iron Economic Network*

Even though the framework of early globalization has been proved as effective in illuminating ancient interregional interaction in many regions, its value and contribution to the archaeological study of ancient China has been overlooked in the literature. Focusing on the Han Empire, we employed statistical methods to exam variations in assemblages and frequencies of iron objects, one type of critical state finance in the Han political economies, from burials in the southern frontier of the Empire, including present-day Hunan, Jianxi, Fujian, Guangdong, and Guangxi. Although iron ware was commodities commonly found in the Han period, this study identified several cross-regional patterns of variation in the assemblages of iron ware from tombs, which were shaped by both local production, expansion of the imperial market network, and core-periphery relationship. By combing globalization framework and analysis of our big data, this presentation tries to shed new light on nature of integration and regional interaction of the Han Empire.

Lamb, Céline (University of Kentucky)**[142]** *Crafting, Ritual, and the Constitution of Rural Complexity: Household and Community Practices of Distinction and Affiliation at Chunhuayum, Yucatán*

As Maya archaeology has shifted away from urban-centric perspectives, recent research demonstrates that hinterland populations, like urbanites, were involved in diverse and shifting practices enabling them to build and negotiate complex relationships. Using a community approach, this paper examines non-agrarian activities practiced during the late Early and Late Classic (ca. 500–850 AD) by residents of Chunhuayum, a small yet socioeconomically diverse farming settlement located in northwest Yucatan. Through domestic assemblages and architecture, I argue that shell and chert craft production, and suprahousehold rituals, enabled three households to distinguish themselves more markedly from their neighbors while simultaneously partaking in the constitution of a local community. These activities, and their resulting relations of mutually constituting affiliation and distinction, are also related to nearby centers' faltering political clout and population decline. Reframing discussions of complexity to focus on the micro-levels of human interaction within a lower-order rural settlement, this research counters enduring assumptions about rural populations and contributes to a more inclusive and nuanced understanding of ancient Maya social complexity, in which hinterland people were diverse, active participants in local and regional historical processes.

Lamb, Henry (Aberystwyth University, UK)**[198]** *The African Humid Period: Paleolimnological and Paleoecological Evidence*

From about 15,000 to 5,000 years ago, lakes and rivers existed across now arid areas of northern Africa, accompanied by extended ranges of vegetation, animals and human settlement. In eastern Africa, lake levels were very much higher than present, with now-closed lakes overflowing into

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

the Nile and tributary rivers. While it is widely recognised that this African Humid Period resulted from an intensified African summer monsoon linked to the early Holocene precessional increase in summer insolation, its precise timing and geographical extent, especially its onset and termination, are widely debated. Vegetation feedback factors may account for differences in the rate of changes between insolation drivers and climatic response. Local factors, especially lake hydrology and morphology, undoubtedly account for differences in the timing of changes between sites. In this contribution, I will review some of the evidence for the African Humid Period, demonstrate these apparent anomalies, and attempt to clarify its temporal and geographical boundaries.

Lamb, Trevor (University of New Brunswick)

[199] *Incised Lines: Mortuary Ceramics and Their Role in Defining Protohistoric Chronologies in the Far Northeast 1900–1960*

The first half of the twentieth century saw the creation of many professional and avocational archaeological institutions in Eastern Massachusetts. These institutions were motivated to both understand the prehistory of the Northeast, and to build large museum collections for comparative and public engagement purposes. The drive to acquire largely intact objects led to the excavation of many graves throughout New England and the Maritime Provinces, but the frequent discovery of graves in Eastern Massachusetts due to urban expansion led to their heavy representation within the literature. A large body of incised ceramic vessels from grave contexts thus entered institutional collections during this period, and formed the core of what scholars and avocationalists used to define Protohistoric ceramic technology. This paper seeks to evaluate the persistence of these chronologies in the twentieth century, address later research which demonstrates the inappropriateness of applying these chronologies to much of the Far Northeast due to the contemporaneous use of cord impressed ceramics in areas of Maine and the Maritimes, and to serve as a starting point for future research concerning ceramic diversity in the Protohistoric Far Northeast.

Lambert, Shawn (University of Oklahoma)

[255] *A Provenance and Stylistic Study of Formative Caddo Vessels: Evidence for Specialized Ritual Craft Production and Long-Distance Exchange*

Instrumental Neutron Activation Analysis is used to determine whether Formative Caddo finewares (A.D. 850 -1150) were made locally in the Arkansas River Basin or produced by their Gulf Coastal Plain neighbors to the south. The preliminary INAA results, in concert with a stylistic study that indicates very few potters had the knowledge and skill to produce them, show that Formative Caddo finewares were made in the southern Caddo region and exported north to Arkansas River Basin mound centers for strictly mortuary use. These findings suggest an extensive history of specialized ritual production and long-distance exchange between two diverse Caddo communities much earlier than expected.

Lambert, Spencer (Brigham Young University)

[43] *Identifying Fremont Large Game Hunting Practices through the Modified General Utility Index and Strontium Isotope Analysis*

The analysis of faunal bones from several Fremont sites have resulted in complications when compared to the Modified General Utility Index (MGUI). In this research, I explore the processing and transportation techniques of Fremont hunters at Wolf Village by comparing skeletal frequencies to the MGUI. Then, I compare these frequencies with results of strontium isotope analysis on small artiodactyl teeth from Wolf Village to determine which species were obtained locally. I also identify the strontium baseline at Wolf Village and five other Fremont sites in order to identify evidence of trade between Fremont communities. The results of this research suggests that the MGUI does not seem appropriate for measuring the utility of animal portions by the Fremont. Reverse utility curves at several Fremont sites suggest that the Fremont were regularly bringing low utility elements back to residential sites at least part of the time. The MGUI can only consider caloric reasons for prehistoric hunters to return to habitation sites with low utility elements. Only when considering the social and economic reasons for transporting so-called low utility elements can archaeologists begin to discover the reasons behind the processing and transportation techniques of Fremont hunters.

[225] *Human Presence and Intersocietal Interactions in the Laurentians (Quebec, Canada)*

The Laurentians is a region of rolling hills, mountains and lakes occupying a strategic position in the vast hydrographic basin that drains the northern shore of the Saint Lawrence River. Archaeological fieldwork undertaken since 2015 demonstrates the integration of this landscape within interaction networks encompassing several other regions of the greater Northeast at various time periods. Ceramic remains, notably, reveal close links between Algonquians of the Laurentians and both Hurons to the west and Saint Lawrence Iroquoians to the south. Ongoing analysis of organic residues preserved in these vessels will further document how such artifacts were integrated and used in the Laurentian landscape. Artifacts associated with the Fur Trade, on the other hand, illustrate commercial relationships that bonded Algonquin and their French allies at the beginning of the 17th century. By means of documentary sources and archaeological data, this poster draws a picture of the Laurentians, a landscape on which small nomadic groups inscribed their presence, interacted, and created social memories for over 5000 years.

Lamoureux St-Hilaire, Maxime (Tulane University)

[337] *An Empirical Study of the Economy of the Classic Maya Regal Palace of La Corona, Guatemala*

This paper reports on the final results of a multi-faceted study of the northern section of the regal palace of La Corona. This study sampled (n=328) both plaster and soil in three adjacent patios and adjoining middens. The plaster samples underwent a geochemical analysis (ICP-MS), while the soil samples underwent flotation analysis which recovered macro-botanical remains and micro-artifacts. These results were then combined to traditional artifactual data derived from five middens excavated within the sampled area. The combination of these datasets reveals invaluable information about the economic activities that occurred in the regal palace during its latest phase of occupation, spanning roughly 750–850 A.D. These activities included: food preparation; the manufacture of many different lithic, ceramic, and perishable artifacts; the combustion of various materials; the preparation of pigments; the storage of perishable and durable items; and the discard of every type of artifact. The results of this NSF-funded study inform on the pragmatic dimensions of the political-economy of the ancient institution that was the La Corona Regal palace.

sobre ellos sea menor, mostraremos los casos específicos de la introducción de los tendidos eléctricos y carreteras que están en gestión o construcción recientemente en Oaxaca y que han permitido registrar y conocer algunos sitios arqueológicos que no han sido investigados.

Landau, Kristin (Alma College)

[82] *The Dynamics of State Integration: A Neighborhood Perspective from San Lucas, Copán, Honduras*

In the early 2000s, Mesoamerican archaeologists adopted the “dynamic” model of state organization, positing that political centralization strengthened and diminished over time. Such fluctuations are due primarily to the inherent tension between the institutions of kinship and kingship, and consequent struggle for power in political, economic, and religious spheres. I argue that the intermediate scale of the neighborhood is best suited for analyzing how local- and state-level power structures intermix on the ground. Neighborhoods within cities capture both the everyday life of a diversity of residents, and articulate with larger state institutions and political economy. While the dynamic model is now widely accepted, very few studies show how state actors and local people actually navigate growing and waning power levels. I model such dynamics through the lens of Collective Action Theory, which specifically addresses the role of state actors in the everyday life of local residents through the concept of infrastructural power. I provide a case study illustrating the actions of San Lucas residents and the Copán state during moments of very high and very low infrastructural power. This perspective provides a more holistic understanding of ancient state organization.

[153] *What's In a Seed?: An Experimental Archaeological Study of Elderberry (Sambucus sp.) Processing on the Pacific Northwest Coast*

Uncharred botanicals are commonly found on archaeological sites but seldom assigned interpretive significance owing to their assumed ambiguous origins. Thousands of uncharred, fragmented *Sambucus racemosa* (red elderberry) seeds have been recovered at Welqámex, a Stó:lō-Coast Salish settlement in the Upper Fraser Valley of southwestern British Columbia. In Stó:lō-Coast Salish territory and beyond, *Sambucus* was used as both a food and a medicine. Owing to the presence of cyanide-like glycosides, uncharred elderberry seeds are seemingly preserved in archaeological deposits for well over a hundred years. This poster highlights archaeological and experimental archaeological research addressing the stratigraphic and taphonomic circumstances under which unburned seeds can be linked to food-processing activities. We present the results of five experiments in which elderberry fruit was subjected to different preparation and cooking techniques.

Lane, Kevin (CONICET—Instituto de Arqueología)

[275] *When the Saints Come Marching In: Colony, Church and Change in the Andes (1480–1615)*

Spanish conquest of the Andes commenced in 1532 and, for all intents and purposes, was over by 1572. Yet, this somewhat simplifies the story. Throughout the Andean region, but especially away from the early strongholds of Spanish power, such as the towns and cities, conquest was a mixture of appropriation and negotiation. Drawing on research from the Ica Highlands (South-central Peru) and the Cordillera Negra (North-central Peru) this paper examines how Spanish religious orders initially occupied sacred indigenous sites, linking them directly to local cosmological landscapes. With time, the contradiction between an externalized (Andean—animated landscape) and an internalized (Christian—church) system of worship amid growing Spanish hegemony called for a renegotiation of this earlier *modus operandi*. In turn, this led to the abandonment of early church sites, in favor of churches in new town reducciones—imperial settlements which concentrated a declining indigenous population in more accessible areas—that led to a disconnect with the earlier Andean landscape. Nevertheless, the resulting Andean church was always syncretic, for instance, combining Christian saints with Andean deities, and local pilgrimage routes that directly evoked earlier indigenous sacred sites. Here we analyze the changing nature of this emergent syncretism.

[307] *Parting the Sea and Draining the Swamp: A Critical Review of Binary Approaches to Water Management*

Archaeology has the unique ability to observe how past societies' water systems were organized and managed. Indigenous approaches to water management in pre-colonialist societies, in both a conceptual and practical sense, often differed largely from those of their colonizers. Through three case studies, we evaluate and contrast indigenous relationships with water and those imposed by colonial powers. These case studies include the draining of lake of Texcoco by the Spanish in modern day Mexico city, modern development in Siem Reap, Cambodia, and the construction of the Aswan Dam to control the floods of the Nile river. We contend that decision making parties on water management in these contemporary cities have problematically based decisions for the organization and management of their water system on binary models of seasonality (i.e., wetlands/drylands). We find that a strict adherent to dichotomous treatments of water management may reduce the productive capacity of water management systems. A more faithful interpretation of indigenous approaches to water systems in these three cases may have led to a different outcome of improved productive capacity.

Lange, Frederick (Smithsonian Institution Department of Anthropology)

[263] *Exploring Mobility and Multi-directional Lifeways in Pre-Columbian Central America*

To paraphrase the symposium organizers, for decades changes in the pre-Columbian material culture of Central America were attributed to either migration or conquest. When I began archaeological research in Costa Rica in 1969 the endless debate was about Mesoamerican influence. Technological and iconographic linkages were frequently cited, but rarely were the mechanisms of the proposed linkages adequately defined or demonstrated archaeologically. In 2008, perhaps unduly influenced by having moved to California in 2004, I floated the concept of a “southern Mesoamerican Wedge” a la Kroeber. This wedge paralleled the Pacific coast and while the Paleo and Archaic periods were almost invisible, by the early Preclassic almost identical ceramics are found in the Soconusco, beneath downtown Managua, and in the Arenal region of Costa Rica. And, in a pattern even more complicated than was ever described for the Taki Wedge, the southern Mesoamerican Wedge is also intersected throughout Central America with river drainages that for all intent and purpose connected the Caribbean with the Pacific and low, natural “roads” or “saddles” between the volcanoes that accomplished the same objective. Investigating these complex adaptations, particularly involving groups of differing linguistic or ethnic backgrounds, requires new research designs and multi-country research.

[131] *The Southwest Journeys of Adolph F. Bandelier, Charles H. Lange, Elizabeth M. Lange, and Carroll L. Riley*

The US Southwest has attracted numerous adventurers and researchers since the mid-19th Century, including the three individuals noted in the title. Although more than 60 years passed between their respective journeys, their approaches to understanding native Southwest cultures were remarkably similar. Their work melded data and insights from ethnology, anthropology, history and historical documents, and archaeology. The later researchers could not have known when they began their journeys that telling the story of the earlier researcher would become a shared project that consumed much of their professional lives. That process took more than twice as long as the original researcher was in the field in the Southwest. This paper reviews the enduring legacies of these scholars and the circumstances that surrounded their efforts.

[254] *Gardening for Victory: War Gardens in the Ancient Andes*

During times of social and political crisis humans' most basic biological needs still need to be met: they need to eat. This means that during times of war, when state infrastructure breaks down and supply chains are threatened, people often take food security matters into their own hands. During 20th century conflicts, families ensured food security on the home front by building household gardens. Practically, the construction of war gardens resulted in decreased individual reliance on often fragile political systems and infrastructure. While this process could be viewed as isolating, families often viewed themselves as collectively contributing to the war effort by maintaining self-sufficiency. In this paper, I will look at historical examples of war gardens and victory gardens to assess how they provided an anchor of cultural continuity at the household level while at the same time altering broader demographic, economic, and political relationships. I will then use these data as a heuristic framework to consider how pre-Hispanic gardens transformed social relationships in the Peruvian Andes during times of war.

[103] *Which Way Did They Go? Using Individual-Based Models to Identify Out of Africa Hominin Dispersal Routes*

There is a broad paleoanthropological consensus that hominins left Africa multiple times during the Pleistocene, but the geographic routes through which they exited the continent remains unclear. Although the Sinai Land Bridge and the Strait of Bab-al-Mandab on the southern end of the Red Sea are commonly implicated as the likely pathways used by early humans during their expansion out of Africa, the evidence supporting each route is still much debated. Here, we identify viable pathways for hominin dispersal from the Ethiopian-Afar basin toward the Sinai using Individual-Based Modeling (IBM) and computational statistics. We computed empirical probabilities for modern hunter-gatherers to occupy habitats with variable elevations, slopes, streamflow and Net Primary Productivities to input into our IBM. Results show that hominins could have followed multiple paths during their expansion out of the Ethiopian-Afar rift basins toward the Levant, including the western littoral of the Red Sea basin. This study sheds light on the geographic areas that may have facilitated hominin dispersal out of Africa, and lends support to the notion that coastal landscapes may have served as dispersal conduits during global expansion of hominins. Furthermore, the models identify key target areas for future survey.

[43] *Raising Dogs for Meat and Sacrifice: A Comparative Study of Classic Period Sites in Oaxaca, Mexico*

The domestic dog (*Canis familiaris*) became a staple in the meat diet of Zapotec peoples during the Formative period (1500 BC—AD 200) in the Valley of Oaxaca, Mexico, and continued to be increasingly important in subsistence and ritual into the Classic and Postclassic periods. Recent zooarchaeological research has identified low-intensity household management/production of animals and animal by-products at sites throughout the valley, with each settlement marked by its own unique signature of animal use. Households within each community also showed differences, both marked and subtle, in animal-based subsistence practices, dietary preferences, and use of animals and animal by-products. Drawing on data from dog skeletal remains and ceramic dog figurines, we examine dog raising, consumption, and use at the Classic period site of Lambityeco. We compare similarities and differences among households at Lambityeco and two other contemporaneous sites (El Palmillo and the Mitla Fortress) to gain a more holistic understanding of dogs in ancient Zapotec foodways, ritual practices, and craft activities.

[39] *Chasing the Cure: The Archaeology of Alternative Health Practices at a Tuberculosis Sanatorium*

Eighty years ago, Cragmor Sanatorium in Colorado Springs, Colorado was a celebrated asylum for wealthy tuberculars and one of the premier facilities in the West. In its heyday, Cragmor housed some of the wealthiest patients in the United States. In the 1950s, the sanatorium contracted with the Bureau of Indian Affairs to treat Navajo women with tuberculosis. Once it became part of the University of Colorado system in 1965, much of the original history was subsumed under the growing campus but a few features remain. This project seeks to recover some of the ephemeral features of the sanatorium that could help us put the history in context and better understand the alternative health practices employed by both patients and doctors at the sanatorium. As part of a survey and inventory of the cultural resources of UCCS funded by the Colorado State Historic Fund, we identified and recorded several sites associated with the original functioning of the sanatorium. Using archaeological testing and historical records, we illuminate institutional practices as well as describe alternative healing strategies employed by physicians and patients at Cragmor.

[85] *Cara Blanca Pool 6: Colonial Logging and the Evolving Landscape*

Cara Blanca, in central Belize, consists of 25 pools that run east to west along the base of a limestone cliff. The Pre-Colombian significance of the pools has been studied by the Valley of Peace Archaeology Project, yet little attention has been paid to their Post-Contact influence on the local and regional landscape. This paper explores the role that Pool 6, a shallow lake centrally located in the line of lakes and cenotes, played in colonial logging operations around Cara Blanca. The 2014 exploration of Pool 6 revealed equipment used in logging, as well as historic alterations to the landscape that facilitated the movement of hardwoods from inland towards the coast. While this presentation focuses on Post-Contact logging, its theoretical emphasis is on the resilient yet malleable nature of evolving landscapes. Through a relational perspective, archaeological sites lose the label of “in the past” and, rather, reveal their ever-developing life histories. Cara Blanca Pool 6 and surrounding features exemplify how a space—a landscape—can transform while retaining the core of its essence, tying together past and present.

Larsen, Eric

[53] *“So, have you tried...?”: Is It REALLY about Science... Or Is It about Authority?*

Some archaeologists and other preservationists perceive a growing hostility in conversations about cultural heritage issues. At times it feels as though people are questioning the very foundations of archaeological work. Other times, it seems as though people just think you need to apply the technique they recently saw used on TV or the web (a la the “CSI Effect”). The implications can leave the archaeologists feeling as though the public don’t believe we know what we are doing or that they are otherwise belittling the work we do. The questions/confrontations can be quite maddening—along the lines of answering the multiple “found any gold yet?” inquiries that come up at public sites (I share with fellow archaeologists that this utterance is really a hackneyed expression of interest by the visitor). Is there something else behind the threat that many are experiencing? May we be seeing the results of a changed environment where visitors increasingly feel empowered to question the “authority” of the archaeologists? Confronting skepticism or parrying suggestions that imply we don’t know what we are doing can be difficult. This presentation will consider re-framing our responses toward further engaging interested visitors and potential supporters.

[212] *Testing the Dual Origin Dog Domestication Hypothesis*

Despite numerous investigations leveraging both genetic and archaeological evidence, the geographic origins of dogs remain unknown. On the basis of an ancient Irish dog genome and an assessment of the spatiotemporal appearance of dogs in the archaeological record, a recent paper suggested that dogs may have been domesticated independently in Eastern and Western Eurasia from distinct wolf populations. Following those independent origins, a mitochondrial assessment suggested that the Mesolithic dog population in Western Europe may have been replaced by a population from the East. To test this hypothesis, we are generating nuclear genomes of ~10 Mesolithic dogs sampled from sites in Europe and Western and Eastern Russia, and mitochondrial genomes from ~400 dogs spanning the last 15,000 years across Eurasia. The results of this analysis will reveal the phylogenetic affinities of dogs that were present across the Old World prior to the introduction of dogs associated with farming communities. This study will also allow us to pinpoint the timing of the European mitochondrial turnover and to assess whether there was a commensurate turnover at the nuclear level, thus directly addressing whether dogs were domesticated from more than one population.

[309] *Movement, Intersubjectivity, and Sensory Archaeology—Insights from Western Ireland*

Movement is fundamental to bodily perception and to the formation of the archaeological record. Histories of movement shape our perceptual apparatus and generate embodied knowledge. This recursive constitution of bodies, movements, and materials simultaneously defines the challenge and opportunity of phenomenological approaches within sensory archaeology. Explicitly or not, most researchers use their own bodily experiences of movement as analogies for making inferences about the material and sensory consequences of bodily movements in the past. As imitative learning produces shared embodied knowledge among craftspeople, likewise, archaeologists can engage with movements and materials to produce some degree of intersubjectivity with bodies in the past. Drawing from archaeological and ethnographic fieldwork in western Ireland, this paper will propose simple guiding premises for undertaking a sensory archaeology of movement. To illustrate these premises, I discuss the changing material settings and practices of Irish pilgrimage and pastoralism between the medieval and modern period. I contend that interdisciplinary, collaborative research can play a vital role in refining phenomenological research by placing researchers’ subjective experiences in dialogue with descent communities, communities of practice, and relevant historical texts and imagery.

Laszcza, Aleksandra (University of Warsaw)

[17] *Pre-Columbian Textiles from Castillo de Huarmey: Fabric Structures and Iconographic Motifs as Indicators of Cultural Influences*

Castillo de Huarmey on the north coast of Peru is an archaeological site of pre-Hispanic Middle Horizon period (AD 600–900), widely known for the discovery of the first undisturbed Wari royal mausoleum. From 2012–2013 remains of fifty-eight elite female individuals were found accompanied by rich ceremonial offerings and grave goods, including textiles. The state of preservation and the condition of a large portion of the fabrics are poor, especially those coming from the primary burial contexts. However, technological analyses revealed the unique character of the textile collection, which utilized multiple and complex weaving techniques. These techniques were applied by highly skilled weavers to create sophisticated iconographic motifs, and even though there are only a few decorated and completely preserved textiles, analyses of smaller fragments enabled the reconstruction of complete patterns. Comparison with fabrics discovered at the Castillo de Huarmey site before the first systematic excavations, as well as with motifs known from other archaeological contexts and collections, suggests strong cultural influences from the central and southern part of Peru.

[105] *PeoPLE 3K: Understanding the Population Dynamics of the Americas in the Context of Regional and Global Environmental Change*

From the civilizations in Easter Island to the Mayas or to the collapse of the prehistoric populations in the Great Basin, researchers have proposed a wide range of hypotheses to disentangle the causes and drivers behind such pronounced demographic change. PeoPLE (PaleoClimate and the PeoPLing of the Earth) 3K is a new working group recently created by Past Global Changes (PAGES) to examine in detail how environmental change over the last 3000 years has affected, either by facilitating population expansions or by promoting civilization collapse, past human demographic change. Our approach is to use a Socio-Ecological Systems (SES) approach to facilitate integration of population structural change (based on summed probability distribution curves created from archaeological databases) and past climate change impacts on the environment. Our approach further uses models developed by population ecologists to propose a new understanding of how climate and human population size interact through resource utilization over time. We illustrate these ideas with examples of population change and collapse from the high Andes, the Atacama Desert, the Great Basin and Easter Island.

[328] *The Abbott Farm National Historic Landmark: A Look into the Future*

When the Abbott Farm site was listed as a National Historic Landmark in 1976, it had already been well-known for a hundred years as a significant archaeological site. Now over 40 years later, the Abbott Farm continues to baffle archaeological scholars as to the precise meaning of its importance to prehistoric and historic native peoples of the region. Past research, present trends, and future analysis are discussed providing a myriad of evidence showing that this site continues to provide and yield information important to the prehistory of the Middle Atlantic region. Specific topics to be addressed in this presentation include the future role of NAGPRA in relation to the Abbott Farm site; the usefulness of semi-destructive and non-destructive analysis on artifacts; and the role that the study of trade and exchange and mortuary practices plays in our understanding of social complexity and connected landscapes within the Middle Atlantic region and beyond.

[333] *Tello and Carrión Cachot on Recuay Culture: A Visual Archaeology*

While the achievements of the great Peruvianist Julio C. Tello and his theories about Andean civilisation are well-chronicled, much less work has addressed his engagements with archaeological illustration, its practices and desires, especially beyond his signature Chavín work. This paper examines the imagery and arguments of key publications by Tello and his student and intellectual disciple, Rebeca Carrión Cachot, on the Recuay culture (ca AD 100–700). Together, they discerned the culture's fundamental diagnostics: pottery, architecture, stone sculpture and ritual practices associated with ancestor-fertility cult. Both employed these elements to epitomise archaeological styles and compartmentalise cultural regions, at the same time that they were positioned as units in broad comparative thinking (e.g., religion, complexity, diffusion, cosmology). The paper contends that their Recuay findings emerged largely out of collections work, ethnohistory and close analysis of objects and 'artworks'. Notably, field archaeology had little to do with their intellectual legacy on Recuay; rather it was won through ambitious visual arguments and analogies, and expressed most saliently by their use of illustrations in a 'visual archaeology.'

[238] *Reconstructing Land-Use Histories in Ecologically Transitional Mesopotamian Landscapes*

This poster presents results of the Sirwan (Upper Diyala) Regional Project's (Kurdish Region, Iraq) 2017 offsite research in the Kurdish Region of Iraq. Off-site investigations of Mesopotamian landscapes provide evidence of land-use practices and inform our understanding of strategies and structures of past agro-economic systems. Thus, the aim of the 2017 season was to employ multiple remote sensing technologies (including magnetic gradiometry and drone-based imaging) to prospect for and associate land-use features with single-period archaeological sites in varying ecological zones. Remotely sensed evidence for synchronic and/or diachronic variation in land-use practices within the study region may provide insight into unique and varying management practices necessary in transitional ecological zones.

[186] *Elko Litter: Analyses of an Elko Series Point Manufacturing Site in Central Nevada*

While Great Basin archaeologists use projectile points as time-sensitive markers, these typologies are based on the morphological characteristics of the finished artifacts. In most cases, points were produced elsewhere and curated to their final destination or they are found within a palimpsest containing a mixed bag of flaked stone tools and debitage. Seldom are archaeologists able to analyze debitage specific to the production of points. In 2016, Logan Simpson archaeologists recorded a small lithic scatter containing over 30 broken projectile points, 20 biface fragments, and thousands of flakes within a 30-by-30-meter area in central Nevada northeast of Monitor Valley. The site appears to be a spatially and temporally discrete Middle Archaic Elko series point retooling locus. As such, it provides a unique opportunity to analyze the debitage produced during the Elko manufacturing process and the spatial distribution of artifacts at this type of site. It is also presumed that the points were produced by the same individual or individuals and discarded at the same time. Therefore, an analysis to identify the morphological variability or continuity within the Elko series point type at a given point in time can also be performed.

Lavin, Lucianne (Institute for American Indian Studies)

[203] *The Venture Smith Site: An Eighteenth-Century African American Homestead in Haddam, Connecticut*

The Venture Smith homestead is an important eighteenth-century rural black archaeological site with a remarkable level of integrity, associated with a person significant to American history. Born about 1729, Broteer Furro was an African prince abducted and sold into slavery when only six years old. Thirty years a slave, he purchased his and his family's freedom and became a prosperous mariner-merchant-farmer and benefactor to fellow blacks. At his death in 1805, he owned over 100 acres of farmland, three houses, outbuildings, a wharf, and numerous watercraft. Respected by white neighbors/associates to whom he was known as Venture Smith, he became a local folk hero. Historical documents speak of his integrity, courage and strength. Smith's life story is critically important to the study of slavery in New England, to African-American history, and to American cultural heritage. He is the focus of ongoing research across several continents. The BBC produced a film on his life: *A Slave's Story* (2007). For reasons to be discussed, though not formally a State Archaeological Preserve, the Venture Smith site warrants consideration as a National Historic Landmark.

Law, Karly

[338] *Student Safety and Experience in Archaeology: Building a Diverse Future*

When people of color pursue college educations, safety is often a priority. Colleges and their respective departments, become their home, faculty become mentors, and their fellow students become their family. An enormous amount of trust is placed in our departments and we are often left feeling alone. As graduate students and Teaching Assistant's, we are required to receive orientation and training that address procedures within federal and institutional guidelines yet we receive no orientation to help us navigate abusive behavior, and consequently are placed in situations by those mandated to teach and mentor us, exposing us to harm and leaving us feeling powerless in both the classroom and the field. In archaeology, women

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

and other non-cisgender students are at greater risk than their counterparts.

The Society for American Archaeology's 2017 statement on Sexual Harassment and Violence, formally recognizes that "intimidation...has been legally recognized as having a chilling effect on learning and workplace experiences..." This experience is further undermined by occurrences of discrimination, harassment, and differential treatment in the classroom, lab, and the field. It is imperative that we lobby for training, education, and resources.

Law Pezzarossi, Heather (Syracuse University)

[272] *Being 'Post-Indian' in 19th Century New England*

In the decades following the American Revolution, Native people throughout Southern New England took part in the development of a Native basket industry specifically targeted for settler consumption. Scholars have long acknowledged that basket styles communicated tribal and even familial affiliation among basketmakers and Native community members. But for customers, the objects represented a connection with a Native artisan who filled the role of the "Vanishing Indian," an emerging trope in popular culture and politics in the early decades of the Republic. Vizenor reminds us that his concept of the "post-indian" condition is often a study in the "simulation of absence," in which the absence of "ontologically "real" persons that conform to the stereotype of Indians circulating in the hegemonic US culture, Native American people simulate those images (Vizenor and Lee 2003: 161), the "post-indian" being a subject willing to engage with and push the accepted boundaries of a stereotypical Indian identity (Vizenor and Lee 2003). In this paper, I'll take a closer look at basketmakers' engagement and adept manipulation of developing colonial tropes of Indianess in light of Vizenor's ideas about what it means to be "post-indian".

Lawhon, Taylor (University of Alabama) and David Mixter (Binghamton University)

[147] *To Love and to Leave or to Never Have Loved at All?: Abandonment Deposits within the Late Classic Maya Palace at Actuncan, Belize*

In 2012, excavations were conducted within a Late Classic noble palace at the ancient Maya site of Actuncan, located in western Belize. Remains of a large deposit of Terminal Classic materials were recovered from a corner of the palace's primary courtyard. Based on its location on the courtyard surface and below collapse, the deposit was assumed to date to the period of the palace's abandonment. The placement of this deposit was contemporary with Actuncan's 9th-century renaissance as a post-royal capital after centuries of incorporation into polities ruled by kings located at nearby Classic period centers. Mixter and colleagues have argued that Actuncan's palace served as a noble's residence during the Classic period and was terminated during the Terminal Classic because of its symbolic association with external forces that had previously dominated the site. Drawing on new ceramic analysis, this paper looks in detail at the contents and context of the deposit to reassess the significance of the abandoned palace to Actuncan's thriving Terminal Classic community.

Lawler, Brooks (University of Alaska Fairbanks)

[250] *Clarifying Perceptions of Rock: Prehistoric Use of Common Toolstone in Tangle Lakes, Alaska*

Archaeologists have had difficulty agreeing upon uniform designations of certain kinds of toolstone that are not easily distinguishable visually. There are occasions when the archaeological definition of toolstone material and the geological definition of the same toolstone material do not match. A situation where this discrepancy might arise is when archaeologists give a more specific name to a cryptocrystalline silicate that is difficult to identify based on visual analysis. An understanding of the geological definition and geochemistry of toolstone can allow archaeologist to ask more specific questions about toolstone provenance, procurement, and use. The toolstone variability among sites in the Tangle Lakes Region is not well understood, and is thought to belong to two local quarries. This project seeks to understand the geochemical composition of two cryptocrystalline silicate toolstone quarries and visually similar artifacts from specific activity areas from three sites in the region at varying distances from the quarries. The toolstone variability will be defined by geochemical groupings using XRF and pXRF analysis. Future analysis will attempt to geochemically match the artifacts with the two quarries, and learn if there is more variation in the material than can be accounted for by the two quarries.

[95] *Petrography, Production, and Provenance of Ceramics from La Blanca, Guatemala*

The Middle Preclassic (900–600 BCE) was a critical time of political and social centralization in the Guatemalan lowlands. Of particular interest is La Blanca, one of the first polities to rise and show signs of regional influence and potential urbanization. To reconstruct everyday life I am using excavated ceramic refuse to observe dynamics surrounding three households. This, in turn, elucidates elements of La Blanca's political economy associated with the manufacturing and production of ceramics. To observe this I am adapting Dickinson's methods of mapping interaction spheres using petrography to a household level. Reviews of local geologic sources and 90 sherds have been collected. Petrographic examination of sherds has shown three distinct compositional groups: Mineralic, Volcanic, and Vitric. From these groups, representative samples have been selected and point counted using the Gazzi-Dickinson method. To correlate sherd samples to potential sources, three modern sands were sampled and seven Paleo sands from the Missouri University Research Reactor were provided. These samples were analyzed using the same methods as the sherds. Preliminary results indicate a local geologic provenance for raw materials and varied clay sources and manufacturing techniques among households. This suggests that each household was producing their own ceramics and trading amongst themselves.

[205] *Chiasin (The Big Rock): Mementos of Identity*

The story of Chesaning begins long before the first historic documents; the village's name originating from a massive stone pushed from Ontario by glaciers. This memento, known as the Big Rock, or "Chiasin" in the Anishinabe language was and continues to be an unmistakable feature on the landscape. According to pioneer histories, Chiasin was a place of prehistoric corn feasts and ceremonies. However, when visited in 1837, one such source reports a haunting lack of people. Where had the people of Chesaning gone?

Today the Big Rock lies adjacent to a schoolyard- accessible to the public, though without any accompanying narrative of explanation. Many children go through Chesaning's schools without discovering the Native American history around them. Why are some aspects of Chiasin's history remembered and others forgotten? Is the geological anomaly in the schoolyard the true Big Rock? The author will review archaeological and historical information

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

from between the years 1600 and 1860 regarding the Chesaning area to shed light on these mysteries and to educate the public. Educational programming, interpretive signs, and the establishment of a Chesaning Historic Preservation Commission in coordination with the Chesaning Historical Society, Chesaning Township, and the Village of Chesaning are proposed.

[134] *Cavetuns: Unexplored Theoretical Implications of a Discovery at Mul Ch'en Witz, La Milpa, Belize*

In June of 2017, the Contested Caves Archaeological Project (CCAP), explored what was thought to be a partially capped chultun at the site of La Milpa, Belize. On entering, however, it became clear that the feature was actually a small, natural cave with a classic chultun-style entrance carved into it. Two of the cave's three chambers contained small pools of water, which receded into the porous limestone, within days of their discovery. The pools make any possibility of storage infeasible particularly during the rainy season. Over the subterranean feature, the Maya constructed a rubble cored platform, identical to a platform constructed over another chultun at La Milpa. The cave—water association of this cavetun forces a consideration of the feature in terms of ancient Maya sacred landscape. The discovery of a hybrid cave-chultun further establishes a link between the two types of subterranean space.

[54] *A Long Walk from Town: Early 19th Century Landuse in the Territory of Bova*

In the early 1800s the majority of Bova's citizens live in their hilltop town while holding small plots of land in multiple locations, some quite a distance from the town itself. Archival records from notaries, diaries, and cadastral holdings paint a picture of an independent community of low income citizens plying their trades and rather detached from the larger economic systems around them. Despite the abundance of natural resources available in the landscape, the community was not fully integrated into the larger economic system of the region, other areas of the Italian peninsula, or the larger Mediterranean world. This poster explores the relationship between an individual's multiple landholdings and where within the landscape this land was located.

[180] *Rock Art in the High Rock Country: A Contextual View*

Prehistoric rock art increasingly is understood to be embedded in complex cultural systems of social routines, kin networks, economic landscapes, technological change, seasonal population movements, domestic and task-specific foraging behaviors, and variable gendered activities. The Holocene record of occupation and use of the High Rock Country in the Northern Great Basin provides an opportunity to explore such complex contexts of rock art. Rich lithic sources, strategic locations for hunting, and abundant gathering landscapes in the region are marked by substantial rock features, including petroglyphs and, more rare, pictographs. Focusing on a long history of research at the Massacre Lakes, Serendipity Shelter, and elsewhere in the High Rock Country, I examine rock art features in their ecological settings and their co-occurrence with associated milling equipment and obsidian from a wide range of volcanic sources. With these multivariate sources of information, a picture of shifting landscapes, social networks and gendered activities emerges to inform the context and function of rock art in the Northern Great Basin.

[294] *Minimally-Invasive Geoarchaeological Investigation of a Sub-marsh and Intertidal Precontact Site in New Hampshire*

Many precontact archaeological sites in New England exhibit poor preservation of organic materials but they occupy relatively stable upland landforms. Conversely, intertidal and submerged sites often contain exceptional organic preservation but exist in or near high-energy and erosive environments. This paper describes minimally-invasive geoarchaeological investigations of an Archaic to Terminal Archaic site in New Hampshire that is buried by salt marsh peat, exposed at a rapidly-eroding shoreline, and discontinuously preserved in a dynamic intertidal zone. Two years of intertidal UAV mapping and digital photogrammetry have generated sub-centimeter digital elevation models and allowed very high resolution assessments of shoreline retreat and sediment mobilization. Recordation of exposed stratigraphic profiles is elucidating the multi-component stratigraphy and complex post-occupation submergence and salt marsh development. Coring the marsh and GPR experiments focus on paleogeographic reconstruction of pre-submergence upland landscapes. Other research areas include radiocarbon dating of occupation horizons and timing of submergence, macrobotanical analyses to identify depositional environments, and foraminifera sampling to constrain paleo-tidal levels. The main goal is to understand the timing and nature of submergence as part of a larger effort to model the preservation potential and location of other sub-marsh, intertidal, and submerged sites in the region.

[204] *Preliminary Results of Material Culture from the Historic First Baptist Church Cemetery, Philadelphia (ca. 1700–1860) and Analytical Problems Arising from Stressed Excavations and the Lack of Formal Legal Oversight*

The material culture found in association with the skeletal remains recovered from the historic First Baptist Church of Philadelphia cemetery, which was in use from 1700–1860, provides a valuable glimpse into colonial and post-colonial burial practices in one of early America's most important cities. The interior material culture in the form of burial goods is most often minimalistic with few exceptions while the exterior material culture (i.e. coffin hardware) assists in relative dates while highlighting stylistic trends of the day. As one of the largest known collections of 18th and 19th century coffins yet unearthed in historic Philadelphia, the assemblage offers invaluable data on mortuary behavior of some of America's first citizens and immigrants. However, the difficulty in excavation, due to the lack of site access, time, and legal concerns created problems that are still felt in post-excavation analysis.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

LeBlanc, Megan**[224]** *The Hydrologic and Geologic Dynamics of the Las Peñas Spring*

This presentation addresses the hydrology of agricultural terraces and a spring associated with the Late Intermediate Period (post AD 1200) site of Las Peñas located in the Moquegua Valley of Peru. Positioned 150 meters northwest of Las Peñas, the spring is located at roughly 2,700 meters in elevation and sits at the base of several agricultural terraces. This field system was presumably in production at the time Las Peñas was occupied and is still in use today. Using coring techniques, sediment samples, GPR data, and aerial photography, I examined the hydrologic and geologic dynamics of the landscape to understand their potential relationship to the people who occupied Las Peñas. These data were analyzed in combination with sediment samples from the site of Cerro X, an unexcavated potential Middle Horizon reservoir, to put the Las Peñas spring in the broader context of the Moquegua Valley. Small spring systems can teach archaeologists about water storage in arid, highland conditions. It can also provide unique insight on the ancient and modern hydrology of sloped agricultural terraces. Springs at the base of agricultural terraces provide fresh water resources for humans and their animals in an area where water is sparse.

LeCount, Lisa (University of Alabama)**[129]** *Examining the Institutionalization and Transformation of Maya Kingship at Actuncan, Belize using Collective Action Theory*

Here, I summarize the major research questions and results from the Actuncan Archaeological Project, which has been on-going since 2001. The project was initially designed to examine the ways Preclassic Maya leaders institutionalized political authority from the perspective of household archaeology, but has expanded to include excavation of civic architecture and remote sensing in open spaces. My research is informed by collective action theory, and the degree to which leaders engaged in exclusionary and inclusive practices over the site's 2000 years of occupation. Findings have not supported my original exclusive power hypothesis in which early rulers circumvented kin-based authority by out-competing and fragmenting established households. Instead, the small number of founding elite and commoner houses enjoyed socio-economic prosperity during the Terminal Preclassic period when kingship was institutionalized. The rise to regional authority was rapid at Actuncan, which was built by burying an earlier settlement and greatly expanding civic structures. This expansion was achieved through inclusive practices that mobilized hinterland populations' labor and loyalties. Later, Classic-period elites experienced boom-and-bust cycles of growth and abandonment, which I argue is the result of elite competition for exclusive power. Evidence supporting these ideas is presented by contributors to this symposium.

Ledford, Kelly (Florida State University)**[102]** *Let Them Eat Corn: Using Stable Isotopes to Explore Turkey Management in the Mississippian Period Southeast*

The eastern wild turkey (*Meleagris gallopavo sylvestris*) is a well-documented resource for Native Americans in the Southeastern United States. Recent research suggests that turkeys may have been managed by Mississippian period people in Middle Tennessee as opposed to being hunted solely in the wild. These conclusions are based on a combination of ethnographic sources, osteometric data, and other non-osseous evidence. As a part of my thesis, I extracted collagen from 12 prehistoric turkey specimens in Middle Tennessee to determine if their isotopic signatures reflect that of a wild diet comprised of grasses and shrubs, or if their signatures indicate their diet was supplemented with agricultural products like maize. I compare the isotope results from this analysis to other research from the Southwestern United States and Mesoamerica where evidence for the domestication of turkeys alongside maize agriculture by prehistoric people is well documented. This research is the first to apply stable isotope analysis to ancient turkey remains in the region. Our understanding of human-turkey relationships in the region is lacking and this study aims to provide a more holistic interpretation of the complex human-environmental relationships of the Mississippian period in the Southeast.

Lee, Craig (Metcalf Archaeological Consultants & INSTAAR), Pei-Lin Yu (Boise State University), Edward Jolie (Mercyhurst University), Kathy Puseman (Paleosciapes Archaeobotanical Services Team) and Halcyon LaPoint (Custer-Gallatin National Forest)**[48]** *Beyond the Points: Sociocultural Complexity Revealed by Non-hunting Artifacts from Melting Ice Patches in the High Alpine, Greater Yellowstone Area, USA*

The recovery of chipped stone projectile points, bows, dart and arrow foreshafts and shafts, and the remains of prey species—notably bighorn sheep (*Ovis canadensis*)—in direct association with melting Greater Yellowstone Area (GYA) ice patches illustrates that hunting was a primary activity for Native Americans at these features. The recovery of other, non-hunting related, types of organic artifacts at ice patches suggests a broader utilization of the alpine environment. Although fewer in number, these artifacts bolster the contention that the alpine archaeological record reflects repeated occupations by family units—or still larger groups—taking advantage of a seasonally enriched biome. Artifacts that will be discussed include cordage made from hair (undated), a ca. 1375 cal BP twisted object made of wapiti (*Cervus elephus*) hide, several wood objects of uncertain function ranging in age between ca. 6200 cal BP and 1370 cal BP, and a ca. 1340 cal BP basket/tray made of willow (*Salix* sp.). In concert with a growing appreciation for the robust, increasingly well-documented chipped stone record from non-ice patch areas within the GYA alpine, the non-hunting artifacts recovered at ice patches provide an important avenue for understanding how Native peoples integrated with these ecosystems.

Lee, Samantha (The University of Maryland)**[308]** *Trading In Children*

A decade of archaeology at Wye House Plantation in Maryland has yielded a multitude of information regarding the institution of slavery and the experiences of enslaved individuals. Whether or not enslaved peoples were deliberately bred systematically to produce children for sale by the master is a topic that has been generally neglected in modern scholarship. This practice demonstrates the inherent inhumanity of slavery and is an example of what the scholar Orlando Patterson describes as “the gendered nature of slavery.” Women and children were often the most exploited as a result of

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

their sexuality, a practice that has continued today in the modern era. The Works Progress Administration's Slave Narratives present multiple firsthand accounts of the prevalence of this abhorrent practice in the United States. There is reason to believe that there may have been a breeding plantation among the properties of the Lloyd family, the owners of Wye House Plantation. This paper will focus on the gendered nature of slavery, the custom of slave breeding, and the possibility of a breeding plantation among the properties of the Lloyd family.

[171] *The Metallurgical Cycle and Human Responses to Material Fatigue*

Innovations in metallurgy had and continue to have significant and transformative effects on society. From mineral exploration and mining to primary metal production, manufacturing, and consumption across a range of social contexts, metallurgy influenced a wide range of distinctly human conditions. However, while metals are particularly transmutable, they also rapidly corrode back into increasingly stable mineral compounds in processes that people tried to mitigate and often unsuccessfully overcame. This paper discusses how metal production and consumption leads to this poorly studied phenomenon of material fatigue, where metals embrittle, corrode and ultimately fail, giving way to potentially systematic societal and environmental upheaval with oftentimes unpredictable and disastrous effects. Using ancient and modern case studies, this paper will then examine the human response to overcome the problems of material fatigue. In particular, we examine the case of the 1200 BC Cape Gelidonya Shipwreck found off the coast of southwestern Turkey, and whose cargo of copper ingot and alloy scrap metal demonstrates how some sectors of society worked alongside consumers to recycle fatigued metal. Examination of this metallurgical cycle—from minerals to metals and back again—affords a new perspective on the role of metal technology in human societies.

[176] *The Production and Exchange of Perishable Goods at Salinas de los Nueve Cerros and Atop the Coban Plateau*

Investigations at Cancuen, Sebol, Salinas de los Nueve Cerros, and other sites at the base of the Guatemalan highlands since the late 1990s have shown the importance of the region for importing and refining a variety of highland goods for the lowland market. While most of the emphasis has been placed on the goods for which there is direct evidence of production and exchange—obsidian, jade, iron pyrite, and other lithic commodities present in abundance at these and other sites—Demarest, Dillon, and other scholars have posited that these sites were also important nodes of exchange for perishable goods that are harder to find in the archaeological record.

This presentation will focus on two of these perishable commodities—salt and quetzal feathers, both of which have ample ethnohistoric descriptions of their production during and after the Spanish conquest, and both of which are common in Classic Maya lowland iconography. The authors will discuss production techniques, their importance in the lowland economy, and Precolumbian evidence for their production and exchange.

Leines, Madeline

[43] *Perceptions vs. Reality: Animal Lives in the Ancient Maya, Aztec, and Inca Cultures*

Past and present human-animal relationships have always been shaped by culturally-based beliefs, perceptions, and treatment of nonhuman animals, which in turn influence the lives of the animals in their environments. That being said, how accurate were ancient cultures in their attempts to understand animals, and how did subsequent human perceptions influence animal realities? What might it have been like as a nonhuman animal living near ancient peoples, based on biology and culture? What of the animals in Central and South America, for instance? This research provides an interdisciplinary, anthrozoological study of animal lives in the ancient Maya, Aztec, and Inca cultures. After a brief introduction to the cultures and species present among them, this paper delves deeper into an analysis of four animals (felines, deer, snakes, and canines) and their potential, culturally influenced realities. A comparison of these interspecies relationships reveals a cultural continuum based on ideological and practical proximity to nature, creating a framework for future studies of ancient, as well as present, human-animal interactions.

Lemke, Ashley (University of Texas at Arlington)

[244] *Anthropology Underwater: Landscape Archaeology above and below Water in the Great Lakes*

Submerged prehistoric landscapes have unique traits which make them invaluable to archaeologists—increased preservation of organic remains, Pompeii-like snap shots in time, and data that either do not exist on land or are deeply buried. These attributes make the few challenges that remain for conducting archaeology underwater more than worth the effort. Early human occupation in the Great Lakes has been difficult to investigate as acidic soils and dynamic water levels left many archaeological remains either poorly preserved or submerged. Ongoing underwater research in Lake Huron is beginning to fill gaps in our knowledge of early hunter-gatherers in this region, and provides unique data of caribou hunting 9,000 years ago using stone built hunting structures. Microregional investigations across this preserved submerged landscape have generated testable hypotheses for the location and nature of contemporary sites on land. Preliminary terrestrial research supports these hypotheses. Rather than separating archaeological research at the water line—connecting terrestrial and underwater records is a holistic approach for reconstructing prehistoric environments and forager adaptations. Anthropological archaeology underwater provides a theoretical framework for such a landscape approach to prehistoric occupations in the Great Lakes and elsewhere.

Lemoine, Ximena (Washington University in St. Louis)

[336] *Neolithic Pigs and People along China's Fertile Arc: Regional Expression and Domestication*

The foothills of mountain chains along river catchments, or "Hilly Flanks", have repeatedly been shown to be key to understanding the origins of agriculture throughout Eurasia. During the Neolithic, sites in the northern part of China's Fertile Arc (see Ren et al. 2016)—showing the earliest evidence of the cultivation of Chinese Millets—are situated along China's own "Hilly Flanks". In contrast, southern sites along the Arc cultivating rice, are located in a diverse array of landforms including piedmont plains and intermountain basins. Whereas the relationship between people, landscape,

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

and the crops has seen significant academic study, the human-animal component has yet to be explored in detail. The pig is China's earliest endemic domesticate, and may have been domesticated multiple times in this region. Through demographic reconstruction and stable isotopic analysis of pig populations from early Neolithic sites from the northern and southern parts of the Arc, belonging to the Xinglongwa 兴隆洼 culture in Inner Mongolia—representing the northern part of the Arc—and Jiahu 贾湖 from the Huai River Valley in Henan—representing the southern region, this paper intends to understand how landscape and local contexts shaped human-pig relationships and trajectories of domestication and management during this critical period in Chinese prehistory.

Lemonnier, Eva and Charlotte Arnaud (CNRS-Paris 1 panthéon Sorbonne)

[142] *Defining Rurality at La Joyanca and Naachtun (Guatemala): Land Use, Architecture and Social Dynamics*

Based on the study of two Classic Maya Lowland sites, La Joyanca and Naachtun (Guatemala), this paper explores the topic of rurality through the parameters of potential land use, visible architectural variation, and plausible population mobility. La Joyanca was a medium-sized settlement surrounded by villages and hamlets all of which were recorded by means of conventional surface mapping, whereas Naachtun was a regional capital located amidst extended communities linked by causeways that have been identified through recent LIDAR survey. Paleoenvironmental information on land use is available in both cases. We aim at assessing ancient 'heartland' and 'hinterland communities', and their relationships, as an attempt at furthering the implied concepts. Relevancy of rural and urban categories is discussed.

[76] *Agriculture, Land Management and Expressions of Elite Control at the Ancient Maya City of Tikal*

While it seems evident that the elites and royal personages at Tikal influenced at least some aspects of day-to-day activities of the Maya inhabitants, it has not been clear how this influence became manifest, particularly in regard to agriculture and other aspects of land management decisions. Recent paleoethnobotanical and archaeological studies at Tikal, however, bring some insight to this cultural black box. Three examples from the paleoethnobotanical record provide empirical evidence that indicate how the Maya elite managed their forests, set aside certain tracts of land for special agricultural projects and constructed an irrigation system to reduce the vagaries of rainfall-dependent agriculture. The first example relates to the enormous beams of sapodilla (*Manilkara zapota*) wood that were used to construct Temples 1–4 and only could have come from old growth forests, likely in a protected context, as in a pak'-al. The second example is the Inscriptions reservoir, which was not a reservoir at all, but more likely a rejollada where specialty crops, such as cacao (*Theobroma cacao*) could have been cultivated. The third example is the Perdido reservoir that received drainage water from the Lost World plaza for subsequent use in irrigated maize (*Zea mays*) agriculture.

[268] *DoD Legacy Data: Leveraging GIS and the Web for Success*

While facility-wide cultural resource management at large DoD installations has increasingly been managed with GIS, many organizations have legacy information in the form of hard copy reports and non-searchable site files. In order to successfully fulfill legal and ethical responsibilities as long-term stewards of cultural resources on these installations, it is imperative that DoD staff make the incorporation of these legacy records into their enterprise GIS management framework a priority.

For Edwards Air Force Base, HDR designed and deployed a web-based SQL server application to facilitate the document analysis and data entry from multiple archeologists into the established DoD cultural resources GIS schema. The application was developed to handle basic conflict resolution among data entries and facilitated streamlined QC reviews. The SQL application and web interface were designed to utilize a primary spatial table and secondary non-spatial tables. This allowed for additional contextual information to be added for historic properties, allowing for improved review process and research design capacity. In total HDR performed digital curation of over 4,800 site records on EAFB into an ESRI geodatabase file that is fully compatible with the installation's enterprise GIS, and contributed significantly to the long-term management of cultural resources on the installation.

[130] *Citizen Science Archaeology at Bodie State Historic Park*

Bodie State Historic Park is located in the western Great Basin, near the California and Nevada border and encompasses a 2,900-acre historical landscape comprised of buildings, archaeological sites, and features related to 80 years of Gold Rush era mining. Cultural and natural resources at Bodie are at risk of being lost due to wildfires, earthquakes, and lack of funding. Discussing the application of digital heritage methods in the Bodie 3D Project, this paper focuses on community-engaged preservation initiatives that will test the efficacy of archaeological citizen science. The project aims to engage local communities and the visiting public in recording archaeological resources through training and crowd-sourced field activities. UC Merced scholars and California State Parks cultural resources specialists collaborate on research data dissemination and outreach through mobile apps, Augmented Reality techniques, and digital documentation technologies. We hope that active involvement will lead to the public's appreciation of the park's valuable resources and foster a true sense of stewardship and preservation.

[175] *IRANGKOR Project: Production, Trade and Consumption of Iron in the Khmer Empire, Cambodia (9th to 15th c. CE)*

Investigation into material production and distribution is an important way of understanding the political and socioeconomic organization of premodern states. Iron, with its specific technological characteristics and diverse cultural utility, can be perceived as one of the most dynamic materials for facilitating social and cultural transformation. Reconstructing how iron was managed in the Khmer Empire is therefore a critical perspective for documenting the interrelationship between its multiple sociotechnical systems and greater historic trajectory. This paper discusses the combined results of technological, chronological and sourcing analyses of iron to generate a holistic view of Angkor's iron economy. This investigation was paired with extensive analyses of the vast iron production landscape of central Cambodia (INDAP project) and evidence from northeast Thailand. The focus will be on the issue of provenance to determine the origin of the production sites and how iron was incorporated into the broader exchange system. Combining multiple types of analyses enables us to identify changes in the production and consumption strategies of the Khmer state and how they translated into broader impacts felt across the empire.

[294] *Lithic Analyses of Site 21–85, an Archaic–Woodland Period Site near Robbins Swamp and the Housatonic River, Connecticut*

Site 21–85 is a large, multi-component site, with Archaic and Woodland period remnants, located adjacent to the Hollenbeck River, a major tributary of the Housatonic River, and Robbins Swamp, the largest freshwater swamp in Connecticut. The location of Site 21–85 would have afforded past peoples access to the fauna and flora associated with Robbins Swamp, travel routes north and south through the Housatonic River Valley, and fresh water from the adjacent Hollenbeck River. The site is also located less than a mile upstream from the Great Falls, an important landmark along the Housatonic River. A portion of the site was threatened by a construction access road as part of a railroad project initiated by the Connecticut Department of Transportation; the impacts to the site were mitigated by a data recovery project, as required under state and federal laws. Excavations at the site revealed 17 cultural features, Middle Woodland pottery sherds, Middle and Late Archaic period diagnostic projectile points, as well as over 4,500 lithic artifacts. Here, we present the results of the lithic analysis of this data set, and frame the repeated occupation of this site within its broader ecological and cultural context.

Leslie, Katie (VCP St. Louis) and Melissa Frederick (VCP St. Louis)

[326] *Veteran Archivists: The Harry S. Truman Reservoir Project*

The Saint Louis laboratory of the Veterans Curation Program processes several archival investigations throughout each five month term, but few have been to the scale of the Harry S. Truman Reservoir Project. This project produced 23 boxes worth of documentation spanning over 268 linear inches. The Harry S. Truman Reservoir is the largest man-made lake in Missouri and covers over 100,000 acres of government owned and flood easement lands. To prepare for the construction of the dam, a number of contractors documented over 2,300 archaeological sites in nine counties; field work that spanned over five years. This paper will discuss an overview of important sites encountered in this archaeological survey, as well as the successes and unintended consequences of utilizing veterans new to the curation of archaeological collections.

Lesure, Richard (UCLA)

[59] *Exchange and Interaction in Proto-Mesoamerica: A Comparison of Late Archaic and Early Formative Interregional Networks*

Across much of Mesoamerica, the transition from Archaic to Formative occurred essentially simultaneously at 1800±100 BC. The earliest sedentary, ceramic-using villages occurred in clusters, but the clusters themselves were widely dispersed. They appeared in a variety of environmental settings, and they were surrounded by lands that were either empty or still inhabited by low-visibility/low-density populations. Given such patterns, it is far from obvious what factors would explain the simultaneity of the transition from Archaic to Formative. The goal of this paper is to assess the promise of one idea: that the transition to sedentism and pottery use was at least in part the product of intensified long-distance interaction and exchange in the later Archaic. The research involves assembling evidence on the presence, frequency, and source of artifacts of non-local origin at Archaic and Early Formative sites (obsidian is a significant but not exclusive focus of attention). Assemblages will be assigned as appropriate to four periods: Early-Middle Archaic (prior to 3500 BC), Late Archaic (3500–1900 BC), Initial Early Formative (1900–1400 BC), and Late Early Formative (1400–1000 BC). Is there evidence for heightened interactions during the later Archaic? How do Late Archaic interregional networks compare to those of the Initial Early Formative?

Letouzé, Aliénor (CeRAP (Université Paris-Sorbonne/EHESS))

[30] *The “Sistema 7 Venado”, a Little-known Ceremonial Center at Monte Albán, Oaxaca: A Study of Its Architectural and Ritual Implications*
 For the past eight years, the French team from the CeRAP (Paris-Sorbonne University and the School for Advanced Studies in the Social Sciences in Paris) has carried out research at the Mesoamerican site of 7 Venado, which extends over 4 ha lying 400 m south of the South Platform of Monte Albán. Directed by Christian Duverger and Aliénor Letouzé, with the support of the INAH, the project has been able to date the site, whose chronology spans 800 BC to AD 300, and has also studied its spatial organization. It is composed of 14 buildings (pyramids, tall long platforms, etc.), arranged around 3 patios and 6 plazas articulated with monumental stairways. The work carried out since 2009 has enabled us to study new contexts at Monte Albán, first by excavating earlier buildings hidden under plazas, and second, by uncovering a large number of offerings of several types (caches, burials...). We propose to analyze the symbolic settlement of the Sistema 7 Venado through the spatial distribution of its architecture in conjunction with the evidence of ritual practices that marked the various cultural stages of this major archaeological site in Mesoamerica.

[28] *Pathways and the Power of Organizational Process: Defining Polity at Wari Camp, Belize*

The ancient Maya community of Wari Camp was organized into a quincunx pattern of four quarters delineated by the intersection of two inter-cardinal alignments. One was formed by a series of “temple-on-the-east” groups running northwest to southeast. The other consisted of a massive, northeast-to-southwest trending drainage modified for foot traffic. At their intersection stood an uncarved stela. Other stelae marked crossroads, while pairs of temple groups stood at entrances into the drainage road proper.

Michael Coe was the first to link the four-quarter scheme with Maya ritual practices celebrating the spatio-temporal limits of community. Other researchers demonstrated how such practices were essential rituals of royalty, some even noting the prominence of processional circuits among temple pairs. Still others pointed to the quincunx—the sign for road in Maya glyphs—as a fundamental trope in Maya thought and expression.

At Wari Camp, therefore, we have a confluence of material images that speak to some of the ways in which the most basic of Maya political units was constituted in symbol and action. This paper will attempt a deeper exploration of the powers inhering in such places, and will argue for the need to better identify them archaeologically.

[28] *Lithic Tool Use and Production in an Ancient Maya Neighborhood*

The use and production of lithic tools offers an avenue into the behavior and activities conducted in ancient residential and ritual contexts. We explore variability in the lithic assemblages of various contexts in the ancient Maya neighborhood of Tutu Uitz Na in the Late-Terminal Classic period (AD 700–900). Tutu Uitz Na is one of several neighborhoods surrounding the Lower Dover political center in the Belize River Valley. Variation in household lithic assemblages might vary based on the wealth and status of the occupants or specialized activities involving stone tools. This presentation comprises a synchronic comparative analysis of stone tools and debitage from an intermediate elite ceremonial and residential group, 4 commoner households of high and low status, a specialized lithic workshop and a ritual rockshelter associated with the intermediate elite group. The presentation will offer perspectives on the ways in which the study of lithics can illuminate the internal economic, agricultural, religious and political dynamics of a Classic Maya neighborhood, and the types of activities which people of varying statuses pursued.

[66] *The Burial Ground at Otstonwakin: Native American Mortuary Practices in 18th Century Pennsylvania*

The multinational village of Otstonwakin was a key nexus of colonial and indigenous interaction where colonial identities were expressed as well as constituted through material remains. The sacred landscape that was used by the residents of Otstonwakin to bury their dead was disturbed by road construction projects in both the late 1800s and early 1900s. While the full extent of the cemetery associated with Otstonwakin is unknown, the burial ground is represented by four documented graves and a wide array of funerary offerings, including a rare brass embellished fabric garment. Through an analysis of eyewitness accounts, photographs, and curated material evidence, I discuss the significance of the striking mixture of Native-made artifacts and imported European commodities uncovered at the burial ground. The mortuary practices attest to both change and continuity and reveal the creation of new constellations of material objects in ritual contexts.

[297] *Animal Bones from Hazor, Israel and a Cautionary Tale of Interpreting Past Ritual*

Within recent years, feasting and other forms of ritual consumption have become more frequently identified in the archaeozoological record of the ancient Near East. Reasons for more frequent identification of ritual sacrifices and feasts vary, but two driving forces certainly are archaeological context, bones found in or near special architecture, and the cultural milieu formed by the region’s ancient textual record. In contrast, I have a skeptical

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

tale to tell of ritual production and consumption. This tale takes place at the site of Hazor, a Bronze and Iron Age city mound in Israel. The site has all the correct elements to demonstrate ancient food-related rituals: It was a city of great size and importance; a place where excavations have revealed temples and/or impressive palaces, cuneiform texts and statues of gods; and which produced large bone assemblages. Yet archaeozoological analyses demonstrate a disjuncture between bone patterning on one hand and expectations set by texts and contexts on the other. The question is how to understand the bone debris left by Hazor's elite: Does it represent the diet of uncharacteristically proletarian rulers and priests, or does the patterning present a cautionary tale about too much reliance on text and context?

[172] *At-Risk World Heritage and the Digital Humanities—An Overview of the UC Office of the President's Research Catalyst Project*
Recent current events have dramatically highlighted the vulnerability of the world's material cultural heritage. Funded by a University of California (UC) Office of the President's Research Catalyst grant beginning in 2016, the At-Risk Cultural Heritage and the Digital Humanities project catalyzes a collaborative research effort by four UC campuses (San Diego, Berkeley, Los Angeles and Merced) to use cyber-archaeology and computer graphics to document and safeguard virtually some of the most at-risk heritage objects and places. Faculty and students involved in this project are conducting path-breaking archaeological research covering more than 10,000 years of culture and architecture in Cyprus, Greece, Egypt, Ethiopia, Israel, Jordan, Morocco, and Turkey. Our aim is to link UC labs, libraries and museums to form a highly-networked collaborative platform for curation, analysis, and visualization of 3D archaeological heritage data. This paper presents a summary of the objectives of the project and digital field data acquisition and technical achievements since the inception of the project.

[141] *A Pyro-Engraved Gourd from Cahuachi: Iconographic and Technical Analysis of a Nasca Masterpiece*
Pyro-engraved gourds discovered by the "Nasca Project" (CEAP) in Cahuachi, Nasca ceremonial center located in the basin of Río Grande, can provide new data about their manufacture and decoration. From a comparative perspective, we study artifact characteristics and archaeological records to understand an unusually large and complex pyro-engraved found during 1994 excavations as an offering associated with ceramics from the last phase of the Early Horizon (Ocucaje 8–9) and the beginning of the Early Intermediate Period (Nasca 1–3). Now on display at the Museo Didáctico Antonini in Nasca, the gourd has Paracas Necrópolis (Topará) and early Nasca elements in its decoration suggesting the existence of an efficient system of social cohesion based on shared rituals. Objects of power with similar iconography marking shared memory include textiles, ceramics, pyro-engraved gourds, and other artifacts related to funerary cult, ritual feasting and music, which express shared elements of social and political identity. The characteristics of the gourd, the production practices that convert it into an object of power, the stylistic conventions of the ritual imagery and its mythological references illuminate relationships between Andean populations and their environment.

[87] *Child's Play? Exploring Archaeological Evidence for Care-Giving in the 19th and 20th Centuries*

This paper will consider how archaeological evidence from two case-studies can inform our understanding of how attitudes to child care affected children's lived experience. I will explore the character and range of archaeological evidence relating to childhood from two very different sites, a 19th-century mission complex in San Diego and a mid-20th century council estate in Lincolnshire, comparing ratios of different types of finds (e.g. marbles, metal toys, doll parts and slate pencils) to consider how archaeology can illuminate differences in the way children were cared for compared with the 'norms' of English nuclear families in the 19th and 20th centuries.

Lewis, D'andra (Pennsylvania State University Student)

[98] *Scottish Whisky: A Community's Development and Global Impact*

For millennial alcohol has played a prevalent role in the development of communities and human interaction. Scotland is well known for the creation of whisky that made its way to America during the Colonial Period. The goal of this research is to identify the influence alcohol has had on the development of Scotland. Scotland whisky distribution has caused a change in laws, economics, health perspective, and tradition. According to Bill Walker, "Scotch whisky is more than a whisky. It is part of Scotland's heritage and folklore. It is used as a medicine to cure many ills. As a toddy, it can dispel colds and 'flu. In porridge, it can drive out the freezing cold of Scotland's winters. It lubricates the larynx and helps parties go with a swing" (Bower, 2016). As people began migrating from Scotland to America, they brought with them their knowledge of whisky production. Although the entire population of Scotland does not consume alcohol, this product can still be used as an indicator to understand their cultural background. It can also lend explanations to better understand drinking cultures in the United States.

[338] *Equity in the Academy and in Archeology*

Recent national media attention on issues of discrimination and harassment in the academy have generated robust discussion and inquiry into how to develop and sustain an environment that celebrates equity and equality and creates a culture where all can thrive professionally and personally. This presentation will sketch the broad contours of these conversations placing them in a national context and providing a framework to understand both institutional responsibilities and ethical imperatives. By outlining the nature and scope of Title IX and other civil rights mandates as they apply across the academy, this presentation provides a foundation for exploring the specific challenges of achieving equity in archeology.

[336] *Mineral Resources and Metallurgical Technologies along the Southern Silk Road*

China's southwest region has vast terrain and diverse landscape with rich mineral resources. From the bronze age to the iron age, this area existed two very obvious metallurgical technology systems, "Central Plains" and "non-Central Plains". The coexistence of two systems is not only the result of "sinification", but also the result of the circulation of metallurgical resource and transmission of technology as social response in the mountainous environment in southwest China.

[3] *3D Hydraulic Modeling of the Ancient Irrigation System at the MGK Site in Xinjiang, China*

Most archaeologists would agree that ancient irrigation systems preserve important information about the technology, economy, and social organization of past societies. However, considering that archaeologists generally lack training in hydraulics, it is often difficult for us to extract much information from an ancient irrigation system beyond basic description and chronology. Thanks to the recent development in drone technology and flow modeling techniques we now have the option of generating 3D models of ancient irrigation systems and evaluate their hydraulic performance on desktops. In this case study, we demonstrate how these new methods have helped us achieve a deeper understanding of a complicated irrigation system in Xinjiang, China. We further suggest that the application of these methods can be expanded to other areas of archaeology, such as surface surveys.

[85] *From the Hills of Appalachia to the Shores of Lake Erie: Landscape Archaeology in Northern Ohio*

Northern Ohio is the intersection of several physiographic zones and drainage sub basins. Where the eastern edge of the dissected Allegheny plateau meets the broad till and Lake Plains of western Ohio, the difference in the landscape is apparent. Between 2015 and 2017, SWCA, worked to complete a 217-mile survey across Northern Ohio for a large natural gas pipeline project. The project investigated almost 10,000 acres, and recorded close to 500 archaeological resources. The dataset generated through this extensive survey provides a detailed look at the prehistoric landscape of northern Ohio. When combined with previously recorded sites and the results of other similar linear projects, the information generated by the project provides an excellent data set to compare prehistoric settlement patterns between physiographic provinces as well as identifying key features in the prehistoric landscape. With the increased development of natural gas infrastructure in the region, the authors' hope is to highlight the science being conducted behind the development and to convey the results of the archaeology being performed to the professional community.

[119] *Prelude to the Protohistoric: Late Mississippian Settlement Dynamics in the Central and Upper Tombigbee River Drainage*

This paper examines settlement patterns of the late pre-Contact era (1300–1500 C.E.) in the central and upper Tombigbee River, with a focus on the Blackland Prairie portion. Mississippian and Protohistoric settlement strategies and chronologies are overviewed with an eye toward understanding the coalescence of Contact-era polities and the abandonment of the Tombigbee floodplain. Climatological, sociopolitical, and demographic factors are evaluated. Decentralization as a bottom-up response to resource stress and a strategy of resistance to warfare and exploitation exacerbated by climate change may explain some pre-Contact population movements observed in the archaeological record.

[275] *Second Thoughts on First Contacts in the American Southwest*

The enigmatic first contacts between the Zuni people and Esteban Dorantes, an enslaved Moor, has provided fodder for historical and anthropological speculation for more than 475 years. Conjecture regarding what really happened between Esteban and the Zuni began within a few days of this initial encounter in 1539, and continues down to the present day. Despite centuries of debate, supposition, and guesswork based on scanty historical records, archaeological evidence has yet to be brought to bear on these events. This paper examines what the discipline of archaeology might bring to the study of first contacts throughout the Spanish Empire, comparing the events that occurred at Zuni in 1539 with first contact narratives from the Caribbean and Southeastern North America. It also investigates the implications of First Contact narratives for notions of cultural persistence and contemporary Native American identity in the 21st century.

[215] *The Future of Archaeological Research on Public Lands: A Case Study from California*

Lynne Goldstein has been on the front lines in developing innovative field programs for the study of diverse places in North America. This paper examines her influence on archaeological investigations undertaken at the Russian colony of Ross in northern California. A significant trend in the study of sites on public lands is the shift from broad-scale, high-impact excavations to low-impact field practices. The paper outlines her legacy in the development of coordinated research programs that involve museum investigations of older archaeological collections in combination with the strategic use of limited, fine-grained fieldwork.

Ligman, Michael (Logan Simpson), Tina Hart (Logan Simpson) and Michael L. Terlep (Logan Simpson)

[38] *Portable XRF Analysis of Rock Art Pigments Used in Pictographs across the Great Basin*

Although portable X-ray fluorescence (pXRF) has routinely been used successfully to identify the geochemical source of lithic materials across North America, comparatively few studies apply pXRF to compositional and geochemical sourcing studies of rock art pigments. Logan Simpson conducted exploratory in situ analyses using non-invasive pXRF to analyze the elemental composition of manufactured rock art pigments used to produce prehistoric pictographs at several rock art sites across the Great Basin. Results from these analyses are used to evaluate the potential of this type of analysis within the Great Basin region to: identify the minerals used in pigments; differentiate between pigment types; infer pigment preparation and application techniques; and detect the work of different artists, painting events, and re-touch episodes. GIS was also used to study the relationship between rock art sites and potential sources of pigments.

Lin, Sam (University of Wollongong)**[137]** *Archaeological Science or Scientific Archaeology: Where Does “Science” Lie in Stone Artefact Research?*

Archaeological science is defined as the use of scientific techniques, typically derived from the natural sciences, in archaeology. In lithic research, archaeological science studies have investigated topics ranging from identifying raw material sources, assessing artefact function and technology, to modelling socio-cultural and evolutionary changes. However, this method-centred definition of archaeological science has also led to a focus on the “sciency” appeal of techniques over basic principles of the general science method, namely falsification (“how do I know if I am wrong?”) and validation against uncertainty (“how confident can I be in my explanation as opposed to other explanations?”). Despite the flourish of archaeological science, much of lithic research still operate on analytical units embedded with implicit behavioural assumptions that are difficult to falsify, and a largely common-sensical reasoning process that favours explanations relatable to our modern daily experience. By reviewing other archaeological science approaches, it is argued here that a more explicit discussion of the general science framework is needed in lithic research, with particular concern over the nature of analytical categories, the integrity and confidence of inference, and the ability to objectively evaluate competing causal explanations for the formation of archaeological pattern through multiple lines of evidence.

Lindley, Tiffany (The University of Texas at San Antonio)**[28]** *Examining Everyday Lives: Non-Elite Maya Households and the Terminal Classic Collapse*

In this paper I will discuss recent archaeological investigations at the Floodplain North settlement cluster, located within the Rancho San Lorenzo Survey Area in Belize’s Mopan River valley. My research investigates the adaptive responses of non-elite Maya to Terminal Classic (AD 780–900) socioeconomic and political transformations. Preliminary analysis indicates occupation continued at Floodplain North after the Terminal Classic collapse and the abandonment of nearby settlements. Materials recovered from patio groups in the settlement cluster suggest residents exploited the area and its resources over several hundred years, from the Late Classic through the Early Postclassic.

Excavations revealed a large structure with multiple construction phases and possible ancillary buildings. Within the structure, there were three separate interments each with multiple individuals. The burial data suggest the household group utilized the structure over a long period of time, culminating in the Terminal Classic. Preliminary analysis of a similar group in the settlement cluster revealed occupation of the settlement began as early as the Late Classic (AD 670–780). Investigations of Floodplain North provide a detailed look into the everyday lives of non-elite Maya prior to and after the Terminal Classic collapse.

Linford, Samantha (The University of Colorado Boulder)**[27]** *Design Analysis, Social Identity and Ancestral Pueblo Migration: Southwest Colorado to Northern New Mexico*

Between PIII and PIV the Southwest saw the largest shift in population from the Mesa Verde region (SW Colorado) to the Northern Rio Grande (N. New Mexico). Traces of this migration are difficult to identify in material culture, but Pueblo oral traditions document the migration from the North and discuss two moieties: summer and winter. My research aims to understand dual division within Pueblo society and whether summer and winter

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

moieties can be referenced through ceramic designs before and after the migration to the Northern Rio Grande. Utilizing conceptual metaphor theory, I compare ceramic designs pre-migration in the Sand Canyon and Goodman Point Pueblo communities with designs post-migration in the Northern Rio Grande particularly at Cuyamungue and Tsama Pueblos. My research will investigate whether Tewa moieties emerged pre-migration or not. Several possibilities exist for the origin of Tewa moieties: 1) Tewa moieties emerged from kin-structured moieties (Whiteley 2015); 2) they emerged with great kivas in BMIII (Ware 2014). This research aims to contribute to the knowledge regarding the history of dual organization in this Puebloan tradition through the analyses of pottery designs, guided by ideas concerning the symbolic associations of Tewa moieties and Mesa Verde region pottery.

[9] *Benefits of CT-Scanning in Study of Post-Medieval Funerary Items*

CT-scanning has for long been utilized in the research of mummified individuals, and has been a crucial method used to analyze also northern Finnish mummified human remains. Within Church, Space and Memory -project at the University of Oulu in Finland, eight individuals, mostly children, buried under floor planks of churches have been lifted up with their coffins, and taken for CT-scanning at the Oulu University Hospital. The CT-scans have proved to be suitable also for studying coffins, funerary textiles and associated accessories. This poster will present both benefits and restrictions of this method. CT scans densities of substances and allows analysis of substance surfaces and internal structure. Limitations include separating adjacent substances with similar densities. CT-scanning images for instance reveal tree rings of the coffins, mattress materials, different layers of textiles, and metal artefacts covered by fabrics. In our enquiries we have also micro-CT-scanned individual textiles from archaeological contexts. Micro-CT-scanning enables detailed study of textile structures and sewing patterns. Individually scanned items include caps and knitted products with multiple textile layers that otherwise could not be studied without breaking the items. The greatest benefit of this method is the undestructive research that allows to peek inside textile structures and coffins.

[132] *Incas and Yumbos at Palmitopamba, Tulipe and Other Notable Sites on the Northwestern Periphery of Tawantinsuyo*

Survey and excavation data from the western Pichincha cloud forest of northwestern Ecuador have provided tantalizing evidence of an unusual relationship between Incas and the autochthonous Yumbo populations. The monumental pool site of Tulipe, the terraced hill complex of Palmitopamba, and the pucarás of Chacapata and Capillapamba all provide an extraordinary view of the tentative, late expansion of Tawantinsuyo into the sub-Andean jungle of northern Ecuador. After a dozen seasons of excavation and study in the Palmitopamba locality, we have evidence on Inca-Yumbo craft production, peaceful coexistence, absence of tribute, and a possible Inca refuge from the Spanish, among other information. These results are compiled in this study of Inca-local relations during the final years and at the northern extreme of the Inca Empire.

Lippiello, Lauren (FCC)

[73] *Watercraft: The Earliest Temples in Egypt*

Shared iconography and similar functionality associated with dated depictions of Predynastic watercraft and terrestrial shrines identify watercraft as the earliest manifestation of manufactured sacred space in Egypt. The resulting Mobile Sacred Space Paradigm describes watercraft as ritual objects (liminal negotiators) empowered to move through and, thereby, connect three ecologically distinctive landscapes as early as the Naqada IIB Period (and possibly Naqada IC). Results indicate that specific watercraft and their associated paraphernalia represent the earliest temple as the mound of creation, 3250 BCE, a window into the politico-religious foundations of the Egyptian State. The environmental flexibility as well as diachronic endurance of core religious values associated with watercraft suggest strong ideological continuity from the Predynastic through Dynastic Periods.

Liss, Brady (University of California, San Diego), Matthew Howland (University of California, San Diego) and Thomas E. Levy (University of California, San Diego)**[68]** *Testing Google Earth Engine for Remote Sensing in Archaeology: Case Studies from Faynan, Jordan*

Satellite imagery and remote sensing have secured a place in the archaeological toolbox, but the scale of satellite derived data often results in large datasets with individual image tiles consisting of many gigabytes. Consequently, performing complex analyses on satellite data can be computationally intensive to a prohibitive degree. Google Earth Engine (GEE), an in-development, cloud-based platform for visualizing/analyzing satellite imagery, affords a solution for researchers with limited access to computational processing power (Gorelick et al. 2017). GEE is freely accessible through a web browser, but analysis is completed on Google's cyber-infrastructure, facilitating rapid analyses on any scale (including planetary). Moreover, through the GEE platform, users can create custom scripts to suit their specific research questions and needs. This paper explores potential contributions of GEE to archaeological research through two case studies. First, GEE was used to automatically identify specific archaeological features across the Faynan region of Southern Jordan. Second, GEE-based edge-detection and automatic vectorization was tested for mapping archaeological sites at the Iron Age (ca. 1200–900 BCE) site of Khirbat al-Jariya in Faynan. Through these trials, GEE proved a viable tool for archaeological research with significant potential to supplement traditional forms of archaeological survey and mapping.

Liston, Maria (University of Waterloo, Ontario)**[298]** *Exploring the Evidence for Infectious Diseases in Byzantine Thebes, Greece*

The excavation of an early and middle Byzantine cemetery, located in the former Sanctuary of Ismenion Apollo in Thebes, Greece, has provided an opportunity to examine the impact of infectious diseases in post-Classical Greece. The cemetery appears to be associated with a previously undocumented hospital, probably connected with the nearby church of St. Luke the Evangelist. The skeletons were found in rectangular rock-cut graves, all of which contained multiple burials. Two non-standard graves held multiple burials that had been placed in the cutting all at once. We interpret these as mass graves, associated with a catastrophic event, possibly the Justinianic plague. Other graves were used repeatedly, often with much of the upper bodies above the hips being removed prior to subsequent burials. 100% of the graves have multiple individuals with significant bone pathologies. The differential diagnosis of lesions suggests that leprosy was found in approximately 50% of the skeletons, supporting our interpretation that the cemetery is associated with a hospital or hospice. Leprosy appears to co-occur with other infections including brucellosis. Pathogen DNA analysis should help to confirm the diagnosis of these diseases and this project will provide a better understanding of the infectious pathogens that troubled Byzantine Thebes.

Litschi, Melissa (Southern Illinois University, Carbondale)**[65]** *The Biology and Mythology of Ancestor Lithification in the Andes*

Throughout human history, many cultures have told stories about people who turned to stone in death. What is the inspiration for these myths? How do they relate to taphonomic processes that affect deceased organisms? This paper addresses these questions in an Andean context by comparing pre-Hispanic narratives of lithification to post-mortem biological processes. In the Andes, tales of lithification focus on ancestors and local heroes, who, in their petrified state, continue to interact with the living by mediating between their descendants and supernatural deities. Ethnographies and ethnohistories describe large upright stones (huancas) and natural stone formations (huacas) who received the same care from their descendants as mummified ancestral remains and contextual evidence has allowed examples of modified and unmodified stone huancas to be identified in the archaeological record. The equivalency in the treatment of huancas and mummified ancestors raises interesting questions regarding the conceptual relationship between stone and the dead. One possible explanation argues Andean people were motivated to create this association by the desire to transfer qualities of stone (durability) to their ancestors. However, processes of lithification (fossilization) are not purely abstract mythologies. Could Andean beliefs regarding lithification also represent a compressed and abstracted interpretation of taphonomic processes?

Liu, Chin-hsin (California State University Northridge) and Coralia Guandique (California State University Northridge)**[56]** *Dental Health Assessment of Nil Kham Haeng and Its Implications in Prehistoric Central Thailand*

Three adjacent, chronologically overlapped, and metallurgically active sites in central Thailand were excavated by the Thailand Archaeometallurgy Project (TAP). This study focuses on dental pathology (caries, calculus, periapical abscessing, antemortem tooth loss, linear enamel hypoplasia) observed on human skeletal remains from Nil Kham Haeng (500 B.C.-A.D. 600) to investigate possible foodways and lifeways of its inhabitants. Among approximately 20 individuals represented, 16 have sufficient dental elements preserved for observation (252 teeth, 145 sockets). When the results are contextualized with another TAP site of Non Mak La and other contemporaneous sites in the region, Nil Kham Haeng shows high prevalence of dental calculus, moderate level of antemortem tooth loss, and negligible to no occurrence for all other indicators. This pattern is consistent with that observed across prehistoric Mainland Southeast Asia. This can be attributable to the consumption of rice and/or millet as staples and broad-spectrum diets. Combined with pending stable isotope analysis, a clearer picture of Nil Kham Haeng dietary pattern will contribute to the poorly understood human lifeways in prehistoric central Thailand.

[137] *A Complex History of Human-Environment Interaction Revealed by the Study of Metal Production Industries in Imperial China*

The study of technology with archaeological science approaches is a powerful proxy for investigating the history of human-environment interactions and provides essential information which could not be revealed by other types of evidence. This great potential was however not fully exploited in previous works. Here we present an on-going project of archaeometallurgical investigation of 7th-15th century silver-lead production sites in China. Environmental history study agreed that during this period, mineral coal replaced charcoal and became the main fuel of metal industry in China. Our investigation however reveals this is a rather complex and uneven process. In the more arid and densely populated north China coal-fired tubular crucibles were widely adopted in this period. In contrast, the south China smelters continued the more traditional furnace smelting process. More interestingly, crucible technology seems not to be embraced by iron and copper smelters until early modern period. Even in north China, large scale iron smelters still use charcoal rather than mineral coal. This work showcases the power of archaeological study of technology in enhancing our understanding of the complex history of human-environment interactions.

[38] *Stones and Standing Waves: Integrating Interpretation with Emergent Methods in Petroglyph Studies*

Recent systematic study of petroglyphs and pictographs at select sites in the Great Basin and Mojave Desert explores archaeoacoustic connections between rock art and oral tradition. This project illustrates data collection procedures which integrate emergent, non-impacting methods, with interpretation facilitated by post-positivist thought. Research design is nonetheless framed within the scientific method. Systematic experiments incorporated into this study explore the viability of, and consistency with, a number of previous relevant studies. As the culmination of several field sessions at two dramatic slot canyon sites in Basin / Mojave convergence, results here graphically illustrate dramatic visual and acoustical qualities of potential sacred sites. Relevance of acoustical data is thoroughly substantiated within the contexts of Numic oral traditions linked with place and peoples. Discussion concludes with explanations of how datasets produced here, and elsewhere with comparable methods, may prove useful in addressing other avenues of theoretical exploration, especially archaeoastronomy and its implications.

[134] *Photogrammetric Techniques for Digital Documentation of Subterranean Maya Architecture*

Photogrammetric techniques are increasingly being used for documenting cultural heritage sites for digital preservation and analysis, but the challenges of working in constrained spaces with difficult lighting conditions have encumbered widespread adoption in subterranean environments. The Proyecto Arquitectura Subterránea de Quintana Roo, coordinated by the Cultural Heritage Engineering Initiative (CHEI), at the University of California San Diego, in collaboration with the Instituto Nacional de Antropología e Historia in Mexico, is conducting a survey and program of digital documentation of cave shrines in Quintana Roo, Mexico. Due to rapid development and population expansion in the area, these sites are increasingly being exposed to the threat of vandalism, necessitating the development of efficient 3D reality-capture tools to fully and accurately document the sites before they are further damaged.

[111] *Tree Island Life: Late Archaic Adaptations of a Northern Everglades Community*

The Wedgworth Midden (8PB16175), a Late Archaic tree island site near Belle Glade, Florida, produced large quantities of faunal remains during excavations undertaken by Florida Gulf Coast University in May of 2016. Analysis of these remains allows insight into patterns of resource acquisition and reveals ways in which people adapted to the local environment. Comparison of proportions of taxa from different occupational periods allows us to trace changes in resource use and sheds light on questions concerning the timing and nature of human settlement in the region and changes in strategies of resource acquisition through time.

[179] *Shards of Medical History: Artifacts from the Point San Jose Hospital Medical Waste Pit*

While monitoring lead remediation activities around historic buildings at Point San Jose (now Fort Mason) in 2010, National Park Service archaeologists discovered thousands of human bones in a medical waste pit behind the former hospital. Large numbers of medical artifacts, primarily medicinal bottle shards, were also recovered from the pit. Many of these medicinal bottles were produced by the U.S. Army Hospital Department for a

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

limited time during the Civil War (1862–1865). Such precise manufacturing dates help to firmly establish the terminus post quem for the pit. This assortment of Hospital Department bottles is rare in the archaeological record. Other medicinal bottles, alcoholic beverage containers, administrative supply bottles, food waste, and a few personal items including buttons, tobacco pipes, and one hair oil bottle comprise the remainder of the collection. In addition to establishing a date for the deposit, the specific nature of these artifacts may help to explain why the pit was created, as well as contribute to our understanding of late 19th century military medical practice.

Lockett-Harris, Joshua

[8] *Caves, Ancestors, and the Underworld: Bedrock Manipulation as a Strategy in the Development of Middle Formative Period Maya Socio-political Complexity, Based on Evidence from Ka'Kabish, Northern Belize*

Growing evidence suggests the ancient Maya conceptualized caves, as well as small crevices in the karstic bedrock (both natural and artificial), as sacred ch'een—portals of shamanic communication, which existed in a liminal realm between the physical world and the ancestral powers of the cave-riddled Underworld. Ch'een represented important ritual foci for the ancient Maya, as well as receptacles for sacred offerings. The interment of prominent ancestors and symbolically valuable materials within natural crevices or artificial bedrock openings—accompanied by ritual commemoration, competitive commensality, and the construction of public ritual architecture—represented a coherent strategy to cement a group or lineage's claim to an area, and legitimize their authority through control of the sacred space thus created. Based on evidence from Middle Formative Period (1000–300 B.C.E.) Ka'Kabish, Northern Belize, this poster will demonstrate that artificial openings in the karstic bedrock of the Maya Lowland were understood through ch'een ideologies of the sacred Underworld, and that the active manipulation of these ideologies served as a catalytic means of transcending existing social ranking in order to create increasingly complex socio-political hierarchies, in a process that would lead to the coalescence of divine Maya kingship, or chulul ahu.

[282] *Belonging and Exclusion in Early Colonial Huamanga (Ayacucho), Peru: An Isotopic, Religious and Archival View*

Built in AD 1605, La Iglesia de la Compañía de Jesús de Huamanga is the earliest Jesuit church in modern-day Ayacucho, Peru. Archaeological excavations underneath the church floor uncovered human and faunal remains dating to the 17th and 18th centuries CE. Only indigenous individuals appear to be buried underneath the church floors. Despite significant forced labor practices (mita) at the time, few individuals buried in the church show signs of bodily stress or disease prevalent in those engaged in mining. Beyond the simple and sometimes problematic dichotomy of Spanish and indigenous, it seems likely that additional divisions appeared when considering the application and avoidance of the mita system of forced labor. In addition to bioarchaeological evidence, ethnohistorical documents show that some indigenous Andeans used the Spanish legal system, church service and labor agreements to evade forced labor at the mines. Further, analyses of strontium isotopes reveal that one-third of the individuals were not born locally, correlating with census records documenting rural migration into the city. Indigenous Andeans actively shaped their lives, using migration and manipulation of Spanish religious and legal systems to avoid the harshest occupations, thus moving beyond the stereotypical Black Legend trope.

Loffler, German

[46] *Digital Standardization of Ceramic Nomenclature: A Case for Central Coast Peruvian Pottery Forms during the Late Intermediate Period*

In this paper, I present a generalized morphological typology for all Central Coast Peruvian ceramic vessels. Today, as in the past, similarly shaped (or in some cases identically shaped) vessel forms have been given different names by different authors, obfuscating another's researcher's ability to cross reference ceramic forms rapidly. As publishable material becomes increasingly digitalized and online accessible, it is not hard to imagine a "patch" program that identifies differently named vessel forms and auto-renames the forms to such a generalized morphological typology. The benefits are threefold: standardized typological names in all digital material, ability to access most relevant publications with ceramic vessels of interest, and rapid single word search parameters.

[74] *Evaluating Collagen Pretreatment with XAD Resin*

The presence of exogenous organic carbon is a major concern when radiocarbon dating bone. In particular, the analysis of bone that has undergone diagenesis can be frustrating because the process of humification may potentially introduce contaminant organic carbon. Diagenesis occurs during burial and results from a combination of two distinct processes: (1) reactions involving indigenous organic carbon, (2) the complexation of collagen with soil humic substances. The radiocarbon measurement of altered bone, then, affects the age of the bone and reflects the presence of the exogenous humic carbon. Because the influence of contamination on radiocarbon measurements is dependent on the age of the sample, removal of humic carbon, particularly for older samples, is a necessity for accurate measurement. Pretreatment methods, such as XAD treatment and single-amino acid radiocarbon dating, have been applied to eliminate contaminant carbon and provide a purified sample for dating. In this study, we assessed the effectiveness of XAD for the removal of humics using a controlled study and present suggested modifications to the procedure.

[261] *Cultural Resources in an Era of "Energy Dominance": Process and Policy for BLM Oil and Gas Leasing*

The Bureau of Land Management's (BLM) mission of multiple use is unique among federal agencies. Managing areas with cultural resources for multiple use is a tricky balancing act of NEPA, NHPA, Native American Consultation, Bureau directives and policy, and Statewide policy. Add public scoping and consulting parties representing the local community and special interest groups and things get even more complicated. This paper discusses the challenges associated with oil and gas lease sales that BLM cultural resource specialists face every year. Landmark and innovate approaches to cultural compliance for lease sales will be discussed including issues associated with the "keep it in the ground" movement, lease sales near national parks and monuments, and the Badger Two Medicine case. How these lease sales have progressed has implications for future lease sales Bureau-wide. A discussion of the December 2017 Lease sale process and results for the Price Field Office will discuss the local implications of national policy and court decisions.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Lohse, Jon (Coastal Environments, Inc.)**[59]** *Yuzanu 50, An Early Paleoindian Site in the Mixteca Alta*

Yuzanu 50 was discovered during a reconnaissance of the headwaters of the Yuzanu River as a scatter of debitage eroding from a barranca cutbank, from a palaeosol formed under wet meadows that lined the stream from the Terminal Pleistocene into the Holocene. Excavations exposed 15m² of an occupation surface buried 13.5m below modern ground surface. An excavated assemblage consisting almost exclusively of biface reduction debris made of materials that crop out further upstream indicates that this was a short-term occupation with retooling as a primary activity. A broken preform and characteristics of the flaking debris provide indications of reduction strategies. Two informal flake tools and a pair of non-diagnostic bifaces reflect generalized activities. There are few bones, but a long bone diaphysis from a deer-sized animal has cut marks. Radiocarbon dating suggests an age of around 12,750 cal BP. While not extensive, Yuz 50 is among the most securely dated early sites in southern Mexico, and indicates that Pleistocene foragers inhabited high altitude environments, were familiar with local lithic outcrops, and probably used barranca floodplains in their subsistence activities. The large number of megafaunal bones in the same palaeosol complex raises the possibility that these included hunting large prey.

Loiselle, Hope**[10]** *The Historical Ecology of Dolphins and Porpoises off the Oregon and Pacific Northwest Coasts: Contributions from Zooarchaeology*

Wide-scale excavations were undertaken in the middens at Seaside, Oregon in the 1960s and 1970s. However, due to the overwhelming amount of faunal material, much of it remains unanalyzed. This project focuses on the material from the Par-Tee midden (35CLT20). The only cetaceans analyzed from this midden are whales, leaving a knowledge gap about prehistoric human interaction with smaller cetaceans, such as dolphins and porpoises. Using the cetacean comparative and reference collection at the Smithsonian Institution's Museum Support Center, the small cetacean remains have been identified. Species composition and abundance data are compared with modern stranding data to help elucidate whether small cetaceans were actively hunted or if stranded animals were scavenged. Additionally, the small cetacean data from Seaside will be placed into the broader context of small cetacean exploitation in the northeastern Pacific Ocean and compared to data from other archaeological sites. This allows for a temporal and spatial analysis of small cetacean species abundances and distributions in the region. This data is also compared to herring data of the northeastern Pacific, a common food source of small cetaceans, to note if there is a possible correlation between the two.

Loosle, Byron**[261]** *Why We Shouldn't Wait until a Project Is Proposed*

Tribal officials suggest the National Historic Preservation Act should more appropriately be called the National Mitigation Act. For several years we worked to develop policy to direct more effort into identification of areas of cultural concern even before projects proposals were received. We advocated production of appositely designed projects to reduce the amount of adverse effects and mitigation. This effort included encouraging the use of the planning process to assemble data and add protections to important areas. The recent rescission of the Bureau of Land Management's Planning Rule creates challenges in our effort to refocus cultural resource management away from mitigation. In light of current administration policies to open lands for development, what can be done to protect important resources before a project is proposed? We will examine several available options.

Lopez, Escee (Department of Anthropology, California State University, Los Angeles), Santos Cisceneros (Department of Anthropology, California State University), Shelby Medina (Department of Anthropology, California State University), Jessica Morales (Department of Anthropology, California State University) and Rene Vellanoweth (Department of Anthropology, California State University)**[225]** *Economic and Style Trends of Shell Beads from the Tule Creek Village Site (CA-SNI-25) of San Nicolas Island, California*

Native peoples of Southern California developed complex systems of trades through non-monetary exchanges of items such as beads. Through these exchanges and interactions, socioeconomic structures within intra-local and extra-local communities evolved to fit individual governing societies. The Tule Creek Village was the epicenter of cultural and social development during the Late Holocene on San Nicolas Island. It harbored a myriad bead types distributed among the residential and ceremonial complexes at the site. In this study we analyze the stylistic, spatial, and temporal sequences of beads to understand the fluctuating market trends in the village and interactions with surrounding societies.

Lopez, Julieta (UNAM), Shigeru Kabata (UDLAP), Tatsuya Murakami (Tulane University) and Manuel Ramirez (UDLAP)**[262]** *Monumental Architecture in Central Mexico during the Terminal Formative: New Findings from the Tlalancaleca Archaeological Project, Puebla*

Tlalancaleca was one of the largest settlements before the rise of Teotihuacan in Central Mexico and has been known for the presence of early talud-tablero facades (a combination of sloping walls and vertical panels) and other cultural elements inherited by Teotihuacan. This paper presents preliminary results of excavations, which were carried at monumental structures at Tlalancaleca. It examines the construction techniques used for monument building (including talud-tablero facades), the degree of urban planning, and the temporal relationship between monumental construction and the urban development based on new radiocarbon dates. Preliminary analysis suggests that monumental construction and reconstruction was heightened during the Terminal Formative period and was associated with urban expansion after the eruption of Popocatepetl around AD 50. While there was no central avenue at Tlalancaleca, we have noted a certain degree of standardization of main axes for monumental building. Such a standardization suggests the integrated nature of several monumental complexes. Finally, we discuss the implications of our findings for better understanding sociopolitical dynamics in Central Mexico during the Terminal Formative.

López Corral, Aurelio (Instituto Nacional de Antropología e Historia)

[31] *Where Is Camaxtli? Assessing the Iconography of Tlaxcallan Collective Government*

Scholars have acknowledged, for many decades, that Late Postclassic Tlaxcalla (n1250/1300–1519 A.D.) was a state level political entity ruled by a form of collective government having Camaxtli as its main patron deity. Both conceptions are constantly reproduced in academic work although they derive explicitly from sixteenth century historical sources. Unfortunately, few works have undertaken the task of contrasting colonial writings against archaeological evidence in order to test if such information is valid. In an effort to better understand prehispanic Tlaxcallan sociopolitical organization, including the role of Camaxtli as a group unifying figure, this work examines the degree of collective ideology dissemination among the different social sectors by identifying political propaganda in artistic expressions such as polychrome pottery, mural painting, sculptures and figurines. Recognizing artistic depictions of deities, individuals, cargo positions, leaders, or ancestors is relevant to anthropological theory because it can shed light on aspects of the prevalent form of governance, its political orientation, and the ideological traits reproduced throughout the society.

López López, Alba (Formative Etlatongo Project) and Ricardo Higelin Ponce de León (Indiana University Bloomington)

[288] *Funerary Architecture in Public Space: The Case of Burial 10 at Etlatongo, Mixteca Alta, Oaxaca*

Mesoamerican architecture is characterized by its variety of forms, constructive techniques and functions through time. This can be seen in the Formative pre-urban settlement at Etlatongo, Mixteca Alta, Oaxaca, which was occupied from the Early Formative to the Postclassic period, where among the architectural configurations, we can find structures associated to different human activities.

From all burials founded in public spaces at Etlatongo, we observed that no burial has funerary architecture, with exception of Burial 10. Thus, Burial 10 has architectural characteristics such as a line of stone slabs similar to other funerary architecture pattern in Oaxaca.

It is possible that beyond this funerary structure, considering as a physical element, lies an ideology or reason to be, so Burial 10 could reflected one traceable feature to an organized form of society.

Therefore, this paper will address the relevance of the architecture and characteristics of burial 10, and a brief comparison with the spatial distribution of burials founded in public spaces at Etlatongo.

López Mazz, José (Universidad de la República, Uruguay)

[43] *Prehistoric Dogs in the Uruguay Lowlands*

This paper presents archaeological information about domestic dogs (*Canis lupus familiaris*) recovered in prehistoric sites in the southeastern lowlands of Uruguay. The presence of dog in the archaeological record is associated to horticultural activities of hunter-gatherers adapted to the very dynamic conditions of this flood ecosystem during the Holocene. Dog findings in mounds have a recurrent and unique association with burials. This context allows a starting discussion on the economic, social, and symbolic/ritual significance of these animals.

Lopez-Finn, Elliot (University of Texas at Austin)

[209] *"A Curious Ambivalence": The Iconography of Long-Distance Trade Goods in Postclassic Mexico*

The Postclassic Mexica maintained what Sophia and Michael Coe (2005) refer to as a "curious ambivalence" regarding cacao: despite its prevalence in everyday life as currency, the plant rarely appears in artistic programs and consumption was highly restricted via sumptuary laws that controlled social behavior. The visual scarcity of this crop extends into divine imagery—for instance, cacao remained an important aspect of Ek' Chuah, the Postclassic Maya merchant god, but does not appear among the connotations of his almost-identical Mexica counterpart known as Yacatecuhtli. This disconnection between visual versus economic consumption resonates with ethnohistorical evidence of an anxiety over cacao due to its luxurious and foreign nature—and by extension the larger tensions inherent in relationships with long-distance trade goods. In this work, I examine not only what foreign goods appear in the visual vocabulary of the Mexica, but the connotations of 'place' in their artistic contexts. In addition, I argue that the dearth of cacao iconography reflects larger tensions. As the Mexica expanded the boundaries of their empire in search of foreign products, the imperial artistic program broadcasts a complicated narrative of a people wrestling with identity in the face of increasing connections with far-flung places.

[120] *Fluted Point Variation in Glaciated Northeastern North America*

Recent syntheses for the adjacent glaciated regions of the eastern Great Lakes (EGL) and New England-Maritimes (NEM) document similar fluted point sequences associated with early and middle Paleoindian populations. Current consensus holds that these fluted biface sequences fall within a time range of 13,000–11,600 calendar years before present, and probably derive from Clovis populations (or their immediate descendants) that

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

colonized the glaciated landscapes of the Northeast from west and south. Here, we (1) discuss ongoing analyses of collections that provide additional insights on stylistic and technological variation through time in the glaciated Northeast, (2) draw comparisons with Clovis biface reduction sequences and forms, and (3) consider implications for the developmental relationships of these northeast fluted biface sequences to Clovis point technology.

Loubser, Johannes (Stratum Unlimited, LLC)

[113] *The Transformational Properties of Water and Rock Art*

Water helps breach the rock surface in both physical and perceptual ways. The addition of water facilitates the production of petroglyphs not only by weakening the bond between particles in sedimentary rocks but also with the moist particles acting as an effective abrasive slurry. The addition of water to natural earth pigment powder allows the colorant to effectively enter pores and interstices. Many virtually invisible petroglyphs and pictographs "magically" appear when covered with a thin layer of water. Southeastern Indians stood on damp surfaces or were partly submerged in water when producing petroglyphs. They also purified in rivers prior to major undertakings, such as producing or visiting petroglyphs. Numerous accounts mention these Indians entering the domain of spirit beings behind the rock surface through a waterfall or river pool. Some still believe that ocean and spring water are connected and practice rituals where ocean water is poured over a petroglyph boulder to animate its surface and to mix potent medicines from different realms.

[86] *Re-evaluating the Earliest Evidence for Wild Potato Use in South-Central Chile*

The earliest evidence of wild potato use anywhere in the world comes from Monte Verde (southern Chile), where tuber fragments were recovered from hearths that directly date to 14,500 cal B.P. Those tubers were tentatively assigned to a wild potato species (*Solanum maglia*) based on their starch granule morphology, which, according to Ugent et al., could be distinguished from the granule morphology of the domesticated potato (*S. tuberosum*). Recently, that identification has been called into question by Spooner et al., correctly pointing out that there is considerable variation in the size and shape of starch granules. This project extends this work by conducting a systematic study of starch granules from tuber reference materials of *Solanum* species that occur within a few hundred kilometers of Monte Verde. All reference materials were obtained from the USDA/ARS Potato Genebank and the International Potato Center and include *S. chacoense*, *S. kurtzianum*, *S. maglia* and *S. tuberosum* subsp. *andigenum*. We will present our approach to starch granule identification, clarifying whether the critical diagnostic features used by Ugent et al. allow with certainty an unequivocal assignment of the Monte Verde archaeological tubers to a single species.

Lovis, William (Michigan State University)

[215] *Landscape Marking, the Creation of Meaning, and the Construction of Sacred and Secular Spaces: Rethinking the Birney "Mound" in the City of Bay City*

The so-called "Birney Mound" on the Saginaw River in lower Michigan is revisited from the vantage point of long term landscape perception, marking, naming, and memory. The natural raised postglacial beach feature, a deposit of light sand, is the major landscape prominence on the Saginaw River drainage. At times during high water stands in the basin the location was the entrepot to the system from Lake Huron, and during later recessional episodes became the first highly visible landform encountered in upstream travel. The "mound" was employed for ritual purposes and cumulative mortuary behaviors for 5000 years. As recently as the late 18th century it harbored a Native American cemetery, and during the early 19th century it continued its prominent role of place as the site of major treaty negotiations. Such continuity of use reifies its status as a persistent place with attached and transmitted intergenerational information, and potentially transcending specific named ethnic/tribal groups; it is a cumulative historical space. This rethinking of the Birney "Mound" clearly situates the locale as a multigenerational landscape anchor point in indigenous knowledge and wayfinding systems.

[176] *Chiapa de Corzo: rutas de intercambio e interacción cultural entre las regiones zoque y maya*

Chiapa de Corzo se distinguió como una de las principales capitales zoques en la Depresión Central de Chiapas por casi dos milenios, hasta su abandono a finales del periodo Clásico. Su localización sobre una meseta elevada, que dominaba el valle del río Grande o Grijalva, resultó estratégica en el control de una de las principales vías de comunicación y transporte de recursos entre la costa y las tierras altas mayas. El sistema de comunicaciones asociado al río Grijalva constituyó el eje de una de las rutas de mayor importancia desde tiempos prehispánicos, con diversas conexiones fluviales y terrestres. La región destacó por su producción de cacao, maíz, algodón, ixtle, copal y otros productos vegetales, además de plumas preciosas y minerales apreciados, como la ilmenita, el caolín, la sal o el ámbar; asimismo, era la ruta de entrada para bienes foráneos sumamente valorados, como la obsidiana y la jadeíta, que llegaban desde el altiplano guatemalteco. El estudio de diversos contextos arqueológicos funerarios y rituales excavados en Chiapa de Corzo han aportado información fundamental para establecer la existencia de rutas de intercambio e interacción con el área maya desde el periodo Formativo Medio.

[79] *A Chesapeake Bay Paleoindian Legacy: Marine Transgression, Shoreline Erosion, and Archaeology*

The Chesapeake Bay at present encompasses approximately 4,479 square miles of estuarine water and it contains almost 12,000 linear miles of coastline. Numerous archaeological sites occur along the margins of the bay and its tributaries. Thousands of these sites are regularly threatened by the daily onslaught of wind and wave activity. The Delmarva Peninsula, which encompasses the eastern margins of the bay, has revealed approximately 350 Clovis-style fluted projectile points. Later and potentially earlier Paleo-American sites have also been discovered. Most of these sites and their associated assemblages have been found along the actively eroding shorelines of the peninsula. The purpose of this paper is to

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

highlight the natural coastal erosion threats observed at several Paleoindian sites and to offer simple solutions to address the loss of these important sites. A few of these rapidly disappearing sites have been partially investigated over the past 35 years and offer unique insights into regional Paleoindian adaptations.

[286] *The Works Progress Administration, Tennessee Valley Authority, and Geophysics: Bringing Together Digital Geophysical Data and Historic Excavation Results for Comprehensive Data Sets*

Under contract with the Tennessee Valley Authority (TVA), New South Associates, Inc. conducted comprehensive geophysical surveys of five Mississippian sites in the Tennessee River Valley between 2013 and 2017: the Bell Site (40RE1), the Cox Mound (1JA176), Hiwassee Island (40MG31), Ledford Island (40BY13), and Long Island (40RE17). The Works Progress Administration (WPA) conducted salvage excavations on all of these sites in the 1930's and the information available from their notes and limited reporting were the primary data sets used to study these sites prior to the geophysical survey. These notes and maps were often lacking detailed narrative and none of the maps could be georeferenced. The geophysical surveys expanded on these earlier data sets to survey the entire landscape, but comprehensive excavations could not be conducted. Combining the results from the geophysical surveys with those from the WPA surveys has brought the scanned legacy data into the digital world. The complementary data sets provide a more detailed understanding of each site's archaeology across nearly 100 years of research.

[335] *The Ramada Mortuary Tradition: At the Crossroads of Nasca and Wari in the Vitor Valley, Southern Peru*

In this paper, we discuss the mortuary tradition affiliated with the Ramada communities that inhabited the Vitor Valley of Southern Peru around 550 CE. Our field excavations in 2012 and 2015 revealed a long-standing tradition of mortuary treatment that persisted even after the arrival of the Wari in the area. While many components of this tradition appear to have originated locally, other components closely parallel Nazca populations, including patterns of trauma, funerary ritual and the presence of "trophy heads". The collective nature of the burials suggests the inclusion of both sexes, and all age groups. Interestingly, we have detected a form of secondary burial for neonates and infants. Our data suggest that many of them were not buried at the time of death, but rather at a later time, positioned next to adult women. In this context, we argue that the Ramada mortuary tradition in the Vitor Valley was part of a long-standing practice that remained remarkably unchanged despite co-habitation of the Valley with altiplano populations, and that promoted ongoing communication between the living and the dead. These collective burials may point to social and/or biological units that were perpetuated even after death.

[33] *Teotihuacan References Found within Classic Maya Inscriptions*

This paper explores Teotihuacan references found within the corpus of ancient Maya inscriptions. Classic Maya inscriptions analyzed for this investigation were derived from monumental architecture to ceramics. In the last decade more references to Teotihuacan within Classic Maya hieroglyphic writing have surfaced within the archaeological record and in museum collections. However, recently there has not been an in-depth study that analyzes the context of these recently uncovered references. First, this paper reanalyzes previous studies of the aforementioned topic. Second, it examines recent Teotihuacan references found within Classic Maya inscriptions which reveals new insights to the relationship that existed between the Classic Maya and the ancient city of Teotihuacan from Central Mexico.

[146] *Network Models for the Emergence of Transportation Infrastructures in Central Italy (1175/1150–500 BC ca)*

The period between the Late Bronze Age and the Archaic Age is a time of change and development in the Italian Peninsula, leading to the formation of the first city-states.

In this study, we focused on the Tyrrhenian regions of Latium Vetus and Southern Etruria, by analyzing the emergence of the network of terrestrial routes as it has been inferred from archaeological evidences. Our goal was to explore the mechanisms that shaped the overall structure of these past transportation infrastructures.

To this end, we designed network models corresponding to three competing hypotheses about the dominant mechanism underlying the creation of new connections. After comparing several synthetic networks generated by those models with the corresponding empirical systems, we obtained different outcomes for each of the two regions. In the case of Southern Etruria, the model simulating a simple form of cooperation was able to accurately reproduce all the relevant features of the network for the whole period under study. On the contrary, for Latium Vetus, each model could reproduce only some of the features at some of the ages. However, if we add a "rich get richer" bias to the cooperative model, its performance improved significantly.

[89] *Floors, an Archaeological Material: The Case of the Plaza de la Piramide del Sol, Teotihuacan, Mexico*

Human beings have modified surfaces to make them habitable, with time they made other floors to give it a better finish. The process was recorded in the floors interiors; we can observe the materials used in its elaboration and how they changed through time. Additionally, we can conduct other studies which help us understand the time-frame between structures. Floors are a complex material and their study helps us identify social aspects seen in

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

past studies of other materials such as ceramics, architecture, among others.

In this investigation we employed archaeomagnetic, chemical, geological, and six non-destructive physical analyses. Moreover, these studies were performed on fragments from three kinds of floor that correspond to distinct surface levels found in southern sector of Plaza de la Piramide del Sol, Teotihuacan during the 2014 excavation season.

Finally, we will present results gained from FTIR, XRD, and Raman analyses, from unconsolidated samples, SEM consolidated block sample studies against unconsolidated samples—as well as thin section findings. We will close by presenting archaeomagnetism dating results from which four construction periods were identified—as well as the benefits and drawbacks of using this methodology on a floor with the particular physical characteristics possessed by the analyzed Teotihuacan floors.

[187] *Faunal Exploitation Practices at the Steve Perkins Site, a Lowland Virgin Branch Puebloan Site Located in Southern Nevada*

To date, there has been little research conducted concerning the faunal exploitation practices of the Lowland Virgin Branch Puebloans in Southern Nevada. This project examines faunal remains from the multi-component Steve Perkins site, which was occupied from the Basketmaker II period (A.D. 400–800) to the Pueblo II period (A.D. 1000–1150). This project aims to provide insight into the subsistence strategies and exchange economies of the Lowland Virgin Branch Puebloans. By identifying the faunal remains, subsistence practices and exchange networks are evaluated. With transitions from the more mobile Basketmaker II period to the sedentary Pueblo II period, faunal assemblages are expected to shift to reflect the more sedentary lifestyle.

[213] *Introduction to the Intersection of Sustainability and Climate Change in Tropical Social Systems*

In 2015 world leaders adopted the United Nations 17 Sustainable Development Goals detailed in The 2030 Agenda for Sustainable Development. Recently, policy makers, archaeologists and other tropical scholars have been working with UNESCO Mexico, focusing on sustainability in tropical regions. One of the session discussants, Dr. Nuria Sanz, Director of UNESCO Mexico, has laid out the key aspects of particular important to tropical areas, resulting in the focus on five of the 17 goals: Goal 6—Ensure availability and sustainable management of water and sanitation for all; Goal 12—Ensure sustainable consumption and production patterns; Goal 13—Take urgent action to combat climate change and its impacts; Goal 15—Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss; and Goal 16—Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable and inclusive institutions at all levels. In this this paper, I discuss how archaeological data on ancient tropical societies can assist in devising strategies to address goals, with a particular focus on addressing the intersection of climate change and sustainability.

[172] *About the Reliability of Archaeological Information*

To study Mesoamerican architecture and urbanism, their graphic description is required. This description must be accurate, and it is traditionally expressed in coded and scaled drawings.

For decades, archaeologists have produced extensive documentation of their excavations, which institutional services in charge of the registration of monuments have supplemented to obtain complete inventories in order to support conservation and restoration activities. However, this material has been generated with recording methods where human intervention was important and indispensable to define quality. These data were then represented by line drawings and scaling of the initial measurements. Many times, the material that comes to us has been drawn, traced, digitized and printed. In other words, to the initial errors, many more were accumulated that diminishes the precision of the representation.

I will compare the quality of the information generated a few years ago with the documentation obtained from an aerial photogrammetry survey. I will develop the problem of human intervention in the registering vs. automated systems and the exhaustive representation vs. traditional planimetry. I will speak about the problem of reliability of data in order to share information in a wide digital context.

[67] *On Finding Smoke Town, a Late Eighteenth to Mid-Nineteenth Century, Rural Free Black Community Populated in Circa 1791 by Some of the 452 Manumitted Slaves of Robert Carter III*

This paper discusses the findings of initial excavation of a portion of the elusive rural free black community cartographically known as Smoke Town or Leeds Town, situated on the Shenandoah River, Warren County, Virginia. This community was populated by some of the 452 slaves manumitted by Robert Carter III by his Deed of Gift of 1791. Robert Carter III was an affluent grandson of Robert 'King' Carter. This Deed of Gift was the largest single manumission of slaves in America until the American Civil War—an event, of which few are aware. The excavated portion of Smoke Town dates from late eighteenth to the mid-nineteenth century. There are also prehistoric components to the site from the Late Archaic and the Early Woodland periods: An Early Woodland prehistoric hearth was found partially within the historic period fireplace and below the historic period chimney foundation. The physical evidence of the site is introduced and the excavation procedures and results used in the interpretations are presented. Discovery came as the result of two archaeological metal detecting surveys, reconnaissance and systematic. Excavations illuminate manners in which newly freed slaves of African descent conducted their lives, in contrast to plantation slave lifeways.

 [35] *Village Aggregation and Native Subsistence Practices at a Middle Woodland Mound Center, Gulf Coast Florida, USA*

Current research at Garden Patch (8DI4), a Middle Woodland mound center with circular village construction in northern peninsular Gulf Coast Florida, provide quantitative insights into the timing and temporality of monument construction and village aggregation. Here, we combine previously modelled radiocarbon assays with new isotopic data on season of collection and habitat of exploitation. The four-phase model of site occupation when combined with the new isotopic data provide new insights into the relationship between Native subsistence practices and rapid village construction events.

[83] *Multilayer Networks and Relational Plurality: The Scales and Sources of Social Capital across Southern Appalachia, A.D. 1150–1350*

The scale and structure of the relationships through which social capital is generated, amassed, and controlled must be understood if we are to evaluate the emergence and evolution of organizationally complex social, political, and economic institutions. At any one point in time however, actors or entities are undoubtedly embedded and engaged in a number of distinct, yet overlapping, relational fields. In this paper I interrogate three networks, representing three separate sets of relationships, situated at local, regional, and continental scales, to investigate the emergence of Etowah as a major sociopolitical center in the Southern Appalachian region of the southeastern United States. It is often posited that processes of Mississippianization are tied to shifts in political strategies towards those that emphasize exclusive relationships and the emergence of elite networks. While these extant narratives often focus on the actions of individual leaders or the characteristics of particular communities, this paper quantifies the actual scale and organization of these emerging relational structures and the effects of these structures on the distribution of social capital across Southern Appalachia. Using data on ceramic production and regional signaling behaviors I evaluate the plurality of network strategies through which different kinds of social capital were accessed.

[170] *Money and Inequality in Roman Mediterranean Gaul, ca. 125 B.C.–A.D. 100*

The Roman conquest of Mediterranean Gaul between 125–121 B.C. significantly altered the Celtic societies living in the region. Two of these dramatic transformations were the increasing use of coins in economic transactions, and a marked rise in socio-economic inequality within the conquered province. This paper examines the connections in Roman Mediterranean Gaul of the first century B.C. through the first century A.D. between the emergence of a monetized economy, debt, and increased socio-economic hierarchy, concentrating on the ancient settlement of Lattara (today modern Lattes in the région of Occitanie of France). Although coins, mainly from the Greek colony of Massalia (modern Marseille), were already present before the conquest, their use appears to have been limited. After the Roman conquest, the (at least partial) monetization of the local economy at Celtic settlements in Roman Mediterranean Gaul like Lattara significantly transformed notions of wealth and value, with a new interchangeability of wealth emerging. Combined with the colonial trauma of land confiscations and enslavement, this interchangeability of wealth allowed for the increasing concentration of wealth in an increasingly smaller number of individuals, holding ever more social power of others.

[337a] *Applying pXRF Technology to Repatriation at the National Museum of Natural History*

The Anthropology collections at the National Museum of Natural History (NMNH) have a long history of treatment with pesticides and contact with other materials that contain potentially hazardous elements. When the NMNH Repatriation Office began to use portable x-ray fluorescence (pXRF) technology, it focused on identifying potentially hazardous elements on archaeology, ethnology, and physical anthropology collections. If identified, the Repatriation Office attempted to determine the source of these elements, particularly from substances used and applied by the original makers and users of the objects and from substances applied during their curation. The Repatriation Office has since expanded the application of pXRF beyond hazardous materials testing, working with tribes to find new ways to address questions and meet their needs for and beyond repatriation. To date, pXRF has been used to assist in dating sites and human remains by analyzing metal alloys, to attempt to reassociate human remains with funerary objects, to reassociate commingled human remains, and to source artifacts and human remains. Many of these approaches have been undertaken at the request of tribes and have now been incorporated into the standard documentation process for all objects and human remains requested for repatriation.

[206] *Connecting Collections: The Ancient Americas in American Museums*

Museum collections resemble the tastes and character of the donors and curators that assembled them. This subjectivity lends them an idiosyncratic character. Nevertheless, the early network of dealers and donors connects many museums across the United States. Institutions like the Saint Louis Art Museum and the Denver Art Museum, for example, are linked through such relationships. This paper examines the history of such relationships and the manner in which collection histories may shed further light on the development of pre-Columbian art in the United States. Museums played an essential role in the popularizing of the Americas across the United States both through the growth of their collections and exhibitions. This paper will consider specifically the Denver Art Museum's (DAM) collection, and the role early directors and curators played in its development.

[250] *Assessing Variability in Toolkit Functionality: Differential Wear Patterns on Projectile Technologies from Late Pleistocene/Early Holocene Interior Alaska*

Much of the early theoretical framework for our understanding of the colonization and occupation of interior Alaska has been established on technological variability in lithic assemblages of the region. This initial research has been limited in scope, focusing on the presence or absence of microblades. Recent research has sought to push beyond the significance of debatably diagnostic tool forms, microblades, in defining cultural complexes and has attempted to more fully address models of behavioral variability including mobility, lithic landscape learning, seasonality, site-specific or prey-specific variability, and raw material constraints. Comprehensive inter- and intra-site use-wear studies represent a promising avenue for better understanding the functionality of important elements of lithic tool kits. This paper presents a morphological, macroscopic, and "low-power" microscopic usewear analysis of bifacial projectile points and microblades from 15 late Pleistocene/early Holocene sites located in interior Alaska

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

designed to more accurately define the functional roles and differential use of these technologies at an intersite and intrasite level. After establishing the functional roles of specific lithic projectile elements and point types, archaeologists can improve interpretations of late Pleistocene/early Holocene assemblage variability, especially as it relates to foraging behavior, landscape use, and site function.

[143] *We just need a few milligrams...*

Destructive analyses of human remains, i.e. analyses dependent on small biological samples from human, archaeologically found, bone or teeth, have yielded important new data and added to knowledge about our past. Yet, more studies generate even more studies, and the demand is clearly rising for more samples made available. This is especially the case for those collections, which are very unique in terms of geography (Greenland) or time period (Danish mesolithic). At the same time, these unique collections also represent a limited resource; it is doubtful how many more Greenlandic or Danish Mesolithic skeletons will be found in the future.

Aside several major studies on Danish prehistory, we have also undertaken exploratory "proof-on-concept and feasibility" studies, and methodological studies, comparing different sampling techniques. The presentation will focus on sampling techniques over the last twenty years, describe the rising curatorial awareness of the implications of sampling, including ethical considerations, as well as the results of our methodological studies.

[325] *Deciphering the Dairy Site: Settlement Dynamics and Early Hohokam Developments*

The Dairy site is a long-lived prehistoric locality situated at the juncture of the Tortolita Mountains piedmont and the Santa Cruz River floodplain north of Tucson, Arizona. Although the site has yielded important evidence of early Hohokam settlement and cultural developments, the sporadic nature of investigations, the lack of data from early fieldwork, and the destruction of significant portions of the site by the original Shamrock Dairy operation provide substantial challenges to understanding the occupational history and structure of this important prehistoric locality. Since 1999, archaeologists with Tierra Right of Way have investigated much of the locality and revealed extensive loci dating from the Tortolita through early Hohokam (Snaketown and Cañada del Oro) phases. This paper synthesizes previous and on-going research at the site to address the emergence of a local Hohokam tradition in this unique locality. We contrast early Hohokam cultural developments at the Dairy site with the plaza-centric village-based developments identified elsewhere by highlighting alternate agricultural strategies, settlement dynamics, and ideological and mortuary patterns.

[218] *New Perspectives on the Maverick Mountain Phase Roomblock at Point of Pines Pueblo*

Emil Haury's 1958 synthesis of the Pueblo III-Pueblo IV period (A.D. 1265–1450) archaeology of Point of Pines Pueblo, in east-central Arizona, is the US Southwest's classic case study in how to reliably infer ancient migrations. Field school excavations conducted between 1946 and 1960 uncovered compelling traces of immigrants from the Kayenta region of far northeastern Arizona and southeastern Utah. Noting evidence of a fire in the part of the pueblo referred to as the Maverick Mountain phase roomblock, and the rarity of Maverick Mountain Series pottery in deposits post-dating the conflagration, Haury concluded that the locals at Point of Pines burned these rooms in order to drive the Kayenta immigrants out. Recent research with the site's collections and their associated records has revealed indications of ritual architectural closure behavior similar to that documented at the Homol'ovi villages, a key indicator being enriched deposits. The nature of these deposits suggests that, rather than the locals, the immigrants set fire to the roomblock. In this paper, we describe this new evidence and consider the implications for understanding interactions between locals and immigrants at Point of Pines.

[45] *The Study of Isotopic Baseline in the Gan-Qing Region, Northwestern China*

We analyzed the baseline for dietary study through stable isotopes in the Gan-Qing (Gansu and Qinghai provinces) region in prehistory. Total 283 animal samples from 4 sites were collected and analyzed. We found that herbivorous $\delta^{15}\text{N}$ values did not change much in the Hehuang region between 3200 BCE and 2000 BCE, indicating that the range of nitrogen isotopic baseline was relatively stable in different time. The range of herbivorous $\delta^{15}\text{N}$ values from the Hehuang region around the 2000 BCE is from 1‰ to 6‰. The herbivorous $\delta^{15}\text{N}$ values from the Hexi Corridor varied from 2‰ to 10‰. This result shows that the nitrogen baseline in the Hexi Corridor was higher than that in the Hehuang region. It is probably related with the drought climate in the Hexi Corridor. The results indicate that isotopic baseline is particularly important for dietary research using stable isotopic methods in northwestern China.

[4] *Every Block of Stone Has a Statue Inside: Epipalaeolithic Engraved Plaquettes and Art at Kharaneh IV*

Artistic objects are thought to be one of the hallmarks of the Natufian period, marking a florescence of artistic behavior appearing prior to the origins of agriculture. However, with continuing research into Early and Middle Epipalaeolithic sites in the Levant, new discoveries of 'symbolic' artifacts are increasing our understanding of even earlier artistic and symbolic pursuits. In this paper we present an engraved plaquette from the Middle Epipalaeolithic context of Kharaneh IV, eastern Jordan. Using white-light confocal microscopy, we analyze manufacturing traces to identify the gestures and tools used to create the plaquette. This artifact, although the only engraved piece recovered from Kharaneh IV thus far, links into wider networks of Epipalaeolithic interaction and cultural exchange. Placing the Kharaneh IV engraved object into regional context with other Early/Middle Epipalaeolithic artistic artifacts, we explore wider networks of interaction prior to the Natufian.

[89] *Microanalytical Insights into Pigment Selection and Preparation in British Columbia Rock Art*

Pictographs are important archaeological locales that can provide insight into histories of mineral use and pigment preparation. We present the results of a series of microanalytical explorations of a pictograph panel at Boling Point, Babine Lake, British Columbia. Examination by high-resolution microanalysis (SEM-EDS, TEM, FTIR, micro-Raman) has revealed evidence pertaining to source selection of the iron-oxides used to produce the pictographs, the weathering and condition of the panels, and potential evidence for pigment enhancement by pyrotechnology. The pictographs at Boling Point were painted on an outcrop of argillaceous limestone covered in a kaolinitic weathering deposit. This natural canvas, and subsequent accretionary deposition, has aided in the long-term preservation of the panel. The pigment is composed of a homogenized mixture of ferrihydrite and hematite that was biogenically produced *ex situ*, most likely in a spring deposit, by aquatic iron-oxide producing bacteria, including *Leptothrix ochracea* and *Gallionella* spp. Preliminary results of high-sensitivity magnetometry also suggest that the pigment was thermally altered to induce iron oxide phase change to enhance colour properties. Our results demonstrate the potential of microanalytical applications in rock art studies, and have implications for pigment source selection, preparation practices, and decision-making in the placement of pictographs in British Columbia.

MacDonald, Douglas (The University of Montana)

[140] *Cougar Creek Obsidian: Quarry Activity and Secondary Processing of a Minor Yellowstone Obsidian*

The University of Montana conducted an archaeological survey of the Cougar Creek valley, Yellowstone National Park, Wyoming, in 2017. We mapped Cougar Creek obsidian outcrops, procurement areas, and secondary processing sites. XRF analysis of natural and cultural samples of the snowflake obsidian show a distinct chemical composition, even though its creation event is coeval with the famous Obsidian Cliff ca. 180,000 years ago (ca. 30 miles northeast). Due to its highly variable quality, Native American hunter-gatherers conducted extensive cobble testing prior to removal from the quarry area. They also mined pits and trenches to obtain the best quality material. A review of Yellowstone XRF-studies show use of Cougar Creek obsidian since the Paleoindian Period. There is a significant distance-decay reduction in its use, with local sites showing intense exploitation. In contrast, the material represents only ca. 1% of all XRF-sourced obsidian artifacts in the Greater Yellowstone Ecosystem. Thus, its significance lies in its use as a local source of stone, with little evidence of regional or national distribution such as occurs with the nearby Obsidian Cliff obsidian.

[136] *Walking into the Shadows in the Iberian Ritual Caves (6th–1st Centuries BC)*

The power of the underground has attracted ritual practitioners over the centuries. Natural places, such as caves, have some intrinsic sensorial power which helps to create a ritual atmosphere. In the Iberian Iron Age (6th–1st centuries BC), ritual production has been recognized in some caves through the identification of the material patterns, along with other physical and sensorial particularities. Although each cave is different, those cavities in which we find evidence of ritual practice have certain elements such as water, complete darkness or ritual memory. These elements are important to the performance of ritual activities, because they call up sensorial feelings. It is unlikely that the entire audience participated in the whole ritual process. Some practices, performed in the dark zones of the caves, would have been reserved for specific individuals based on class, age, and gender. In this paper I reconstruct ritual performances based on context and analyses of artifact assemblages.

[71] *Assessing the Correlation between Bone Artifacts and Body Part Profiles: A Case Study from the Central Anatolian Site of Kaman-Kalehöyük*

This paper investigates the production of bone artifacts during the Bronze Age (ca. 3000–1200 BCE) at the central Anatolian site of Kaman-Kalehöyük. At this time, small agrarian societies transformed into more complex polities and states, which gave way to a more centralized and specialized market economy. These transformations in sociopolitical and economic organization resulted in other changes as well. For example, animal exploitation patterns began to reflect a more regulated economy to meet food production, distribution, and consumption demands. Urbanized food management systems also had to meet the demands of craftspeople and specialists, if any, who might have preferred certain skeletal elements over others. In a rural site like Kaman-Kalehöyük, craftspeople, in particular, would use bone as raw materials readily and constantly available for production purposes. More specifically, we seek to elucidate whether preferences for specific bone elements reflect changes in the demands for consumer goods such as game pieces, jewelry, furniture inlays, archer's thumb rings, bone shaft looms, and needles. More broadly, we aim to test whether there are correlations between changes in sociopolitical and economic organization and production of bone tools through time.

MacIsaac, Heather (Indiana University of Pennsylvania)

[43] *Revisiting the Keeshin Farm Site: A Study on Continuity and Change in Subsistence Practices at a Langford Tradition Settlement*

The American Midwest served as a place for the exchange of materials and culture, and as the political center of North America by AD 800. The rise of the Mississippian polity of Cahokia altered the religious, political, and social structures of long-established Midwestern cultural groups in contact with Cahokia, including the populations of the Oneota and Langford Tradition settled along the Mississippi River and its tributaries. While Mississippian period (AD 900–AD 1500) artifacts have been found in Langford Tradition contexts, there exist conflicting views on the range and depth of Cahokian influence on these populations. A study of faunal remains associated with the Langford Tradition Keeshin Farm site in Rockford, Illinois, and comparison of results from similar sites reveal changes in subsistence as a reaction to influence from both Cahokian and Oneota sources. Analysis of the Keeshin Farm faunal assemblage includes measuring dental wear patterns, determining seasonality for hunting, and identifying processing techniques for *Cervus canadensis* (wapiti), *Odocoileus virginianus* (whitetail deer), and other mammals commonly used for food. Keeshin Farm results are then compared to those at Hotel Plaza, Gentleman Farm, and Zimmerman sites in Illinois to provide further insight into continuity and change in Langford Tradition subsistence.

[43] *What Are the Chances? Estimating the Probability of Coincidental Artifact Association with Megafauna Remains*

There has long been a debate about the frequency of megafauna hunting or dismemberment by early Paleoindians in North America. Proposed megafauna kill sites are heavily scrutinized. Sites which contain limited artifacts, but no projectile points are often discounted or classified as 'possible' kill sites due to their limited cultural materials. This begs the question, just how likely (or unlikely) are artifacts to be accidentally associated with megafauna remains? Using a computer model, the likelihood of accidental cultural association with animal remains (in this case proboscidean) can be estimated. In the model proboscidean remains and archaeology sites were realistically distributed on a landscape using variables from predictive modeling and the modern proboscidean ecological record to understand the frequency of coincidental spatial associations. While no computer model can exactly replicate real world circumstances, this analysis allows for a base understand of the frequency and most common circumstances which produce accidental archaeological associations. This model viewed alongside the archaeological record establishes another basis for evaluating possible megafauna kill or dismemberment sites.

[262] *Household Ritual and the Development of Complex Societies in Formative Mesoamerica: Comparing the Maya Lowlands and Central Mexico*

Recognizing that households contribute to—rather than simply reflect—broad social changes, scholars working in the Maya lowlands and Central Mexico argue that domestic ritual played a role in the emergence of complex societies in Formative (or Preclassic) Mesoamerica (c. 1000 BC—AD 300). Certain aspects of household-level, ritualized activities are shared across Mesoamerican cultures. However, major differences within and between the two regions show that a variety of social organizations were constructed and transformed over the course of the Formative period. The site of Ceibal, in Guatemala, provides key data for understanding the social processes that took place in the Maya area. Along with public rituals, early domestic practices influenced the development of very different kinds of city-states that would characterize the Maya lowlands and Central Mexico during the subsequent Classic period.

[40] *Agricultural Strategies and Intensification: A Study of Risk Management in the Southern Maya Lowlands*

The decisions and consequences behind the intensification of agricultural strategies among past societies has long been a topic of debate among archaeologists. These discussions are often dominated by factors of population dynamics and production capacity. This paper will explore the less discussed factor of risk management. Controlling the variation of production in regard to fluctuating natural and social pressures was critical to past agrarian societies and undoubtedly played a role in the development of their intensive agricultural strategies. This is addressed by examining the geo-intensive agricultural strategy of the ancient Maya located in the hilly region of the North Vaca Plateau, Belize. The GIS modeling of a combined assemblage of datasets that include archaeological fieldwork, remote sensing (LiDAR), pedological analysis, and climatic reconstructions reveals the functional qualities of the agricultural terracing that forms the basis of the production strategy in this region. Results present the properties of terracing in relation to hydrological flow and erosion as well as their ability to increase land suitability for production by decreasing variation in the face of climatic fluctuations. Identifying the functional qualities of this intensive agricultural strategy will demonstrate an intentional action to ameliorate the risks experienced in the North Vaca Plateau.

[141] *Sea Shells in the Mountains and Llamas on the Coast: The Vertical Economic Organization of the Paracas in Palpa, South Peru (370–200 BC)*

This research analyzes excavated materials of the Paracas culture (800–200 BC) in southern Peru, particularly obsidian artifacts, malacological finds, and camelid bones. In doing so, different methods including archaeometric techniques, quantification, artifact classification, and species determination are combined to elaborate natural origin, making, distribution, and utilization of the objects. The Paracas remains were excavated by the Palpa Archaeological Project and mainly derive from three representative sites situated at distinct altitudes on the western Andean slope: Jauranga (285 masl), Collanco (1,630 masl), and Cutamalla (3,300 masl). Accordingly, the Late Paracas period (370–200 BC) in the Palpa valleys (Andean Transect) serves as a case study for this archaeoeconomic approach.

The results show exchange processes in the western Andes that are characterized by unbalanced commodity flows. Resources from the highlands such as obsidian, camelids and their products—for instance wool—arrived at the Pacific desert strip in large amounts, while marine resources such as sea shells reached highland regions only in small amounts. Raw materials were not just procured in the mountains, there were also strategic production centers like Cutamalla. All in all, consumption at coastal settlements like Jauranga needs to be seen as the driving force behind the Paracas economy.

Madrid González, Mariela Viridiana (Universidad Veracruzana)

[93] *El diseño de la actividad. La relación de los petrograbados y los talleres de lítica en la Costa este de Los Tuxtlas*

La Zona Costera del volcán de Santa Marta, al este de Los Tuxtlas, cuenta con la presencia de afloramientos basálticos que fueron aprovechados de diferentes maneras desde el Formativo medio hasta el Clásico tardío. En esta zona, han sido identificado contextos arqueológicos de explotación que corresponden a talleres dedicados a la producción de artefactos de lítica tallada y pulida. Una característica de algunos de estos talleres, es la presencia de petrograbados, algunos con diseños sencillos, algunos con diseños complejos. En este trabajo, se analiza la relación espacial de las áreas de producción, los petrograbados y los elementos del paisaje para establecer si existe una relación entre los diseños plasmados y la actividad realizada en los talleres.

[34] *(Almost) Making It in the Margins: Medieval Norse Adaptation to the Arctic Fjord Environments*

The medieval Norse settlements in Greenland formed the westernmost frontier of Scandinavia, and the Old World, between ca. AD 980–1450. A Norse society of perhaps only some 2500 farmer-hunters settled two subarctic niches: the Eastern Settlement in South Greenland with ca. 550 sites and the smaller Western Settlement 500 km north in the inner parts of the Nuuk fjord region and with only some 90 sites. For still not completely understood reasons, the latter was completely abandoned by AD 1350–1450, the former a generation or two later.

This presentation reports the preliminary findings of two coupled projects that attempt to recognize key drivers of Norse settlement change and deterioration: Winter is Coming Project (WiCP) and Comparative Island Ecodynamics in the North Atlantic Project (CIE). WiCP investigates agriculturally marginal areas to understand Norse settlement and land use dynamics in settings highly susceptible to climatic. CIE compares the ecodynamics of long-term societal development in Iceland/Greenland. However, rather than reveal new clues to Norse settlement decline in Greenland, the two projects have over the last 5 years demonstrated more examples of successful adaptation, complex settlement dynamics, and societal change in agriculturally marginal fjord areas that offered the Norse other opportunities.

[116] *Evidence of Pre-Columbian Polyculture and Agroforestry in the Eastern Amazon*

The scale of pre-Columbian impact on Amazonia is one of the most debated topics in archaeology and paleoecology. To address this issue, an interdisciplinary approach combining archaeological soil profiles and lake sediment cores from the lower Tapajos are used to investigate climate-human-ecosystem interactions over the past 8,000 years. Pollen and phytolith data indicate the presence of polyculture crops including *Ipomea*, *Manihot*, *Zea mays*, and *Cucurbita*. The presence of Theobroma, Mauritia/Mauritiella, Myrtaceae, Brosimum, Attalea, Lecythydaceae (Bertholletia), and Caryocar suggest the exploitation of naturally occurring trees of economic importance. Pollen, phytolith and charcoal data do not document large-scale pre-Columbian deforestation at this site. The presence of polyculture, trees of economic importance, and rainforest vegetation suggest Formative Pre-Columbian populations (ca. 4000 cal yr BP) employed diverse subsistence strategies that combined forest and fire management, polyculture and soil amelioration that maximized subsistence diversity without large-scale land clearing. These data provide evidence of resource diversification, improved food security, and sustainable anthropogenic landscapes during increased climate variability and expanding pre-Columbian populations in the late Holocene. This provides an example of long-term example of sustainable anthropogenic landscapes that can inform management and conservation efforts for sustainable futures of Amazon ecosystems in the 21st c.

[58] *The Ecology of Cooking with Firewood*

Cooking food conferred an energetic advantage to our pre-human ancestors and became one of the hallmark characteristics of the human strategy set. Accessing fuel remains a common problem for many human societies. Yet anthropologists do not often take the costs of gathering fuel into account when modeling subsistence and settlement. This paper presents a model that incorporates firewood tradeoffs into human choices about what to eat and where to live, and examines a hypothetical case for the North American Great Basin. Applications of this model in both archaeological and modern ethnographic contexts will allow anthropologists and ecologists to illuminate firewood-mediated relationships between people and woodlands.

[127] *Late Pleistocene Aggregation Sites on the Peruvian North Coast: A New Look at Paján Settlement*

Although specific examples are rare, the concept of seasonal or periodic group aggregation is often employed by studies of early foragers in the Americas as a functional process to explain the formation of social networks, information exchange, group ritual, exogamy, and the long-distance movement of materials. In spite of frequent use when modeling mobility and settlement, the material, spatial, and social characteristics of aggregation sites remain poorly understood. Here, we provide two examples of aggregation sites related to the Late Pleistocene-Early Holocene Paján complex of northern Perú. These early foragers occupied an ecotonal boundary zone along the western Andean foothills, which afforded access to the nearby Pacific coastal plain and adjacent highlands. Paján settlement organization has been characterized as primarily logistical, with small task- or resource-specific locations and basecamps located in proximity to resource-rich zones. Two large sites (Je-431 and Je-790) in the Río Seco de Chamán drainage provide evidence for and insights regarding the aggregation process, as well as Paján social organization. We contend that these sites primarily served to organize communal foraging parties, as well as nodes for the exchange of information and materials.

[58] *Contemporary Archaeology in Indigenous Communities?*

This presentation critically evaluates both the historic and present trajectories of the field of ethnoarchaeology and its outgrowths as practiced in indigenous communities today. This paper draws on long-term fieldwork conducted amongst two distinct communities who inhabit Arctic Europe and east Africa. I reflect upon the development and current state of ethnoarchaeology—often used as a tool to interpret archaeological remains of the deep past—and suggest new potential functions and responsibilities for the subfield.

Maher, Lisa (University of California Berkeley) and Danielle Macdonald (University of Tulsa)

[295] *Becoming Neolithic or Being a Hunter-Gatherer? Reframing the Origins of Agriculture through a Longue Durée Perspective*

Searching for the origin points of major cultural revolutions and transitions has long been a driver of archaeological research, yet led to research focused on perceived boundaries, rather than continuity. Research into the origins of so-called modern human behavior, the origins of social complexity, the earliest domesticates, among others, all focus on defining moments of change that may be undetectable in the archaeological record. Perhaps some of the most enduring archaeological questions revolve around the 'origins of agriculture'. In this paper, we explore changing historical conceptions of the 'origins of agriculture' in Southwest Asia in archaeological discourse and how, through the lens of the *longue durée*, we can trace aspects of material culture, human action, and complex human-landscape dynamics in deep time. Using examples from the Epipalaeolithic of eastern Jordan, we address current debates on Neolithization by exploring the implications of perspectives that focus on 'becoming' Neolithic and 'being' a hunter-gatherer. Through this perspective we discuss different scales of material culture analysis; from the 'ethnographic' lens identifying individual behaviors in the past, to the *longue durée* of material culture trends. This multi-scalar perspective gives new insight into how we construct cultural boundaries and understand change during the 'origins of agriculture'.

[135] *Sustainable Heritage through Community Engagement and Education*

In addressing the problem of burning libraries, this paper focuses on sustainable heritage through public awareness and civic engagement. Political rhetoric and limited first-hand experience has created a system whereby the impacts of climate change, coastal erosion, and rising sea levels are no longer a priority; and for students, it has become but a distant concern. This paper addresses these problems through education programs designed to (i) get students involved in the archaeology of coastal sites, (ii) help students better understand their own heritage and preserve it; and (iii) encourage students to take an active part in maintaining their landscapes, environments, and heritage through civic engagement projects. This approach has been successful in our study regions; and preliminary results are presented here.

[331] *What Did We Learn? SAA's Discovering the Archaeologists of the Americas Pilot Project*

SAA has an ambition to investigate the demographics of the archaeological profession in the Americas, looking to bring together knowledge and advice on how the profession of archaeology (in cultural resource management, academic, government, museum, self-employed, and other contexts) is structured throughout North, South, Central America, and the Caribbean. SAA has now carried out the first step toward this goal, which has been to carry out a targeted pilot project, gathering data on archaeological employment in two test areas—Chile and New Mexico. Doing this has allowed us to test the proposed methods and to obtain feedback on processes in order to learn about how the full study could ultimately best be conducted.

[255] *The Materiality of Feasting: Pottery as an Indicator of Ritual Practice in Late Woodland Virginia*

The Hatch site in Prince George County, Virginia is arguably among the most significant precolonial sites in the region. After it was excavated in the 1980s, the collection was stored away and went largely unstudied for the last thirty years. When I first began my research on this 'orphaned' site, I was struck by the large pit features containing evidence of ritual feasting and a wide variety of ceramic types. Adhering to the old trope that 'pots equal people', I initially assumed that this site was one in which different groups aggregated for rituals that increased social bonds, eventually helping them coalesce into the Algonquian groups encountered by the first English colonists. As my research progressed, I came to realize that the ceramic varieties are more indicative of the ritual practice itself than they are of different groups of people. Hatch is a site that appears to be of great ritual significance to the Late Woodland people of coastal Virginia. The artifacts found in the site's pit features, including Abbott Zoned Incised—an elaborately decorated ceramic ware—strongly suggest this. This paper presents my research into these ritual practices and my thoughts on the significance of the ceramic types associated with them.

Makowski, Krzysztof and Roberto Pimentel (Warsaw University)

[211] *Skilled Craftsmen, Ancestors Cult, and Hegemonic Strategies of the Wari Empire*

The comparison of new evidence obtained from Pachacamac and Castillo de Huarmey sites sheds new light on the character of Wari presence on the Peruvian Coast. Both sites are contemporary (Late Middle Horizon, ca. 800–1100 AD) and most new information comes from funerary contexts. In both cases, imitations of foreign styles, originated in the south coast and highlands, as well as the local ones are present in the iconography found in the offerings. Recent analyses lead us to the conclusion that most artifacts were locally produced by local and foreign artisans, except for rare portable items such as wooden artifacts and textiles. Additionally, the character of the iconography corpus does not correspond to the hypothesis of the existence of Wari religious proselytism since the local traditions prevail in the forms and possible iconography content known from both sites. Rather, the presence of an imperial power with hegemonic character manifests in the reorganization of production, symbols of power, and in the diffusion of new funerary paradigm.

[207] *Ayllu There in the Upper Marañón? Founding Ancestors and Political Dynamics in the Rapayán Region of Ancash/Huánuco during the LIP*

Andean scholars generally conceive the ayllu as representing a group of people who consider themselves to be related by common descent and who collectively possess and exploit resources (land and water). In many regions of the Andes during late pre-Hispanic times, ayllu members retraced their common origin and kinship ties through the celebration of a mummified founding ancestor. Ayllus could either be small or large and often the smaller units were hierarchically integrated into the larger ones. As result, ayllus tended to be nested and multi-scalar social organizations where an individual could be linked to a hierarchy of ancestors. In this paper, we seek to determine whether the largely farming communities of the Rapayán region of the Upper Marañón during the LIP (1000–1450 C.E.) displayed a social organization characteristic of the ayllu or not. Through excavated evidence and the analysis of architectural forms and spatial distribution, we are able to infer the existence of hierarchy of founding ancestors as well as some of the water and farming lands exploited by their descendants.

[9] *Reconstructing Recipes: Stable Isotope Analysis of Food Residues from a Year-Long Cooking Experiment*

Charred food residues provide a unique window into ancient peoples' culinary cultures, and chemical analyses of burnt meals can help us identify the ingredients used to create specific recipes. However, limited experimental work leaves us wondering—when we find residue in an ancient pot, are we viewing the remains of the final meal cooked in that pot or is it the product of multiple recipes? Does the chemical signature of the residue accurately reflect the meal(s) cooked in that pot? Seven archaeologist-cooks each prepared a distinct recipe, in the same ceramic (un-glazed) pot, once a week for a year, and periodically sampled the charred residues for stable isotopes of carbon and nitrogen. During the final weeks, the cooks swapped recipes to see if the final meal would “over-write” the previous year’s cooking events, or if the chemical signature of those earlier meals would be retained. Our isotopic data show a consistent relationship to each recipe’s ingredients. However, the isotopic data from the final residue collection indicate the charred material was not only from the last recipe cooked but retained material from earlier cooking events. Therefore, archaeologists are cautioned in interpreting charred pottery residues as they potentially reflect multiple meals.

Mallios, Seth

[258] *Archaeological Ceramic Analysis as a Vehicle for Anthropological Holism at 1607 James Fort: An Essay in Honor of Dr. Joseph W. Ball*
Joseph W. Ball spent a highly successful and influential career identifying archaeological insights into the Maya through detailed, rigorous, and creative ceramic analyses. In honor of his many contributions, this paper draws on Dr. Ball’s methodological and theoretical approaches by using ceramics as a springboard for deeper anthropological discussions into daily life at Jamestown Island, Virginia during the first half century of English settlement (1607–1657). Distinctions in artifact frequencies between Fort-Period and Post-Fort Period features uncovered by members of the ongoing Jamestown Rediscovery Project are consistent throughout nearly every artifact type are most pronounced among ceramics. Expanding the analysis from a core dimensional focus on space, time, and form to broader thematic issues of diachronic trade patterns and intercultural exchange laterality, this presentation identifies key nuances in exchange directionality and economic inequity that reflected the deterioration of English/Powhatan Indian relations during the first quarter of the 17th century. Drawing in other subfields of anthropology in a holistic manner—another cornerstone of Joe Ball’s research—it becomes clear that the sequence from bilateral intercultural exchange to unilateral intercultural exchange to no exchange at all was not only a barometer of failing relations; it was a catalyst as well.

[80] *Household Resilience, Political Collapse, and Community Transformation: Late-Terminal Classic Transition of the Ancient Maya Center of Xuenkal*

Across the Maya Lowlands, the Terminal Classic Period (AD 800–1000) represented a time of dramatic sociopolitical transformation. Investigation of the Northern Maya lowland site of Xuenkal, shows an abrupt break in the pattern of steady demographic growth during the Terminal Classic, associated with the center of Chichen Itza 45 km away. Xuenkal presents a unique case to evaluate this transition as it contains discrete households associated with the Late Classic zenith of local political centralization as well as Terminal Classic constructions associated with Chichen Itza Sotuta materials. Comparisons between the two groups show differing strategies of household socioeconomic integration. This presentation explores the local transformation from the perspective of both polity and household as outside pressures disrupted longstanding trends. Finally, the patterns of household and political transformation are compared and contrasted with the case of Copan, Honduras.

[182] *The Contributions of Vance T. Holliday to the Earth Sciences*

Vance T. Holliday, the recipient of SAA’s 2018 Fryxell Award for Interdisciplinary Research, has devoted his career to applying geoscientific methods and theories in archaeological investigations. Vance’s scientific contributions, however, go beyond archaeology; he has played an important role in facilitating our understanding of landforms, sediments, and soils that provide the context for archaeological sites. The sites he has investigated, with a focus on their geomorphology, soils, stratigraphy, and paleoenvironmental records are in a variety of landscape settings. Those settings include playas, draws, river valleys, dune fields, and loess-mantled uplands. Through decades of research, he has been instrumental in developing our knowledge of late-Quaternary landscape evolution, soil genesis, and especially soil stratigraphy. Against the backdrop of Vance’s long and productive career as a geoarchaeologist, this paper provides an overview of his contributions to the Earth sciences.

Manin, Aurelie (University of York), Camilla Speller (University of York), Gregory Pereira (CNRS, UMR 8096 Archéologie des Amériques) and Christine Lefèvre (MNHN, UMR 7209 Archéozoologie Archéobotanique)

[43] *Captive Birds and Pet Keeping in Ancient Mesoamerica: The Case of Scarlet Macaws from Vista Hermosa (Tamaulipas, Mexico, 1300–1500 AD)*

In Mesoamerica, the tropical colourful birds were highly valued for their feathers. Among them, the scarlet macaw (*Ara macao*) provided bright red, blue and yellow feathers that were traded to the Central Mexican Highlands and, beyond Mesoamerica, until the American Southwest. As suggested by ethnohistoric records, some birds may have been maintained in captivity and harvested to supply the demand in feathers. In spite of examples of large-scale macaw management in the American Southwest, there is no such archaeological evidence for Mesoamerica, and in particular within their native regions. In this presentation, we investigate the osseous remains of two scarlet macaws from the Postclassic site of Vista Hermosa, Southern Tamaulipas, Mexico (1300–1500 AD) to clarify their relationship with the Huastecan population. Using osteological markers and stable isotopes, we show that the birds were kept in captivity, maybe as pets. By identifying captive birds outside of the major political centres of Central Mexico, these results shed new light on aviculturist practices in ancient Mesoamerica. In addition, the archaeological evidence of captive macaws in the Huasteca is consistent with ethnohistoric observations, and could help to understand the origin of the captive-reared scarlet macaws found in the American Southwest.

[143] *Differential DNA Preservation in Archaeological Dental Calculus and Dentin Has Implications for Ancient Microbiome Research*
Ancient DNA (aDNA) studies of preserved microbiomes from dental calculus and paleofeces shed light on the evolution of these complex microbial communities, as well as both human health and behavior in the past. Despite recent advances in the recovery and authentication of aDNA, environmental contamination and inconsistent molecular preservation remains a continuous concern. Recent studies suggest that dental calculus may provide a better preservation environment for DNA than other archaeological materials, yet this hypothesis has not been systematically tested. In this study, we adopt a non-targeted shotgun approach to analyze the preservation of microbial and human DNA in 48 paired dental calculus and dentin samples from archaeological contexts. These represent a broad spatial and temporal breadth and thus contribute to a better understanding of DNA preservation in dental calculus independent of burial context, age of the sample, and depositional environment. Our investigation demonstrates that dental calculus offers a robust preservation environment for endogenous microbial DNA. In addition to the strong microbial signal, calculus consistently contained low amounts of human DNA, and thus may serve as an appropriate source of DNA for analyses of archaeological materials stemming from environments less conducive to molecular preservation.

Mann, Evan

[35] *Conch, Whelk, or Clam: Comparing Southern Florida's Indigenous Shellfish Collection Patterns*

The populations of southern Florida are an exemplary case of indigenous groups who organized into large political entities without the advantages of agriculture. This is due to the populations' close proximity to vast amounts of marine resources. Among these resources, many shellfish (both gastropods and bivalves) were used not only for nutritional sustenance, but also made up an important proportion of the tool industry, and as trade goods between these local populations and those at a distance. This work discusses and explores shell-midden artifacts to reconstruct the collection practices of two large populations, the Calusa and the Tequesta, as well as another smaller group inhabiting the Florida Keys, the Matecumbe. Results indicate significant variations in collection practices, despite the three groups sharing territory in the southern area of the Florida peninsula and having access to similar marine resource habitats. This methodology holds great potential to better understand the relative importance of different marine resources among the populations of southern Florida.

Mann, Rob (St. Cloud State University), Charles Peliska (St. Cloud State University) and Jacob Dupre (St. Cloud State University)

[39] *"A Very Good and Substantial Fort" or "More like a Child's Playhouse": The History and Archaeology of Civilian Fortifications during the U.S.—Dakota War of 1862 in Minnesota*

In August 1862 long-simmering tensions between the Dakota and Euro-American traders, settlers, soldiers, and government officials boiled over into open warfare. For nearly two months militant Dakota warriors, ostensibly under the leadership of renowned chief Little Crow, attacked Euro-American settlements and military installations. In response, settlers across southwest and central Minnesota either fled the region or attempted to fortify their settlements. These so-called "settlers' forts" of the U.S.—Dakota War of 1862 are today a largely unexplored part of Minnesota's archaeological record. To date, no comprehensive archaeological survey has been undertaken to locate and document these frontier fortifications. These civilian fortifications, some constructed in a little as twenty-four hours, ranged from imposing fortresses to little more than makeshift barricades. The U.S.—Dakota War of 1862 was a seminal event in the history of Minnesota. Although relatively unknown outside of the state, the impacts of the U.S.—Dakota War of 1862 are far-reaching and ongoing in many Minnesota communities, both Native American and Euro-American. This paper details historical and archaeological research on civilian fortifications at Fair Haven, St. Cloud, Sauk Centre, Paynesville, and Forrest City by graduate students and faculty at St. Cloud State University.

Mantha, Alexis (Champlain College, Saint-Lambert)

[264] *Different Dead for Different Purposes: The Ancestors and Ancestral Spirits of Rapayán in the Peruvian Central Andes*

During the Late Intermediate Period (1000–1450 C.E.), the inhabitants of the Rapayán region in the Peruvian central Andes created a complex landscape for the dead. These were disposed of in natural caves along cliffsides surrounding residential sites as well as in a variety of above-ground mausoleums constructed at highly visible locations. In this paper, I develop a typology of sepulchres and analyze their spatial patterning. Building on ethnographic and ethnohistorical material, I argue that the different types of mortuary constructions and their specific distribution across the Rapayán landscape reflected different kinds of mortuary programs. On the one hand, rituals honoring the dead located in caves and smaller mausoleums grounded people in place and participated in the construction of group identity. I suggest that the deceased in this funerary program became ancestral spirits and were likely commemorated as an anonymous collectivity. On the other, rituals celebrating the deceased placed in tall multi-story buildings distributed at the top of hillside embodied political competition among kin groups and were ultimately used to legitimize power. I suggest that the deceased in this funerary program became ancestors and were celebrated as the named founding ancestors of kin groups.

[333] *Images of the Living Past: 19th-Century Moche Archaeological Photographs and Everyday Indigeneity in the Northern Peruvian Andes*

This presentation analyzes late 19th-century photography of Moche pre-Columbian buildings, as a way to inspect the buildings' incorporation into everyday indigenous lives. I will focus on the work by German scientist Hans Heinrich Brüning (1848–1928). First arrived as an engineer hired by the most important sugar haciendas of the region, Brüning's interests quickly shifted towards archaeological and ethnographic studies during his stay in the Northern Peruvian Andes between 1875 and 1920. His work was mainly focused on pre-Columbian Moche buildings and in contemporary indigenous Moche populations, to the extent that his photographs are the earliest documents of its kind. In this presentation, I will explore how Brüning's images prove how these buildings were part of contemporary indigenous roads, religion and labor; and how this incorporation defined scientific understandings

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

of indigeneity in this Andean region. In this sense, Brüning's images are relevant as they serve as ethnohistorical documents, as well as given that they substantially explain the trajectories of archaeological sciences in this Andean region. Finally, I explain how the meaning these images communicate is key to understand 20th-century and present uses of these photographs by Moche descendants.

Marcucci, Derrick (Landmark Archaeology, Inc.), Susan Gade (Landmark Archaeology, Inc.) and Antonio Martinez Tunon (Landmark Archaeology, Inc.)

[239] *The VerHage Site: A Late Archaic Seasonal Village located in Walkkill Drainage of Southeastern New York*

In summer 2017 Landmark Archaeology, Inc. conducted data recovery excavations at four Late Archaic sites in southeastern New York within the Walkkill drainage near the town of Goshen. Excavations at the VerHage Site, a Late Archaic Lamoka Phase (ca. 3000–2500 BC) site and the largest of the four investigated sites, identified pit features, post-molds and house patterns, yielded a large lithic assemblage, and found glacial erratics used for food processing and tool production. The recovery of a large number of formal bifaces and groundstone tools as well as the presence of massive roasting pits indicate that hunting and processing of wild plant foods were tasks undertaken at the settlement. By comparing the density and diversity of the VerHage artifacts and features with those of the other three sites, we interpret the site functioned as an aggregation center seasonally occupied by regionally interacting kin based bands.

Marcum-Heiman, Alesha (University of Louisiana, Monroe) and Diana Greenlee (University of Louisiana—Monroe)

[156] *Beyond the Boundaries: Systematic Survey of the Poverty Point Landscape*

The monumental core of Poverty Point (16WC5) has been the focus of considerable archaeological research, particularly since the early 1980s, but the broader spatial context of the site is less well known. Indeed, it has been estimated that < 12% of the Poverty Point Compatible Use Zone (PPCUZ), a nearly 5-km radius catchment area around the site, has been formally surveyed. The PPCUZ, which was established for management purposes, approximates the daily foraging radius for hunter-gatherers in a resource-rich environment. In 2017, the Poverty Point Station Archaeology Program initiated a systematic investigation of the PPCUZ. Working with volunteers and local landowners, a siteless survey approach is used to acquire data necessary to characterize past uses of the PPCUZ landscape. This poster presents the results of the first season of investigation and preliminary observations regarding patterns of land use and settlement in the area immediately surrounding Poverty Point.

[166] *What Would Larry Do: Archaeological Practice with, by, and for Native American Communities*

The fight for inclusion of Native Americans in archaeology and anthropology hasn't been an easy road; it has been divisive, contested, and sometimes violent. The need for allies and advocates for Native American inclusion in the field has become apparent through the tireless work of Larry Zimmerman. His scholarship has shaped generations of archaeologists and anthropologists in numerous ways. The ethical dimensions of his work are a testament to the need for change in the field and are a reminder that archaeologists must work within the field to push boundaries and move beyond what is considered 'fact.' In this paper, I discuss the implications of Larry's scholarship and practice on my own work as an Indigenous archaeologist, ways that we can better engage his approach and lessons learned, and ways that we can contribute to the breadth of knowledge created by Larry J. Zimmerman for the benefit of Indigenous peoples.

Marengo, Nelda Issa (University of California Riverside)

[33] *Warriors and Violence in the Iconography of Chichén Itzá*

En Mesoamérica las representaciones gráficas sobre guerra, violencia y conflicto, son una constante que se encuentran en diversos sitios y en diferentes periodos. Para el Epiclásico (650–900 A.D) en el centro de México, y para el Clásico Tardío/ Terminal (600–900 A.D) en el área Maya, esta temática comienza a presentar cambios, tiende a ser más explícita y a compartir algunos elementos entre sitios contemporáneos. Chichén Itzá floreció durante este momento de cambios y muestra de ello es la presencia de dichas características en la iconografía plasmada en la arquitectura y en la pintura mural del sitio, así como en los distintos artefactos encontrados en excavaciones arqueológicas. Estas representaciones gráficas han sido motivo de diversas lecturas e interpretaciones. Mediante este trabajo busco contribuir a su entendimiento desde una perspectiva en donde se puedan observar las dinámicas sociales inherentes en los eventos bélicos incorporados en la iconografía de Chichen Itzá.

[31] *Commercialization, Consumption, and Political-Economic Strategies in Late Postclassic Mesoamerica: A Comparative Study of Access to Projectile Points at Tlaxcallan and Santa Rita Corozal*

Over the course of the Postclassic Period (A.D. 950–1521), commercialization was on the rise in ancient Mesoamerica, reaching its apex at the time of contact with Europeans. Extant information indicates that both interregional trade and regional market integration increased during this time, especially during the Late Postclassic (A.D. 1250/1300–1521). Yet, researchers have little comparative published information on household consumption from well-excavated residential contexts for this period. In this paper we compare access to formal lithic tools (projectile points) at two Late Postclassic sites with differing governing structures: Tlaxcallan (located in Central Mexico), and Santa Rita Corozal (located in coastal Belize). Specifically, we investigate the degree to which political-economic factors affected production and access to projectile points, including the accessibility of non-local raw materials used in their production, and their distribution among various households. We test whether households with differing social statuses monopolized or controlled finished points, and if the raw materials used to produce them varied among households on the basis of status. Finally, we consider the degree to which these patterns correlate with differing political-economic strategies employed by governing officials at the study sites.

[48] *Towards a Wave-of-Advance Model for Predicting the Spread of Prismatic Blade Technology in Mesoamerica*

The diffusion and spread of material culture is a cornerstone of archaeological research, particularly understanding the variables which dictate the structure of dispersal. Recent evolutionary approaches have sought to address technological spread through mathematical modeling. One model, the reaction-diffusion model, suggests diffusion occurs at the population scale as a wave-of-dispersal. While previous researchers demonstrated the efficacy of this approach regarding the peopling of a landscape, there remains a need to demonstrate how the model can shed light on the spread of ideas. In this study, we seek to test if the dispersal of prismatic blade technology throughout Mesoamerica occurred as a wave-of-dispersal. Our first

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

objective is to create a database containing the variables required for analyzing the wave-of-advance. Next, we developed general rates at which we predict ideas to have spread based on ethnographic data. Finally, we analyzed the database information and the predicted rates together, testing the validity of using a wave-of-advance model to predict the spread of blade technology. The results enable us to better understand technological change and exchange relations in Mesoamerica. By generalizing the results we can engage in larger theoretical debates such as the relationship between the development and transmission of ideas.

Marken, Damien (Bloomsburg University)

[80] *Classic Maya Urban Settlement Dynamics: Planning and Mobility Introduced*

Following decades of debate, most scholars accept Classic Maya cities as the hearts of spatially expansive, low-density urban settlements. This introductory paper will summarize past and current perceptions of Maya urbanism, emphasizing potentially overshadowed considerations of urban planning, mobility, and community dynamics—fundamental cross-cultural features of urbanization—and their detection in lowland settlement patterns. The recent florescence of research deriving insight from urban theory has been positive as it reminds scholars that Maya cities were urban phenomena, not simply political capitals, and must be treated as such. But the trend to emphasize monumentality in urban layout continues, to the near exclusion of other processes critical to urbanization, such as mobility, neighborhood community building, and resource management. There is a strong need for increased residential excavations across Classic urban landscapes, and we should be prepared to develop audacious programs following recent LiDAR surveys. Maya urbanism was a complex mesh of social, economic, ritual, and political networks, balanced between potentially conflicting household and social group loyalties, resulting in changing urban structures through time and space. It will require a long-term disciplinary commitment to household and neighborhood excavations to fully uncover the temporal and regional dynamics of Classic Maya urban systems.

Markert, Patricia (Binghamton University)

[58] *A Tale of Two Places in D'Hanis, TX: Combining Linguistic Anthropology and Historical Archaeology to Study Place-Making on the Texas Frontier*

In this paper, I discuss an archaeological approach to place-making that incorporates elements of linguistic anthropology, drawing from narrative analysis and Bakhtin's chronotope to analyze oral histories from a small town in southwest Texas. D'Hanis originated as an Alsatian colony on the Texas frontier, one of four settled by empresario Henry Castro in the 1840s. By the 20th century, the town had not simply transformed but moved—the railroad had caused a rupture in the settlement that resulted in an “old” and “new” D'Hanis, two competing towns with the same name approximately a mile apart. Today, few structures in Old D'Hanis remain, while New D'Hanis retains the aesthetic of a western railroad town. Archaeologically, this paper examines the spatial and material strategies that residents used to create two places out of one. Narratively, it examines how the town narrates a sense of place in the past and present. This paper aims to explore how we, as archaeologists, might approach the intersections of material and narrative strategies in our studies of place. Further, it suggests that linguistic anthropological methods and theories offer opportunities for historical archaeologists to better understand how people create and maintain places in space and through time.

[89] *Copper Smelting in the Early Bronze Age Aegean*

Our understanding of Early Bronze Age copper smelting in the Southern Aegean has improved dramatically in the last two decades through a combination of fieldwork, laboratory analyses and experimental reconstructions (Betancourt 2006, Bassiakos, 2007, Pryce 2007).

The currently accepted model for primary copper production has been largely based on the outcome of an experimental campaign (Pryce et al. 2007). While this study accepts the value of experimental archaeology it challenges the current model and the specific manner in which the “Aegean perforated furnace” is used. The new study has implications for ideas of resource perception and establishing the techno-typology for early copper metallurgy in the region.

These implications are discussed within the context of the early transmission of metallurgy across Eurasia and the diversity of early technologies. The Aegean region is shown to be a critical location for providing a perspective on the specifics of transmission.

[35] *Cooperation and Coercion: Geography, Ecology, Climate, and Surplus Production in the Rise of the Calusa Kingdom*

The Calusa of southwest Florida were the most complex and powerful society in Florida during the sixteenth century AD. They relied for protein not on agriculture, but on aquatic resources harvested from shallow-water estuaries. Our interdisciplinary team is exploring the evidence for surplus production and intensification against a background of environmental challenges and opportunities. We focus on Mound Key and Pineland, the two largest Calusa towns. We think that cooperative heterarchical relations among coastal and inland polities gave way to coercive hierarchical relations after ca. AD 1000. Major canals, large midden-mounds, and fish-capture/storage facilities were constructed following a ninth-century hiatus during a challenging period of global cooling known as the Vandal Minimum. The succeeding Medieval Warm Period ameliorated the productivity of the shallow-water estuarine environments around Mound Key and Pineland, providing new opportunities. We think that certain leaders were able to mobilize surplus labor to construct canals, maintain and rebuild structures, procure resources from faraway mainland forests, and coordinate and oversee the engineering of “watercourt” structures that probably functioned as fish traps and/or fish storage areas. We interpret this commitment to place as a way that successive members of a lineage transmitted political and social capital.

[306] *Mortuary Analysis of St. Joseph Sanatorium, Albuquerque, New Mexico: A Multidisciplinary Approach*

In 1984–1985 several sets of human remains were inadvertently discovered at St. Joseph's Hospital in Albuquerque, New Mexico. These remains were excavated by the University of New Mexico and the Office of Contract Archaeology. In all a total of 12 individuals were excavated from this previously forgotten cemetery. St. Joseph's Hospital was established by the Sisters of Mercy in 1902 as a tuberculosis sanitarium for well-heeled clients to rest and recuperate in what was then thought of as one of the healthiest cities in the United States. Sanitariums like St. Joseph were established throughout the New Mexico territory to attract more wealthy individuals to settle the territory and finally make their bid for statehood stick. Initial analysis of skeletal, dental, and funerary data seems to partially contradict this model that has held for the role sanitariums played in late territorial New Mexico. Of the individuals whose dental morphology could be analyzed, most (5/8) were of Hispanic ancestry, and at least two individuals (2/8) were of African American ancestry. Coffin hardware and funerary artifacts were uniform and indicative of middle- or lower-middle-class socioeconomic status. These data suggest a more nuanced view of tuberculosis treatment during the late territorial period.

[135] *The Follo Railroad Environmental Monitoring Project in Medieval Oslo, Norway*

In conjunction with a large urban infrastructure project, renewing the Norwegian railroad through the listed monument of the Medieval town of Oslo, an environmental monitoring programme was established. The Medieval town consists of extensive archaeological remains preserved in situ. The monitoring programme focusses on the following questions: What is the influence of building an encased railroad next to a medieval monument? How are the unsaturated conditions influenced next to the new railroad? And how does such a large urban infrastructure project affect the preservation conditions of the archaeological deposits in the unsaturated zone further inside the monument? This paper presents the archaeological setting, the installed equipment and monitoring plan as well as the first results of the long-term monitoring that started in 2016.

[92] *Trends in Paleoindian Projectile Point Technology during the Pleistocene-Holocene Transition at the Old River Bed Delta, UT*

The fossil Old River Bed delta, located in the Great Salt Lake Desert, UT, contains one of the highest concentrations of Paleoindian archaeology within the Great Basin. Occupied from 13,000 cal B.P. until its desiccation around 9,500 cal B.P., this productive marshland provided a wide array of dietary resources utilized by the region's inhabitants during the Pleistocene-Holocene transition. However, changes in climate, local hydrology, and human populations during this dynamic period likely substantially altered the distribution and relative abundances of these resources. Here we analyze a large sample of projectile points from the delta's distal portion to examine how hunting technology and behavior responded to this hypothesized shift in dietary resources. We propose that the observed trends of decreasing point size and manufacture investment through time are the result of Paleoindian hunters increasingly targeting smaller prey species (*Odocoileus hemionus*, *Ovis canadensis*, *Antilocapra americana*) as larger prey went extinct (*Mammuthus*, *Bison antiquus*) or decreased in abundance (*Bison bison*).

[40] *A Relationship between Seasonal Flooding and Raised Agricultural Fields in the Llanos de Mojos, Bolivia*

The Llanos de Mojos, Bolivia, a seasonally flooded savanna region in the western Amazon lowlands, has several types of artificial landscape modifications that point to a significant pre-Columbian occupation with some approximately as old as 500BCE. These earthworks include 40–50,000 raised fields which were used as a regional-wide agricultural technique to grow a variety of crops. This paper focuses on the relationship of these fields to their hydrological environment. Using GIS in conjunction with digitized data from the Proyecto SIG Arqueológico del Beni and the Dartmouth Flood Observatory at the University of Colorado this paper analyzes large-scale regional variation in the presence of flood water and the placement of raised fields within distinct hydrological constraints. It is suggested that their construction is associated with the amount of nearby regional flooding that is the result of topographical, geomorphological, and riverine relationships. These separations can be seen along distinct intraregional lines, dividing the denser fields in the northern part of the Llanos from the less dense southern section. By focusing on these kinds of seasonal hydrological distinctions, the results demonstrate that crop cultivation may have relied on the placement of raised fields to facilitate water management.

[209] *Stepping Out: The Maya Underworld and the Red Temple at Cacaxtla*

The murals of Cacaxtla, Tlaxcala, have long thrown the issue of Central Mexico-Maya interaction into high relief. There we find the richest evidence of interaction between these two cultural zones, though whether this amounts to citation, appropriation, fusion, or immigration is open to debate and contestation. This paper re-examines the stairway murals of the Red Temple for what they tell us about a Maya world seen through a Central Mexican lens. A particular focus falls on the link between image and physical space in these paintings, which make them experiential as well as visual.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Martin, Stephanie (University of Arizona)**[12]** *Least Cost Path Analysis of Maritime Routes in the Ancient Aegean*

The Least Cost Path analysis in ArcGIS has been a critical tool in archaeological reconstructions of movement and connectivity, but until recently these analyses have been limited to land travel. From the Neolithic onwards, sea travel was an equally important mode of transportation in the Aegean and wider Mediterranean. In this study, I utilized the Least Cost Path tool in ArcGIS to model sea travel in the Aegean.

Bathymetric data and speed and direction of local wind and currents were inputs in a Least Cost Path analysis which examined sea routes of man-powered vessels in the Aegean Sea. Using May averages to approximate optimum sailing weather and known Bronze Age port cities, a surface raster was created from scaled bathymetric data and a cost surface raster was based on current speed and direction and wind speed and direction. The application of a Least Cost Path analysis for sea routes successfully modeled maritime routes around the Aegean for a man-powered vessel. The model can be improved with future research and the creation of a specific sea travel cost algorithm, and incorporating sailing parameters.

Martin, Worthy (IATH, University of Virginia), Carrie Heitman (University of Nebraska) and Paul Reed (Archaeology Southwest / Salmon Ruins)**[130]** *The Salmon Pueblo Archaeological Research Collection (SPARC) Project : Making the Data Accessible*

Supported by the National Endowment for the Humanities, the Salmon Pueblo Archaeological Research Collection (SPARC) Project was initiated in 2015 by the Center for Digital Research in the Humanities at the University of Nebraska Lincoln, the Institute for Advanced Technology in the Humanities at the University of Virginia, Salmon Ruins Museum, and Archaeology Southwest. The primary goal of the SPARC Project is creation of an online digital archive of materials from excavations at Salmon Pueblo in the 1970s. The finished archive will contain more than 15,000 scanned images (photographs, maps, drawing), roughly 30,000 pages of scanned original Salmon field forms, and a portal allowing access to more than 250,000 lines of data from dozens of Salmon databases. SPARC will be go live on the Internet in mid-2018. The variety of archaeological methods: discovery and recording, applied to the Salmon Ruins site over the years present interesting challenges for creating an internet accessible archive of the discoveries at this important "Outlier" to the primary Chacoan great houses. In part, this paper will discuss the implementation of IIIF for both documents and images, divergent epistemologies with regard to object/image data and metadata, and the ethical and political issues involved in this project.

Martindale Johnson, Lucas (Far Western Anthropological Research Group Inc.), Daron Duke (Far Western Anthropological Research Group Inc.), Jennifer DeGraffenried (U.S. Army Dugway Proving Grounds) and Bruce Kaiser (U.S. Army Dugway Proving Grounds)**[154]** *Examining Handheld XRF Inter-instrument Variation: A Collaborative Project Using a Large Assemblage from the Great Basin*

Collaborating with multiple XRF instruments enables larger than normal datasets to be analyzed in a short period. The portability of instruments is important to analysts working together in one location as groups of specimens can be analyzed simultaneously. However, certain protocols must be followed so there are no discrepancies among instruments. We present our project's methodological controls, such as shared source library and calibration, and preliminary results. The study consists of over 6,000 obsidian and fine-grained volcanic artifacts from Paleoindian assemblages from western Utah's Old River Bed delta. We demonstrate that inter-instrument variation is insignificant within our regional context when all analysts follow strict instrument controls.

Martinez, Desiree (Cogstone Resource Management)**[166]** *Oh Captain, My Captain: Transforming the Practice of Archaeology*

For many Native American community members, becoming an archaeologist can be a difficult choice. This is especially true if you have witnessed the wanton destruction of your sacred sites, the disrespectful treatment of your ancestors by archaeologists and have been taught by your family and community to see archaeologists solely as grave diggers. My review of the archaeological literature and interaction with archaeologists during the 1990's only supported this perspective, bringing doubt to my ability to successfully enter an unwelcoming discipline. However my introduction to Larry Zimmerman's writings such as "Made Radical by My Own" and "Sharing Control of the Past" was a ray of hope to me; that a non-archaeologist understood and fought for the inclusion of Native Americans and their perspectives in the practice of archaeology. This presentation will describe how Larry Zimmerman has helped transformed archaeology into a more inclusive one through his scholarship, support and mentorship of not only the author but other Native American archaeologists and cultural practitioners.

[131] *Comcaac Collaborative Ethnohistory: The Importance of Objects, Places, Routes and Leaders*

In collaboration with Comcaac community members of Sonora, Mexico, oral accounts are combined with archival documents and with archaeological survey. For the colonial period in Sonora, historians and anthropologists have mostly relied upon archival documents written by representatives of the Spanish empire, in addition to information from historical archaeology. The Comcaac knowledge immersed in oral traditions balances some of the inherent biases in the Spanish documentary record, and sheds light on aspects of their history where the documents are mute. Initially we describe Comcaac historical accounts about the "Cazoopin" (Spaniards) that mention first encounters with Spanish sailing ships and their opportunistic adoption of Spanish material culture. We then discuss the relevance of place and routes among the different historical narratives. To finalize with a discussion on how, both Comcaac oral accounts and the documentary record, provide ample descriptions of leaders. It is argued that the importance of Comcaac masculine war leaders is a cultural practice similar in some respects to Spanish and Western emphases on prominent individuals. Through collaboration multiple spatial and temporal configurations documented in our research provide unique insights into the role of subject/object-place relationships and practice in cultural continuity, tradition, and cultural transformation.

[89] *A New Methodology for Understanding How Bone Wears Using 3D Surface Texture Analysis*

Use-wear analysis provides a tool for studying traces produced on animal bone during manufacture and use. Often, these analyses have been qualitative, describing the surface two-dimensionally, and have led to inconsistencies between researchers. Studies have focused on interpreting final traces and lack a foundation in understanding how the traces developed. Here, we propose a new methodology for studying bone surface traces that will reduce the problems of unreliable and unreplicable results in more traditional qualitative analyses. We seek to understand the basics of use-wear formation over time by incrementally taking impressions of bone specimens subjected to a controlled, mechanical experiment. Our study assesses how bone wears during extended use on three materials (leather, fresh hide, or bark), starting from three modification states (unmodified, modified by flint or by sandstone). 3D surface texture analysis is used to quantitatively measure various features of bone surfaces, such as surface roughness [Sa], peak curvature [Sp_c], autocorrelation length [Sa_l], and lower material ratio [Smr₂]. This novel quantitative and experimental approach, which focuses on the incremental process of use-wear formation, will enhance our understanding of the use of bone as a raw material and can be directly applied to archaeological materials and questions.

Marwick, Ben (University of Washington) and Erik Gjesfjeld (McDonald Institute for Archaeological Research, Un)

[103] *Modelling the Innovation and Extinction of Archaeological Ideas*

The history of archaeology is often told as a sequence of prominent individuals and their publications. Due to the focus on big names and big papers, the diversity of archaeological publications is often underestimated. Here we introduce a quantitative method that illuminates historical trends in archaeological writing by investigating a large number of journal articles. We use a Bayesian framework developed for estimating speciation, extinction, and preservation rates from incomplete fossil data. We model archaeological ideas within this framework by equating citations of archaeological literature to occurrences in the fossil record. We obtained reference lists for 12,000 journal articles published between 1977 and 2017 and explored the chronological distribution of cited papers to identify periods of innovation and extinction. We discuss how our modeling approach helps to quantify the diversification of archaeological publications and our broader understanding about the history of archaeological thought.

[203] *A House Divided: John Brown's Birthplace and the Path to Freedom*

On December 2, 1859, John Brown was hanged following his conviction for murder, slave insurrection, and treason resulting from his raid on a federal arsenal in Harpers Ferry, Virginia two months prior. Brown anticipated and hoped that his actions might spur a rebellion that would spread throughout the South bringing freedom to all enslaved persons. To some people he was a murderous lunatic; to others he was a martyr for the abolitionist cause; and, to many he was a hero whose actions sparked the onset of the Civil War. Brown was willing to commit such extreme acts, including the deaths of his two sons because of his belief that slavery should be abolished at all costs.

Following his execution, John Brown's birthplace in the hills of northwestern Connecticut became a pilgrimage destination for those who revered the man and the principles he championed. Although the house itself was destroyed by fire in 1918, the site has remained a destination for sightseers and admirers and is now a Connecticut Archaeological Preserve. In order to better understand Brown's motivations, one must examine his early life and the people and ideas that that most influenced him.

Mastran, Chuck (John R. White Community Archaeology Association)

[274] *Excavations at the Springfield Furnace, Mercer Co., PA, and the Euro-British Charcoal Iron Technological Tradition in America*

An archaeological field investigation, inaugurated by John R. White of Youngstown State University in 2007, ultimately revealed the remains of an antebellum, single tuyere, charcoal iron blast furnace located in Mercer County, Pennsylvania. The facility, originally called the Seth and Hill Furnace, is presently known as the Springfield Furnace by locals. The configuration, constructed generally of heavy ashlar and rubble detritus, is listed historically as utilizing heated air, or 'hot blast' (Lesley 1859:108). Hot blast was a technical innovation in the 1830s geared to economize on time, labor, and fuel and thus increase iron production. Revelations include the discovery of an intact hearth-forehearth locus associated with a preserved tuyere embrasure that is capped by an integrated, protective iron tuyere box within the base of the hearth proper. Further, an intact "Staffordshire" type water-cooled breast was discovered. The untimely passing of White in 2009 created a vacuum for his students and volunteers from all walks of life. The group of dedicated field technicians created the John R. White Community Archaeology Association to continue this important work. The present report is an attempt to educate a potential readership about 'lost worlds' in their own back yards.

Masucci, Maria (Drew University)

[141] *Pottery Rituals and Ritual Pottery: Ceramic Production, Use, and Disposal among the Guancavilca of Coastal Ecuador (AD 800–1532)*

The Colonche Valley of coastal Ecuador represents an east-west corridor as well as the apex of north-south interconnected valleys. Hilltop sites of the Manteno-Guancavilca (AD 800–1532) have been reported across the high flat ridgetops of these valleys since the early 20th century. Recent comparative analysis of surface vessels at newly discovered sites in the eastern Colonche Valley demonstrates the coalescence of examples of all types found at sites throughout the valleys. Mineralogical and elemental analyses in conjunction with raw material sourcing and formal and contextual analyses of the ceramic component provide a window into ritual practices, societal transformation, and intraregional interaction. Preliminary results suggest that the formal and paste variants represent sub-regional or community distinctions and that the sites in the eastern Colonche Valley may have represented a social and ritual confluence. The ceramic analysis and results are contributing to interpretations of the way in which social and ritual practices were central as part of and contributing to societal reformulations across a broad landscape of southern coastal Ecuador, culminating in what is known as the Guancavilca cultural phase. The vessels represent the unique communities but their presence together represents the ethnogenesis of a broader community identity.

Masur, Lindi (University of Toronto)

[86] *Food Production in the Borderlands: Paleoethnobotanical Investigations of the Western Basin Tradition in Ontario*

This paper presents the results of a paleoethnobotanical analysis of the early Late Woodland (A.D. 1000–1300) Western Basin Tradition (WBT) sites informally known as the Arkona Cluster. Relatively little is known about WBT human-plant interaction as compared to their maize-bean-squash cultivating Iroquoian neighbors. Culture-historical models of the WBT are proving to be outdated, overemphasizing the supposed difference between WBT 'hunter-gatherer' subsistence strategies and Iroquoian farming. Recent isotopic analyses have suggested archaeologists have been underestimating the amount of maize consumed among the WBT peoples at this time, and limited excavation and botanical analysis has hindered the revision of our understanding of their subsistence practices. Plant remains from the Arkona Cluster sites, however, show WBT peoples were indeed cultivating maize, calling into question our conceptualization of their food production, landscape construction, and mobility. Paleoethnobotanical methods were employed to elucidate plant-human interaction of these culturally-distinct peoples residing at the periphery of Iroquoian territory and influence. This paper will present macrobotanical data from flotation sampling, as well as micro-fossil (starch grain) data from ceramic and groundstone residues to provide more meaningful cross-cultural comparisons of food production during the early Late Woodland period in Ontario.

[33] *Fang & Feather: The Origin of Avian-Serpent Imagery at Teotihuacan and Symbolic Interaction with Jaguar Iconography in Mesoamerica*

The Central Mexican city of Teotihuacan rose to prominence in the last century BC and lasted for six centuries. The civic plan was arranged around two main perpendicular avenues lined with temples and public monuments. By the third century AD, the population was housed in apartment compounds. On the walls were murals depicting ornately dressed administrators, armor-clad warriors, and fantastic creatures. These murals were the birthplace of the Feathered Serpent. My research proposes that the Feathered Serpent of Teotihuacan was a new deity serving as a symbol of the city; conceived in direct opposition to the jaguars used to symbolize kingship in contemporary Mayan polities. Past studies have treated the murals of Teotihuacan as either literal representation of supernatural deities or as a set of signs to be translated like a language. This study concludes that there is an intermediate interpretation wherein the feathered serpent is both a god and a symbol of identity. This is found in the representations of Teotihuacanos outside of Teotihuacan and outsiders within the barrios of Teotihuacan. Thus, Mesoamerican states not only foregrounded concepts of community identity, but also actively recognized those of other polities they came into contact with.

[131] *Moho Rising: Sixteenth-Century Battlefields, Lived Lives, and the Creation of Archaeological and Historical Frameworks that Work*

For more than 170 years, archaeologists and historians have offered a range of arguments in an attempt to locate the site of the 1541 siege of Moho. Although historical records of the Vázquez de Coronado entrada provide tantalizing clues about the whereabouts of this major battle, generations of scholars have often used an odd amalgam of description, assertion, and evidence to postulate the geographic location of this significant historical site. Carroll Riley's interest in the deep history of the American Southwest and Mexican Northwest—like Bandelier, Hodge, Kidder, Hewett, and others before him—intersected with this persistent question. The definitive identification of Moho, and the reasons that has now become possible, would have interested him intensely. Assembling the archaeological and historical evidence to not only position Moho in space, but locate it in an historiographic milieu of ideas, and in social fabric of sixteenth-century Native-European interactions, are the primary goals of this discussion. The paper emphasizes the value of three key components in constructing successful analytical approaches to the Early Historical Period and addressing the rich veins of

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

complexity inherent within it, including: nested scalar analyses using archaeological and other multivariate data, wide-ranging comparison, and thick prediction.

Mathews, Jennifer (Trinity University)

[173] *Taming the Maya Jungle: Decauville Railroads in 19th and Early 20th Century Yucatán*

Starting in the nineteenth century, industries like henequen, chicle, hardwoods and sugarcane required the installation of narrow-gauge railroads across the Yucatán Peninsula. Mules, horses or people pulled low and flat, four-wheeled wooden carts along these rails, which connected haciendas, ports, and remote jungle camps. These rails brought supplies from “civilization” or commodities out of the forest for distribution. This paper will explore the role that railroads played during this period. For the elites who ran commodity industries, Decauville rails were part of the modernizing infrastructure used to “tame” the jungle and speed up labor production. For the workers, the rails were laid atop stone roads built by their ancient ancestors, along jungle paths that their families had walked centuries, or through agricultural fields on lands formerly theirs. They were a tool used to exploit labor in a brutal process of forest and agricultural extraction for global commodity consumption, and a symbol of their loss of property rights, resources and the ability to feed their own families. And yet, in some cases, the rails that traversed into the forest allowed Maya workers to be away from the watchful eye of managers, hidden away in the untamable forest.

[195] *Range Limits: Semi-feral Ranching in Spanish Colonial Arizona*

In North America, the introduction of livestock as part of the Columbian Exchange had profound social and ecological consequences for indigenous communities. Historical ecology offers a holistic landscape approach to a phenomenon that archaeologically has often been viewed through shifts in diet and butchering practices. This study examines the creation of range practices at Spanish colonial Mission Lost Santos Angeles de Guevavi, near what is today Nogales, Arizona. Using multiple lines of evidence, this paper proposes a set of indicators to identify semi-feral ranching in both the archaeological and historical record. Isotopic evidence shows that semi-desert grasslands were most affected by the introduction of cattle and sheep. Faunal and historical analyses suggest cattle ages were loosely monitored, and animals were culled at an older age than optimal for meat and grease extractive strategies. These findings indicate a low investment strategy, which may have helped indigenous groups maintain traditional agricultural and gathering practices, augmenting their resilience in the colonial period. Finally, this paper explores how semi-feral cattle ranching was sustainable under historical conditions, but has since become an ecologically and politically problematic practice in the modern American West and used to justify U.S. federal interventions without community consultation on reservations.

Matsumoto, Mallory (Brown University), Andrew Scherer (Brown University) and Omar Alcover (Brown University)

[163] *Fortified Capitals: Understanding Defensive Systems at Piedras Negras and Yaxchilan*

Prior reconnaissance efforts in the Middle Usumacinta River region have identified a series of low walls associated with Tecolote, La Pasadita, and other border sites in the Yaxchilan kingdom. Similar defensive features have also been identified at the Piedras Negras secondary center of La Mar. These walls are interpreted as the foundations for wooden palisades, and served to protect not only immediate communities, but also the kingdom at large. However, this paper presents the first evidence that Piedras Negras and Yaxchilan, the polity capitals, were fortified as well. Walls near both sites have been identified through survey, and defensive features at Piedras Negras have been excavated to better understand their chronology, construction, and function. Moreover, recent work at the Late Preclassic site of Macabiler, located in the southern reaches of the Piedras Negras kingdom, highlights the deep temporal depth of fortifications in the region. These findings suggest a broader, regional tradition among Maya communities of using the landscape as an instrument in political interactions, and encourage incorporation of the natural environment into studies of Classic Maya politics.

[299] *Architecture of Pre-Columbian Northeast Honduras*

In 2017, the postclassic settlement of Guadalupe on the north-east coast of Honduras revealed remnants of wattle and daub (bajareque) constructions. This was an important finding as information on precolonial architecture in north-east Honduras has been scant, due not only to the low number of archaeological investigations in the area, but to the use of highly perishable materials in these constructions. Despite this, recent ethnographic reports have provided indispensable information about colonial-era materials and traditions. This paper examines the archaeological record of Guadalupe along with archaeological, ethnohistoric and ethnographic reports to examine what viable information can be retrieved on precolonial architecture in north-eastern Honduras. It reviews a range of architectural findings discovered through archaeological investigations, and offers a comparative analysis with findings from adjacent (predominantly southern) regions where traditional construction techniques are still commonplace today. This research stands to reveal new and valuable information about the construction techniques, traditions and architectural history of Guadalupe.

Matthew, Laura and William Fowler (Vanderbilt University)

[275] *Yet Another Tale of Two Cities: Santiago en Almolonga and San Salvador in the Early Sixteenth Century*

The first Spanish foothold in Guatemala took root during the first invasion of Guatemala led by Pedro de Alvarado in 1524 at the Kaqchikel city of Iximche. Historians regard this as the first capital of Santiago de los Caballeros de Guatemala. After its location at Iximche, Santiago had two sequential locations near Olintepeque and in Chimaltenango. The ruins of the first permanent Santiago de Guatemala, founded in 1527 in the Valley of Almolonga and destroyed in 1541, lie beneath the modern village of San Miguel Escobar. An indigenous town of several hundred resettled Mexican auxiliaries and their families located in the village of Almolonga or “Ciudad Vieja,” grew up about two kilometers to the west. The acta de fundación of Santiago implies a grid-plan layout, but we know almost nothing of the spatial organization of these centers since they lack detailed archaeological investigation. We know them primarily through extensive historical research. In contrast, San Salvador, founded by an expedition from Santiago in 1528, also known archaeologically as “Ciudad Vieja,” has been the subject of detailed archaeological investigation as well as historical research. Contextual comparisons between these two closely related early Spanish colonial urban centers has proven very useful.

Matthews, Christopher (Montclair State University)

[201] *Ethnography, Routine Archaeologies, and Social Justice Research*

As the organizers of this session argue, understanding the ethics of engagement in archaeology is maturing rapidly and we are reaching the point where our community engagements are no longer self-evident. Rather we increasing understand that they need interrogation and critique, and this needs to be an embedded part of our routines. This paper will argue that knowing the nature of our engagements requires a deep ethnographic reading

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

of the contexts of our research and the multiple roles it plays in the communities we engaged in our research. This approach draws from the transcendental empiricism described by Deleuze, such that what we do in becoming engaged, even in the most routine way, requires consistent analysis of how those we engage with come into view and why they become open to collaboration. Such an analysis is the basis of ethnographic archaeology, or the effort to understand how archaeology is and can be an agent in the communities we work with. I illustrate this approach in a review of my engagement with the Native and African American community in Long Island, New York.

[115] *Ornaments from Room 28, Pueblo Bonito*

In the late 1890s, the Hyde Exploring Expedition collected over 650 finished ornaments from Room 28 in Pueblo Bonito. UNM's recent re-excavation of the room, including material derived from backdirt from adjacent rooms as well as intact floor and subfloor deposits, produced thousands of additional ornaments and pieces of lapidary debris. This paper presents the results of the analysis of this combined assemblage and discusses its significance in relation to ornaments found in other portions of the structure. Importantly, this study finds that Room 28 contains high frequencies of specific types of ornaments most associated with specialized depositional contexts. More specifically, the Room 28 assemblage is characterized by the co-occurrence of ornament forms and materials that otherwise distinguish high-status burials (particularly Room 33) and kiva offerings.

[153] *Old Collections and New Approaches: Estimating Mast Resource Use in the Lower Pecos Canyonlands of Southwest Texas*

Baker Cave is a dry rock shelter with exceptional organic preservation in the Lower Pecos Canyonlands of southwest Texas. The site is best known for high floral and faunal diversity in a Paleoindian-age hearth excavated in 1976, the first of three seasons (1976, 1984, 1985) the Center for Archaeological Research (CAR) worked at the site. Only those 1976 excavations have been reported in any detail. This poster summarizes analyses to estimate mast resource use over time at Baker Cave based on samples from the 1984 and 1985 collections, curated at CAR. Field notes for the most recent excavations are currently unavailable, and much of the 1984 stratigraphy is rumored to have been mixed. The present analysis emphasizes an excavated area with multiple radiocarbon dates that fall between 877 +/- 26 (905–728 cal BP) and 9,143 +/- 38 RCYBP (10,408 and 10,299 cal BP). Through quantification (e.g., counts, ratios, weights) of nut remains in this deposit, and direct dating of multiple samples of this resource class for temporal control, we develop a gross measure of nut resource use over a 10,000-year period.

[64] *Los Morteros and Pampa de las Salinas: Early Monumentality and Environmental Change in Preceramic Peru*

Los Morteros is a preceramic archaeological site located on Pampa de las Salinas, in the lower Chao Valley, north coast of Peru. Archaeological excavations in 1976, Los Morteros was identified as a "stabilized dune" whose top was used as a cemetery for pre-pottery people around cal. 5000 BP. Excavations in 2012 and 2016 have uncovered a very long and complex history of occupation of Los Morteros which includes the presence of early adobe monumental architecture dating before 5500 cal. BP, more than 1000 years earlier than this type of architecture was previously recognized in the Chao Valley. On the other hand, Pampa de las Salinas is a preceramic archaeological complex composed by more than 20 archaeological sites and features including monumental sites, shell middens, geoglyphs, and trails, all of which combined into a preceramic ceremonial landscape. Our research has shown that the preceramic occupation of Los Morteros and Pampa de las Salinas was closely related to constant environmental transformations of the local environment.

[185] *Stable Isotope Analysis of the Diet of Romans and Langobards in the Veneto from Late Antiquity to the Medieval Period*

Limited isotopic research has been conducted in the Veneto, Italy during the transitional period after the fall of the Western Roman Empire and arrival of the Germanic Langobards in the sixth century AD. Questions remain of the local implications of diet during this period of instability, when invasions and population decline occurred. Thus, this research compares Roman and Langobard populations from late antiquity to the medieval period using stable isotope analysis on bone collagen, apatite, and tooth enamel for 78 human individuals and 10 faunal remains to investigate diet in the Veneto. The results indicate variations in diet within and between the populations. The late antiquity sites are more consistent with a C3 plant diet with some marine and terrestrial animal contributions, while the Langobard sites are varied. This study shows that in late antiquity people in the Veneto still relied on a traditional Roman diet of fish and C3 resources after the fall of the Western Roman Empire; however, the incoming Langobards show variation in their utilization of resources, with some consuming more of a C4 diet with millet. This preliminary research may indicate a change in resource allocation during the initial transition into Italy for the Langobards.

[265] *Adapting to Changing Resources: A Petrographic Analysis of Iron I Pottery from Tel Miqne-Ekron*

The arrival of foreigners to the southern Levant at the beginning of the Iron Age (1200–1000 BCE) has been recognized in the material culture, as have changes in this material culture over time. These developments, resulting from interaction with the local population, have been interpreted as

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

assimilation, acculturation, creolization, and most recently entanglement. In this poster, we examine these transformations through the lens of technological, i.e. those aspects of pottery manufacture that reflect shared technical choices and transmitted knowledge. At the site of Tel Miqne-Ekron, morphological analysis has defined two distinct but contemporary potting traditions: a non-local and an indigenous one. In this study, petrographic analysis of ceramic thin sections are used to first test these observations. Secondly, we examine changes over time in clay and temper use. As raw material use is tightly linked to almost all other aspects of the ceramic production process, e.g., drying time, firing, manufacturing style, vessel function, many observed stylistic changes in the non-local ceramics probably resulted from the need for foreign potters to adapt to local resources. Recognizing shifts in raw materials, and thus resource acquisition, should provide new insights into understanding the working relationships between these two co-habiting populations.

Mazzariello, Joseph, Michael Harrower (The Johns Hopkins University) and A. Catherine D'Andrea (Simon Fraser University)

[210] *Empire of Aksum Settlement Patterns: Site Size Hierarchy and Spatial Clustering Analyses*

Settlement pattern analysis has long remained a key means of examining the social, economic, and political relationships among archaeological sites and the way those relationships changed through time. Two common approaches involve: 1) analyzing the relative sizes of sites to evaluate possible site size hierarchies, and 2) analyzing the spatial distribution of sites across landscapes to evaluate possible clustering or dispersion. This paper applies more statistically rigorous methods than commonly employed, namely Ripley's K Multi-Distance Spatial Cluster Analysis to evaluate possible spatial clustering/dispersion, and Bayesian Information Criterion (BIC) analysis to evaluate possible site size categories/hierarchies. These methods are performed on archaeological site data from two distinct areas of the northern Ethiopian highlands collected by the Eastern Tigray Archaeological Project (ETAP) and Southern Red Sea Archaeological Histories (SRSAH) Project. Results show strikingly similar patterns in the two areas, including an increase in the number of sites and decrease in average site size over time, site clustering only during the Pre-Aksumite period, and a lack of site size hierarchies that are predicted by traditional models of state-level settlement patterns.

[159] *New Perspectives on the Native History and Archaeology of Block Island*

Supported by the U.S. National Park Service's Historic Preservation Fund program to identify coastal archaeological sites damaged by 2012's Hurricane Sandy in Rhode Island, archaeological surveys of Block Island were conducted in 2014 and 2015. The survey identified 163 archaeological sites of which 33 were tested and partially excavated. Previous archaeological surveys of Block Island concluded that a high frequency, density, and complexity of Woodland (2700—400 years before present (B.P.) and Contact Period (400—350 B.P.) archaeological sites located on landforms immediately adjacent to the interior salt ponds with far fewer, and much less complex sites located on the bluffs along the seaward coastline. Larger and more complex permanent and semi-permanent village sites were believed to be located almost exclusively along the salt ponds with smaller temporary and task specific sites associated with freshwater swamps and ponds throughout the interior and near coastal areas of the island. The identification of several large seaward Woodland and Contact Period coastal sites suggest a much more complex settlement pattern than previously believed. These sites are believed to represent spring fishing camps, indicating that earlier reconstructions of Native settlement patterns on Block Island need to be revised.

[138] *How to Update a Classic: The Renewal of Here, Now and Always at the Museum of Indian Arts and Culture*

Here, Now and Always (HNA) opened at the Museum of Indian Arts and Culture (MIAC) in Santa Fe, NM in 1997. This permanent exhibition is an introduction to the peoples of the US Southwest and was the first in the US to be curated by an expansive community. It was developed through the participation of more than thirty individuals and with seven core community curators. The community voices dominate the exhibit text and the community curators determined the exhibition message, object selection, and layout. HNA later served as the model for the initial exhibits at the National Museum of the American Indian.

Over the course of twenty years, however, HNA has not been updated, so that today it suffers from a static design, obsolete technology, and noncompliance with the Americans with Disabilities Act. MIAC has embarked on an ambitious plan to renew and update the exhibition while honoring the original curators and the inclusive process through which it was created. This paper addresses our plans to update the archaeology in the exhibition while respecting the intent of the original curators and the sensitivity of the topic.

McCabe, Chris (University of Rhode Island), Rod Mather (University of Rhode Island) and Timothy Ives (Rhode Island Historical Preservation and Heritage)

[159] *The Rhode Island Archaeological and Historical Geographic Information System (GIS) Development Project*

In 2017 the Rhode Island Historical Preservation and Heritage Commission teamed up with the University of Rhode Island's Applied History Laboratory to develop a Geographic Information System (GIS) incorporating the state's complex assortment of archaeological and historical sites. With support from the National Park Service, their objective is to collect and share the stories of Rhode Island by creating a fully operational and sustainable geospatial database of known archaeological sites and listings in the Rhode Island and National Registers of Historic Places. Along the way, multiple layers of diverse yet highly relevant supporting information are also continually being added to the system. These include geographic, jurisdictional, and environmental data from the Rhode Island Geographic Information System (RIGIS), orthographic and infrared imagery from the USGS, bathymetric and navigational information from NOAA, RIDEM wetlands data, USDA soils information, and a wide array of historical maps, nautical charts, and analytic digital imagery.

McCafferty, Geoffrey (University of Calgary)

[263] *The Pipil/Nicarao Migration from the Perspective of Pacific Nicaragua: An Archaeological Critique of Mythistorical Mobility*

Ethnohistorical sources describe migrations from central Mexico of Nahuatl and Mangue speakers, known as the Pipil/Nicarao and the Chorotega, who settled along the Pacific Coast of Central America in the centuries prior to European contact. According to these accounts the new groups introduced cultural and religious traits into settlements in El Salvador, the Pacific coast of Nicaragua, and northwestern Costa Rica. Beginning in 2000, archaeologists from the University of Calgary have investigated various sites along the shore of Lake Cocibolca, searching for evidence of migration

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

and colonization of the region. Based on these intensive excavations we have NOT identified evidence of the Pipil/Nicarao, and characteristics of the Chorotega are enigmatic at best. Although innovative features do appear beginning about AD 700, particularly in terms of polychrome ceramics and mortuary patterns, the evidence supports only limited Mexican contact but with more interaction with greater Central America. This paper will present excavated data to critique the historical sources, with the conclusion that the historical myths are not reliable chronicles for interpreting pre-Columbian migrations.

[263] *Praying to the Predator: Symbols of Insect Animism on Luna Polychrome*

Pacific Nicaragua has long been noted as a cultural crossroads, especially featuring historically documented migrants from central Mexico. Following ethnohistorical accounts, Nahuatl speaking groups colonized the Rivas area in the Late Postclassic Ometepe period. The most prominent diagnostic ceramic of this time was Luna Polychrome, often found in mortuary contexts. This paper presents a detailed analysis of over 50 Luna vessels from the Mi Museo collection. The overarching theme of the painted designs relates to the Praying Mantis. This interpretation coincides with oral traditions relating the mantis as the "Madre Culebra", a powerful and revered predator of the insect world and closely affiliated with female symbolic authority. The association of these vessels with mortuary ritual suggest links to the Nahuatl deity Cihuacoatl, a goddess of death and regeneration, whose name also translates as 'woman serpent'.

McCall, Grant (Tulane University) and Theodore Marks (University of Iowa)

[32] *Beer in the Desert: Archaeological, Ethnohistoric, and Experimental Perspectives on Early Beer Brewing in the Central Namib Desert, Namibia*

For the better part of a century, archaeologists have surmised that beer brewing played a significant role in a range of major social and economic changes having to do with origins of agriculture. This paper examines an unusual case of early beer brewing, which likely originated during the Middle Holocene among the Later Stone Age (LSA) populations of the hyper-arid Central Namib Desert of western Namibia. In this paper, I discuss practices of modern traditional beer brewing in the region and I offer archaeological evidence implying the relatively deep antiquity of these practices. I also present the results of an experimental program aimed at replicating these traditional beer brewing practices. Based on this combined evidence, I argue that beer brewing played a key role in helping LSA populations in the Central Namib Desert process complex and labor-intensive food resources and that it held particular advantages in coping with the extreme aridity of the region. Finally, I explore some of the social consequence of beer brewing in the Namib, past and present.

[270] *Cranial Modification and Presence of Wormian Bones in Chanka Crania*

The Chanka of ancient Peru (1000AD—1400AD) employed cranial modification. The most common reshaping methods involved including wrapping material around the head of an infant. This project investigates the correlation between cranial modification and wormian bones in Chanka crania. We sampled 26 adult crania and recorded qualitative and quantitative data on head shape. We also observed wormian bone presence, location, and size. Crania that exhibited significant sexual dimorphism (to be characterized as male or female) were correlated with head shape and wormian bone attributes. We used a similar approach to compare data between wormian bones in both modified and unmodified crania. There continues to be much debate regarding the etiology of wormian bones: either based solely on genetics, or a combination of environmental factors. Our initial results suggest that cranial modification is linked to (and a potential cause of) wormian bones, particularly in the lambdoid suture. These data also demonstrate a compelling link between cranial modification intensity (head elongation) and a higher frequency of wormian bones presence and ossicle size.

McCloskey, Galen (Northern Arizona University)

[184] *Analysis of Prehistoric Flagstaff Cultural Developments*

The chronology of prehistoric cultural developments within the American Southwest has been a subject of interest and debate since the archaeologists began to study the region. Although archaeologists have recognized patterns of aggregation throughout the Southwest, the degree to which the patterns are synchronous through prehistory remains uncertain. This research focuses on the development of a cultural chronology of the prehistoric Flagstaff area ranging from A.D. 600 through A.D. 1300, constructed using tree-ring data and mean ceramic dates. The chronology tracks the development of cultural phases based on aggregation and ceramic traditions. I compare resulting chronology to other chronologies to test a theory of simultaneous development in the Southwest region.

McClung de Tapia, Emily (IIA-UNAM MEXICO) and Guillermo Acosta-Ochoa (IIA-UNAM-MEXICO)

[262] *Early Subsistence and Settlement in the Basin of Mexico: Preceramic and Pre-urban Indicators*

The race to stay ahead of modern human impact on preceramic and early ceramic sites in the Basin of Mexico is particularly dramatic. Recent investigations at sites located in three sectors of the Basin of Mexico, all of which are threatened to some degree, contribute to a broader understanding of the kinds of communities that anticipated increased complexity in social, economic and political spheres that ultimately developed into early urban centers such as Cuicuilco and Teotihuacan. Excavations at San Gregorio Atlapulco, Tepexpan and Altica add new data to the ever-increasing picture of the range of adaptations to different environmental conditions and available resources in the Basin. While current data are still extremely fragmented, these new developments complement earlier studies such as those undertaken at Zohapilco (Niederberger), Terremote-Tlaltenco (Serra Puche) and Cuanalan (Manzanilla), thus filling in some of the gaps that will be increasingly more difficult to bridge as time passes.

[75] *Regional Defensive Strategies and Chronic Warfare in the Southern Nasca Region*

Warfare was a prevalent phenomenon throughout the Andes during the Late Intermediate Period (AD 1000–1450; henceforth LIP). A salient research topic within broader investigations of conflict is how populations cope with chronic warfare. This presentation utilizes geostatistical analyses of architectural and topographical features to reconstruct defensive coping mechanisms among LIP groups living in 12 fortified settlements in the southern Nasca highlands of Peru. Analytical results reveal a regional defensive pattern whereby the smallest most vulnerable groups invested the most in fortifications and occupied the least accessible hilltops. Variation in fortification investment within each site was driven by differences in the accessibility of approaches leading to a site's residential sector. This research demonstrates that LIP populations made optimal trade-offs between competing defensive variables, revealing highly patterned regional defensive strategies that vary from defensive practices observed in other LIP regions. This variation is likely the result of groups implementing defensive strategies to cope with local patterns of warfare.

McCormick, David (Yale University)

[154] *Cotzumalguapa's Lithic Industry: Procurement, Production, and Distribution of Obsidian Artifacts of a Late Classic Mesoamerican Polity*
Procurement, production, and distribution of raw materials loom large in discussions of prehistoric economies. Over the past three decades surface survey and excavations in and around the Late Classic polity of Cotzumalguapa revealed the presence of several obsidian dumps, the result of a large-scale lithic industry. These deposits contain production debitage from most phases of blade-core reduction but no nodules and relatively very little cortex, suggesting that obsidian came into Cotzumalguapa as prepared cores. Within the deposits cores occur in low frequencies and when found are generally nearly exhausted. The presence of both a primary prismatic blade-core and a secondary but significant bifacial and unifacial projectile point industry are indicated by both the debitage and the finished and near finished artifacts discarded in the obsidian dumps. As visual analysis suggests and geochemical analysis has confirmed the vast majority of the obsidian comes from the Guatemalan Highland sources of El Chayal and San Martín Jilotepeque; however, other sources are represented.

McCorrison, Joy (The Ohio State University), Mark Moritz (The Ohio State University), Ian Hamilton (The Ohio State University), Sarah Ivory (The Ohio State University) and Konstantin Pustovoytov (University of Hohenheim)

[283] *Pastoral Territoriality as a Dynamic Coupled Human-Natural System*

Despite research indicating that contemporary pastoral societies are more dynamic than previously assumed, there is a tendency to view South Arabian pastoralists as timeless heirs of a stable, ancient system or along a historical continuum of response to exogenous factors like the development of civilization, introduction of camels, or global climate change. In research triggered by NGS support, we propose a new conceptual model for pastoral mobility regulated by dynamic feedback loops in human-natural systems. Inspired by archaeological data showing pulses in monument construction and settlement—indicators of territorial behavior—we argue that pastoral ecosystems are non-linear and cycle between more open and more closed regimes while grazing land cycles between more and less productive states due to changes in population and cover. We report new research using archaeology, paleoecology and agent-based modelling that will integrate model simulations with empirical records for a better understanding of pastoral mobility over 7000 years in Southern Arabia.

[178] *Tracing Interaction Networks in a Mosaic of Politico-Geographical Regions at the Site of Wimba, Amazonas, Peru*

The ecological setting and the political formations located in the Ceja de Selva raise unique terminological and conceptual questions for the study of interaction networks. Specifically, how do we best recreate meaningful “archaeological regions” within a mosaic of ecological zones and groups with poorly known culture histories? Presenting results from the Proyecto Arqueológico Wimba—2016, this paper analyzes the chronological development of the Wimba site within the Ceja de Selva of eastern Amazonas, Peru. Based on stratigraphy, radiocarbon dates, material culture, and architecture, Wimba went through both periods of local development and periods of involvement in regional interaction networks in the Late Intermediate Period (1000–1450 CE). The site is located along strategic pathways between the highland Chacha and eastern lowlands, and it includes diverse structures and open spaces that hosted communal gatherings. Excavation results show a long-term occupation that includes at least three phases of architectural construction. Recovered materials indicate that intra-regional exchange networks were most prevalent until the final occupation, when the impact of highland groups was felt. This paper argues that communal gatherings functioned as centrifugal forces in interaction networks, and most importantly helped “emplace” a regional network that incorporated multiple nearby ecological regions.

McCuiston, Emily

[184] *Evaluating the Radiocarbon Record of the Lower Pecos Canyonlands*

The Lower Pecos Canyonlands archaeological region in southwest Texas and northern Mexico at the eastern limit of the Chihuahuan Desert is best known for the excellent organic preservation and polychrome pictographs found in dry limestone rockshelters. Radiocarbon dates from the Lower Pecos Canyonlands (LPC) can be used to address broad research questions pertaining to economic strategies (e.g., earth oven plant baking and bison hunting), and settlement patterns, as well as narrower topics such as the development of distinctive material culture (e.g., sandal types). The LPC radiocarbon data, consisting of over 500 assays, are derived from upland, terrace, and rockshelter sites excavated over the last 60 years, as well as curated objects spanning from the Paleoindian through Proto-historic periods. The majority of these data, over 300 assays, are from rockshelters. Preliminary analyses highlight the potential and limitations of the extant LPC radiocarbon data.

McCurdy, Leah (The University of Texas at Arlington)

[180] *Plaster Art: “Graffiti” in a Sage’s Chamber at El Castillo Acropolis of Xunantunich, Belize*

In 2016, we discovered a sage’s chamber in the El Castillo acropolis at the ancient Maya site of Xunantunich, Belize. In the Late Classic Tut Building on the east side of El Castillo, all interior and exterior plaster walls are incised with “graffiti.” The total number of elements documented is nearly 300 with themes ranging from human and animal forms to glyphs and multi-figure scenes. We expect to encounter more in future field seasons. Based on a variety of factors, we view this as practice art created by scribes/sages in training and for preparatory purposes. It appears that Maya scribes were using plaster walls as chalkboards to learn iconography, experiment with features, and sketch for various projects. The term “graffiti” does not adequately reflect these finds and their implications for understanding ancient Maya culture. These ‘plaster art’ finds share many qualities and conservation concerns with rock art. Further, our recording methods parallel many of the strategies employed in rock art studies across the world. With

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

this paper, our goal is to present our findings, discuss labels and methodologies, and open a dialogue with rock art specialists for the benefit of “graffiti” studies in the Maya region and Mesoamerica generally.

[327] *Reflections on Pragmatism and Academic Life*

Pragmatism is a challenging approach for a host of reasons—some emerge from the cultural behaviors and institutional structures of the academy, and others from the inequities that persist in modern society. It is also a profoundly satisfying one, when it “works”. This paper will reflect upon the opportunities and pitfalls encountered while “using” pragmatism over the past 20 years (practicing public and community archaeology, working with community groups and professional societies, editing a journal, and participating in other aspects of academic and professional life).

McDonald, Erin (University at Buffalo)

[98] *Peopling the Landscape: The Pollen Record and Nomadic Pastoralism in Iron Age Ireland*

The people of the Irish Iron Age are often referred to as ‘invisible’ due to their seeming absence from the archaeological record. Ceramics, so often associated with domestic activities, are not a part of the Iron Age material culture. Burials and domestic settlements dating to the Iron Age exist, but they are the exception to the generally sparse archaeological record. In the absence of sufficient material culture and settlement patterns, other means of studying the people of the Iron Age must be considered. Pollen, sampled from cores extracted from peat bogs, provide the means to reconstruct local vegetation and identify human impact and abandonment in the landscape. Examination of the pollen record from four bogs in the Midlands of Ireland show a pattern of low-intensity pastoralism, suggesting people lived in dispersed, likely nomadic, communities during much of the Iron Age. The Iron Age records indicate a starkly different way of life than that of the preceding Bronze Age and succeeding Early Medieval Period.

[126] *Dietary Insights from a Middle Holocene Latrine Feature at the Connley Caves (35LK50), Oregon*

The Connley Caves site is composed of eight rockshelters situated in a south-facing ridge of welded tuff on the margin of Paulina Marsh in the Fort Rock Basin of central Oregon. Poor preservation of perishable materials and the removal of much of the Middle Holocene deposits at the site with a backhoe during archaeological excavations carried out in the 1960s limit our knowledge of this period at the Connley Caves. Recent excavations conducted by the University of Oregon uncovered a small alcove between Caves 4 and 5 containing undisturbed Middle Holocene deposits, including a dense concentration of well-preserved coprolites interpreted as a latrine feature. Twelve of these coprolites have been analyzed for microscopic and macroscopic remains to investigate prehistoric diet and environment at the site. A wide variety of plants and animals were represented in the coprolite contents, suggesting a broad-spectrum diet that included seeds, fish, birds, and mammals. Results of the coprolite analysis are presented here, in conjunction with new radiocarbon dates and cultural materials from this feature.

[306] *A Comparative Bioarchaeology of Health and Status in Pre-Classical K’axob and Cuello*

This paper explores whether there is a statistical difference in rates of non-specific infection between two Maya pre-classic villages, K’axob and Cuello, and whether these findings can be correlated to social status within and between the two villages. Using representative skeletal samples from these populations, an osteological analysis is performed to determine the presence of non-specific infection markers in the form of periosteal reactions. Any signs of reaction are scored by level of severity and stage of healing, and results from the samples are compared. Combining these health indicators with other socioeconomic factors can be informative about the social status of individuals and allow both a correlation of infection rates among suspected elite versus non-elite individuals, as well as make a socioeconomic versus health status comparison between two villages within the region coexisting within the same period. Results may aid future inquiry into non-specific infection rates among the pre-classic Maya of the lowlands, and provide an overall picture of health within a framework of social conditions during this pivotal time-period in Maya development. Furthermore, if infection rates are similar between K’axob and Cuello, this information could be used to make inferences about other similar Maya groups during the pre-classic.

[172] *Online Data Curation: CAVEBase, ArchaeoSTOR, University Libraries and Long-Term Digital Archiving*

Although new technologies have made it possible to document historical and archaeological sites in greater detail than ever before, and have made it faster and easier to disseminate information, they have also brought about new challenges, especially in connection to long term data preservation. As the quantity of information stored digitally continues to grow it becomes increasingly important to actively curate the information now, for present and future reuse. Not only does data need to be protected against catastrophic and attritional loss, such as from hardware failure and personnel turnover, it also needs to be well-documented and discoverable in the correct contexts to be useful.

This paper provides a brief look at three ongoing projects at UC San Diego which address these challenges: CAVEBase, ArchaeoSTOR, and the UCSD Library Digital Collections. These projects explore new methods of entering, cataloging, interfacing with, preserving, and disseminating digital archaeological data such as 3D models, point clouds, high resolution photographs, videos, reports, and associated descriptions and metadata.

[222] *Saving Oberlin: African-American Historic Archaeology and Preservation in Raleigh, North Carolina*

Free African-Americans established Oberlin Village outside Raleigh, North Carolina in 1866 at the end of the Civil War. Within two generations, the people of Oberlin had constructed churches, a school, a cemetery, shops, and many homes. Today, Oberlin continues to be an important site for African-American history and identity. For example, Oberlin Cemetery (established 1873) is one of only four African-American cemeteries in Raleigh.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

The cemetery's more than 600 graves include many leading African-American figures in Raleigh's history, and several unique features such as a rare wooden marker and graves covered in sea shells and some likely decorated with glass bottles. However, the village and its historic and archaeological resources are threatened by development and gentrification. This poster highlights collaborative efforts between a local non-profit group, the Friends of Oberlin Village, and university scholars and students in the region, to document and save Oberlin through such efforts as cemetery surveys, grave-marker research, comparative studies of freedman villages, and public education.

[14] *Geophysical Applications at the Site of Fort Halifax, PA (36DA0008)*

Fort Halifax was constructed in Dauphin County, PA, by the British during the French and Indian War as part of a line of fortifications along the Susquehanna River. It was only garrisoned for about a year, from 1756–57, before being abandoned and dismantled by the end of the war. Due to its brief existence, the precise location of the fort has been lost, although the name of the modern town of Halifax perpetuates its connection to the area. Additionally, past historical research regarding Pennsylvania's colonial forts has preserved some crucial information about the site and its location. Several attempts have been made in recent years to locate the fort and study archaeological remains within the bounds of Fort Halifax Township Park, yet, to date, evidence of its walls or associated buildings has not been uncovered. This research builds upon earlier work by searching for evidence of the fort in a new location within the park. Geophysical surveying techniques are being applied to detect the presence of potential archaeological features indicative of the eighteenth-century fort. Ultimately, this project seeks to strengthen the bond between the people of Halifax and their town's history by improving their understanding of the township's colonial period.

[166] *Setting Things Right: Indigenous Archaeology in Sonora, México*

Larry Zimmerman taught us how to do Indigenous archaeology. He told us do not rob graves or lick bones, to ask questions that Indigenous people need answered, to put aside academic capital, to collaborate, to be radical, to listen, to be humble and to atone for the transgressions of our discipline. Such a transgression occurred in the Sierra Mazatan of Sonora, México. In 1902, a party of Yaqui warriors freed hundreds of enslaved Yaquis from haciendas near Hermosillo, and they sought refuge in the Sierra Mazatan. Days later Mexican troops outflanked the Yaqui warriors and attacked the camp of women and children killing 124 Yaqui. Three weeks later Ales Hrdlicka collected the skulls of 10 individuals, human bone, hats, blankets, weapons, and a cradle board from the battlefield. He shipped these materials to the American Museum of Natural History in New York City. The bi-national Proyecto Cerro Mazatan project worked collaboratively with the Yaqui tribes of Sonora and Arizona to repatriate the human remains and other materials that Hrdlicka took from the battlefield. The collaboration was a success and in the fall of 2009 the National Museum of American History returned the remains to the Yaqui People.

[328] *Current Middle Atlantic Paleoethnobotany*

A growing body of research from across the Middle Atlantic reveals patterns of native plant use that are both highly variable and unique within the North American landscape. This paper provides an overview of the current state of paleoethnobotanical research across the region, with a focus on the Chesapeake Bay where maize (corn) was a relative latecomer to the native subsistence regime. Multiple lines of evidence (including macro and micro-botanical data, direct radiocarbon assays and stable isotope research) illuminate the track and timing of maize adoption, and inform our understanding of the cultural processes that influenced this transition. The dearth of evidence of a farming antecedent (the Eastern Agricultural Complex) and evidence for a firm reliance on complex systems of natural resource management are central to the discussion.

[231] *The Maryland Archaeological Synthesis Project: One State's Solution to Archaeology's Crushing Gray Literature Problem*

Since passage of the National Historic Preservation Act fifty-two years ago a growing body of valuable data has been generated by state agencies, CRM professionals, and preservation officers. Unfortunately, this data is usually trapped in an archaic paper-based format, restricted geographically to a single state archive. All too often the data is brought to light only to be "reburied" in the SHPO's library where it may be largely inaccessible to researchers scattered throughout the country. This paper describes how the Maryland Historical Trust is addressing this problem through the establishment of a secure, online, searchable catalog of raw data and CRM reports.

[297] *"Every Plant is Medicine:" Overlapping Categories in Food Production and Ritual*

Wild plant collection is often a key component of food production. Yet, despite its dietary import, collection practices remain under-researched and "wild" plants are typically relegated to the margins of our archaeological analyses. Drawing on historical medicinal records, I discuss the practices surrounding the collection of medicinal plants and these plants' intricate entanglements in food production systems. In this presentation, I use the early 20th century ethnobotanical works of Huron Smith to explore possibilities for collection area, plant use, time of collection, and enacted rituals to expand current understandings of foraging practices. Using these records, I reconstruct foraging areas and determine the extent of landscape brought into production. I also discuss how medicinal plants in this region challenge our categories of wild, medicinal, and food, as plants can intersect multiple categories and aid their users in other forms of food production, like hunting. This presentation encourages us to rethink our archaeological categories and questions about modes of food production, including the spatial expanse of production systems, labor organization, and ritual.

[172] *The Digital Archaeological Record (tDAR): An Archive for 21st Century Digital Archaeology Curation*

Archaeological research both produces and uses substantial amounts of data in digital formats. Researchers undertaking comparative studies need to be able to find existing data easily, efficiently, and in formats that they will be able to access and utilize. Researchers creating or recording data need a repository where they can place the data they generate so that it will be discoverable, accessible, and preserved for long-term use. The Digital Archaeological Record (tDAR) is a broadly accessible domain repository for archaeological and archaeologically-related data and information. tDAR is especially helpful and useful for Cultural Resource Management (CRM) firms, public agencies, individual scholars, and research organizations that are not affiliated with, and therefore unable to access and use, institutional digital repositories, such as are maintained by some major research universities. Researchers with access to institutional repositories still may prefer to use tDAR since it is tailored to archaeological and other cultural heritage data and information. Current users of tDAR include academic researchers, public agencies, CRM firms, and others organizations responsible for archaeological data and resources.

[298] *Experimental Archaeology as a Tool for Understanding Microbotanical Taphonomy*

Microbotanical residue analysis, particularly starch grain and phytolith analysis, of ground stone artifacts has become a well-established method for investigating subsistence practices, plant processing patterns, and tool use at prehistoric sites around the world. Within the Aegean, however, where wheat and barley are the primary staple grains, microbotanical analysis of stone tools has only recently been incorporated into on-going research. A collaboration between PlantCult, a European Research Council funded project of the University of Thessaloniki, and the Wiener Laboratory (ASCSA) is advancing work on this important topic through experimental research. As part of PlantCult's multidisciplinary study of food culture, grinding experiments have been conducted utilizing different tool types and a variety of Aegean staple resources. This paper presents the microbotanical component of this research, which addresses four questions: 1) the impact of grinding time, material type, and tool type on phytolith and starch morphology, 2) the effect of sampling methodology, specifically dry brushing, wet brushing, and sonicating, on recovery, 3) the assemblage of microbotanicals on re-utilized tools, and 4) the potential for recovery from archaeological materials. Although directed toward Aegean research, this study highlights the usefulness of experimental studies and provides comparative data relevant to research in other regions.

[76] *Capturing the Fragrance of Ancient Copan Rituals: Floral Remains from Maya Tombs and Temples*

Pollen analysis of Classic-period temple and tomb spaces in Copan's Acropolis revealed a range of plants important to ancient Maya ritual practice. Some of these species were not represented in macroremains in ritual or household contexts. Scholars have described temple spaces as thick with the odor of burned offerings and copal, but added to this would also have been the fresh and heady fragrance of blooming buds and greenery, adding a fecund perfume to the areas of ritual supplication. These botanical adornments and offerings were undoubtedly tied to mythical associations, as they are in some modern Maya ritual houses. Analysis of pollen from sediment cores, and macroremains from middens, aided in the interpretation of ritual botanical materials, emphasizing the importance of understanding the complete ecological context of a community in the interpretation of species commonly found in ritual spaces. Few archaeological projects in the Maya area take floor samples for pollen analysis from buried temples and tombs. As this paper will demonstrate, this is a tremendous loss regarding our understanding of ancient Maya ritual practice, nearly as great a loss as the failure to take residue samples from vessels.

[86] *Pre-Columbian Introduction of Legume Trees Prosopis Algarobia Section and Geoffroea decorticans into the Atacama Desert of Northern Chile during the Late Holocene*

Our recent research in the Atacama Desert (18–27°S) proposed that *Prosopis* trees, *Algarobia* section (*Algarrobo*) were introduced during the late Holocene by humans and dispersed through cultural and natural factors. At least 41 direct AMS on seeds and pods retrieved from archaeobotanical and paleoecological contexts (rodent middens and leaf litter deposits) show that the earliest presence occurred ~4200 cal BP but most dates fall over a thousand years later, during and after the Formative period. This hypothesis is further supported by the available biogeographic and phylogenetic data for this genus in the Americas. Another cultural valued tree *Geoffroea decorticans* (Fabaceae-Mimosoideae), may have also been introduced into the Atacama. Here we present a review of the taxonomy and biogeography of this genus, as well the preliminary results of AMS dating on paleoecological and archaeobotanical remains associated to Archaic occupations, giving a mean age of ~500 cal BP. Ongoing studies aim to generate a large dataset of AMS dates and phylogenetical analyses across the region to gain a better understanding of the status of these trees. Moreover, a comprehensive approach of their cultural management is mandatory to assess the pre-Columbian and ecological history of this arid landscape.

[43] *Fish Butchering and Processing in Archaeology: Proposed Methods for Academic and CRM Analyses*

Globally, fish are recovered from archaeological contexts, but often a thorough analysis for how fish were processed is often overlooked due to time constraints or a lack of attention paid when examining a faunal assemblage. While the butchering of medium to large mammals is often undertaken as part of a zooarchaeological analysis, fish bones are often ignored or cut marks missed. This can be due to a variety of factors, including limited time and varying levels of expertise. This project addresses a series of variables for setting up a good basis for time sensitive and/or large projects to incorporate accurate fish processing data within an analysis. Experimental work, various levels of student skills, timelines, and laboratory space set-up were used to create a series of potential parameters that can be replicated in lab, classroom, and garage settings, to increase the likelihood of successful data collection. Two Late Prehistoric sites from the Great Lakes region are used to track the success rates in different settings for novice and experienced student researchers' abilities to learn and distinguish cut marks on fish bone.

[53] *Here Not Be Dragons from the End Times: Exploring Virginia Archaeology Using the 3D Printed Past*

What to do when a museum visitor asks you if your dinosaurs are dragons from the end times? At their invitation, the Virtual Curation Laboratory at Virginia Commonwealth University (VCU) teamed with the Virginia Museum of Natural History (VMNH) to create an exhibit entitled Exploring Virginia to use archaeology as a way of encouraging critical thinking. This exhibit drew on over 120 3D printed artifacts from archaeological sites across Virginia and the globe. VCU students in the inaugural Visualizing and Exhibiting Anthropology course taught by the senior author selected the objects to be 3D printed. These students also helped design text to teach museum visitors about the length and diversity of human habitation of Virginia and the Commonwealth's natural setting. How archaeologists approach the past, and how they address complicated issues, such as Virginia's sordid history of enslavement, were themes integrated into the exhibit. During the exhibit's run from September 2015 to June 2017, 93,389 individuals visited the exhibit and learned how archaeologists contribute to our understanding of humanity's place in a changing world. In addition, nearly 27,000 people viewed 360 degree photos of the exhibit on Google Street View, enabling the exhibit to reach a broader audience.

Meier, Jacqueline (Trent University)

[217] *Faunal Perspectives on Occupation Intensity and Use of Space at Neolithic Kfar HaHoresh*

During the transition to agriculture in southwest Asia, patterns of settlement site use reflect a major shift in the use of space by the Pre-Pottery Neolithic period. Diverse types of sites were utilized by this time, including locales primarily for ritual activities. More studies of ritual site use are needed to clarify how space was organized and used during the Neolithic Transition. This paper presents evidence of animal selection and refuse management to investigate the intensity of site occupation and use of space at Kfar HaHoresh (10,600–8,700 cal. BP), the only Pre-Pottery Neolithic site in the southern Levant that served a primarily mortuary function. I employ zooarchaeological methods to assess the intensity of site occupation based on the degree of hunting pressure that humans placed on small game from the environment immediately surrounding the site. Taphonomic analysis of faunal refuse deposition is used to further illuminate the use of space, namely cleaning practices. These combined results reveal continuity in the organization of ritual space over time, despite a shift in occupation intensity, and clarify the interrelationship of ritual and habitation site use as farming life-ways developed.

[127] *A Geoarchaeological Approach to Site Formation and Structures of Inter-zonal Paleoindian Sites in Southern Peru*

A key question in the settlement of the Americas is how early forager groups adapted to different ecological settings while maintaining social connections. Quebrada Jaguay (QJ-280) on the Pacific Coast and Cuncacha Rockshelter in the Andean highlands of southern Peru, exhibit very different subsistence adaptations, yet these sites were linked within a common settlement system in the Terminal Pleistocene and Early Holocene. Here, we present the results of multidisciplinary geoarchaeological investigations at both sites. During the excavations various structures and features, as well as complex site formation processes were encountered, raising questions about, amongst others, behavioral factors in the sites' formation. This was addressed by combining micromorphology with pedological and FTIR analyses. These techniques provided insights, invisible to the naked eye, about the sedimentary components, and depositional and post-depositional processes of both sites at a microscale that we could link to the overall site structures. The geoarchaeological approach to the site allowed us get a better understanding of single features and structures in the sites, as well as to investigate the influence of natural and human factors in a site's formation.

[101] *Repurposing Scale in Three Mesoamerican Centers: Landscape Archaeology and High-Resolution 3D Modeling at Teotihuacan, Altar de Sacrificios, and Los Mogotes*

With the rise of structure from motion (SfM), affordable unmanned aerial vehicles, and other advances in remote sensing, landscape archaeology is at a watershed moment. These new tools allow for the mapping and digital reconstruction of large swaths of land rapidly enough to be reviewed in the field at a spatial, spectral, and temporal resolution that rivals any previous technology. Away from the field, these reconstructions are invaluable datasets that can be used to analyze the landscape at scales ranging from a few square centimeters to over a dozen square kilometers. This conceptual normalization of broad scales of the landscape to a size that we can comfortably interact with has wide implications when it comes to initial project design, on-the-ground decision-making, data analysis, and broader outreach. In this presentation, these possibilities are interactively explored with color, high-resolution (between three to five centimeters) digital landscape reconstructions of Teotihuacan and Los Mogotes in Central Mexico and Altar de Sacrificios in the Petén Lowlands, along with Parrot Sequoia high-resolution (between seven to ten centimeters) multispectral imagery for the two highland cases.

Melgar, Emiliano (Museo del Templo Mayor-INAH) and Reyna Solís (Museo del Templo Mayor)

[209] *The Mayan Style Lapidary Objects in Mesoamerica outside the Maya Region: Provenance, Manufacture, Distribution, and Symbolism*

Across Mesoamerica and outside the Maya Region, archaeologists have found different greenstone lapidary objects with glossy appearance and particular iconography and aesthetics that were considered as jadeite and crafted by the Maya. Unfortunately, their detailed analysis to confirm these assumptions is scarce. In this paper, we will show the study of Mayan style lapidary items from different sites, like Teotihuacan, Monte Albán, Teteles, Tula, Tamtoc, and Tenochtitlan. We employed Micro-Raman Spectroscopy, X-Ray Fluorescence, X-Ray Diffraction, and Energy Dispersive Spectroscopy, to determine their chemical composition and mineralogical characteristics. These techniques allowed us to identify two raw materials, jadeite and green quartz from the Motagua Valley in Guatemala. Also, with technological analysis of their manufacturing traces, Experimental Archaeology and Scanning Electron Microscopy, these objects showed two patterns of manufacture that share the tools and techniques detected on Mayan jewelry, especially on jadeite pieces. Based on these results, we could infer the symbolism of these exotic greenstones in the burials and offerings outside the Maya Region as long-distance prestige goods for the elite members and powerful sacred items for the priests.

[304] *What's Shape Got to Do With It? Evaluating the Degree to Which Motion and Material Type Influence Edge Outline of Obsidian Flakes*

Often in the study of stone tools, without the application of microarchaeological studies and the presence of microwear, little is left to distinguish how the tool was used originally and what the tool may have been processing. Was it used for scraping? Sawing? Slicing? Was it slicing bone? Scraping animal hide? Is it even possible for archaeologists to discern such behaviors from the tool without having access to definitive microwear traces and/or residues? In this study, we test whether the shape of a flake's edge may yield information regarding its utilization. More specifically we look at whether certain performed motions and usage on varying material types result in similar effects on the overall outline of the flake edge over time. An experimentally produced obsidian flake assemblage is utilized, with the targeted flake edge outlines mathematically defined using Elliptical Fourier Analysis (EFA) and statistically evaluated in R before, during, and after use. Effects of variation in the pre-use edge outlines on the discrimination after

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

use between behavioral categories are evaluated. From the results, we establish expectations for the ability of EFA to statistically distinguish edge shapes according to motions performed in use and/or the material type being processed.

Melton, Mallory (University of California Santa Barbara)

[76] *Towards a Social Paleoethnobotany of Urbanization: Integrating Macrobotanical and Microbotanical Data to Explore Foodways at La Blanca, Guatemala*

This paper uses macrobotanical and microbotanical remains to investigate the impacts of developing sociopolitical complexity on the foodways of Middle Preclassic inhabitants of the Pacific coast of Guatemala. I use these datasets to explore how urbanization affected food-related practices of residents of La Blanca (900–600 BCE). Macrobotanical remains from house floors facilitate comparisons between elite and commoner foodways, while starch grains and phytoliths extracted from grinding equipment, domestic cooking wares, and large vessels used for communal meals directly identify foods prepared for various occasions. This study critically contributes to our understanding of how early urbanization impacted the daily lives of ancient inhabitants of the Southern Maya Region.

[182] *The Geoarchaeological Contributions of Vance T. Holliday*

Vance T. Holliday has played a key role in developing our understanding of the late Pleistocene geological history, climate and environment of North America, especially the Great Plains, and of the context and chronology of Paleoindian sites. The localities he has worked on, and to which much is owed to his interpretation of their geoarchaeological setting and histories, include iconic localities such as the Clovis, Folsom, Midland and Plainview type sites, and especially the Lubbock Lake site, where his decades of research and fine-grained studies have made it a model of a geoarchaeological study. At these sites and others where he's worked, his research is routinely marked by efforts to understand the broader processes of landscape evolution, and how such changes impact our ability to find and understand archaeological sites.

[100] *The Inka Empire in the Valley of Volcanoes, Southern Peruvian Andes*

States and empires attempt to incorporate and transform local landscapes and cultural practices in efforts to legitimize their social orders. Research on the Inka Empire in the Andagua Valley of the Southern Peruvian Andes has shown how these processes are incomplete and become entangled with local practices and the stubborn materiality of history. This poster presents recent archaeological and anthropological research, identifying the reach and effects of Inka Empire and distinguishing local pre-Inka and non-Inka cultural occupations and practices. This research reveals the tensions of empires evident in local settlement patterns, cultural practices and material culture, such as, stone offerings and monoliths (huancas), and ceramics that were marginalized and expanded during Inka rule. The painted stone disc and tablet tradition, in addition to larger stone features, articulated and manifest relations of history, power and space among local inhabitants in the valley. In Andagua, Inka imperial statecraft sought to re-orient local populations' relations with the landscape, shifting from local huacas and ritual locations in the southern edge of the contemporary town of Andagua to emphasizing the volcanic flows of Ninamama and the broader valley through the placement of an ushnu (ceremonial platform).

[187] *Persistence in Turkey Husbandry Practices in the Southwest and Four Corners Region: The Isotopic and Ethnohistorical Evidence*

Research has demonstrated an independent domestication event of Turkey (*Meleagris gallopavo*) occurred in the Southwestern USA between 200 BC—AD 500, which was separate from the domestication of turkey within the Mesoamerican world. While aDNA analyses revealed this as a separate and distinct event, we still know little about how turkey husbandry was practiced in the prehistoric Southwest, USA, Northwest, Mexico, and Four Corners regions. Our research applies carbon and nitrogen isotopes to a sample of archaeological turkey bones from Tohatchi Flats, New Mexico, USA. We contextualize these data, by comparing the data to wild modern turkey and additional data from other sites in the region. Results indicate some maize foddering and/or scavenging suggesting penning was not the dominant management strategy, while time periods during and after the medieval climatic anomaly (MCA) show a shift to confinement and maize foddering as the dominant strategy. The intensification of husbandry practices is an expected outcome of resource stress associated with the MCA, and this is also the time period when turkey pens begin to appear in the regional archaeological record. Isotopic expectations derived from ethnohistorical accounts suggest general continuity in both passive and intensive management strategies when compared to the prehistoric data.

Mendelsohn, Rebecca (Smithsonian Tropical Research Institute)

[153] *Ritual and Domestic Plant Use on the Southern Pacific Coast of Mexico: A Starch Grain Study of the Formative to Classic Period Transition at Izapa*

In southern Mesoamerica, the transition from the Formative period to Classic period (100 B.C.- A.D. 400) was a time of population decline, cessation of monumental construction, and the abandonment of many sites. Environmental explanations such as drought and volcanic activity have been proposed as potential trigger factors for the widespread collapse at the close of the Formative period. Current evidence suggests that residents of the early capital of Izapa, located on a piedmont environmental zone of the southern Pacific coast, fared better than neighbors in other early cities during this transition. From their piedmont location, residents of Izapa would have had access to plant resources from a wide variety of environmental zones, including the coastal plain, estuaries, mangrove swamps, and the beach. This study applies starch grain analysis, a microbotanical technique, to ceramics and ground stone pieces recovered from domestic ritual and refuse deposits at the Formative period capital of Izapa. Documentation of the diversity of plant foods used by Izapa's population is intended to better understand the resilience of this coastal population during a period of potential environmental stress, when maize agriculture may have been a less reliable source of food.

[74] *High Resolution Chronology of the Human Occupation South of Choapa Basin (31°34' -32° S), Chile*

The area south of Choapa basin in Chile has long been subjected to archaeological research through scientific as well as cultural research management projects. Surveys, excavations, and sampling over these roughly 5000 km² area has yielded over 370 radiocarbon dates plus over 120 thermoluminescence dates (almost 0,1 dates/km²). Dates range from 30000 cal BP to modern, but the human occupation is constrained in the last 13,000 years. Such chronometric resolution allows discussing the intensity of occupation of the different environments and landscapes over time. Also, it provides means to compare the human chronological signature with the available local paleoclimatic data to discuss if aridity, and therefore shortages in resources, exerted pressure over the human groups inhabiting this area. The distribution of dates is not constant, but rather fluctuating and even showing certain periods devoid of chronological signature. It also exhibits a significant increase in the last millennia coupled with a higher intensity of occupations as suggested by the abundance of late age archaeological sites. The high resolution of the chronology of the southern Choapa basin contrasts with that of neighbor areas that may have alternative time distributions as suggested by preliminary data gathered over the last years. FONDECYT #1170408, #1140837.

[80] *Late-Terminal Classic Community Mobility and Migration at El Perú-Waka'*

Recent archaeology at the Classic Maya city of El Perú-Waka' has revealed a number of distinct communities making up the urban occupation. These communities possess their own cycles of settlement, florescence, and abandonment. Taken together, these cycles seem to show two distinct aspects that directly pertain to Classic Maya urbanism. One, it shows the urban landscape to be in a continuously changing state. The urban ruins encountered by researchers are the end product of centuries of such shifting settlement and rarely reflect contemporaneous occupation. Two, urban and hinterland communities across the city likely display a variable degree of mobility through time. The El Peru communities described in this paper appear to originate elsewhere and, after abandonment, migrate again. The shifting settlement reflects not just change over time, but mobility, a fundamental dynamic in urban settlement patterns. This paper investigates these phenomenon as evident from the archaeological record of El Perú-Waka', Guatemala. Communities occupy a position on the landscape, sometimes marginal positions, sometimes privileged ones, and seem to insert themselves into a preexisting urban system.

Mensah Abrampah, David

[67] *Slavery without Slaves: Archaeology of Frederikssted Plantation and Its Implications for Plantation Archaeology in Ghana*

In 1803, Denmark and Norway abolished the trans-Atlantic slave trade, which took effect on 1st January 1803. However, this did not end slavery itself in Africa. Intensification of cash-crop agriculture on the West African coast by the Danish colonists provoked an upsurge in the local slave trade. As the Danish plantation economy solidified, increasing numbers of enslaved people were engaged to labour in these plantations in Ghana. The research examines the documentary and the archaeological data of one of the earliest Danish plantations (Frederikssted plantation) established in 1794 in Dodowa, in Ghana. Frederikssted and other Danish plantations are part of the building blocks of long-term cultural contact spanning almost two centuries (1658–1850) between Denmark and Ghana, and they offer this research the opportunity to gauge the continuities and discontinuities in contemporary. The excavations and the resultant material culture reveal that Frederikssted plantation site represents different episodes of occupation, abandonment, and reoccupation. Indigenous local elites who reoccupied the plantation (after its collapse in 1802) have play a crucial role in shaping the plantation landscape, which provides a new way to understand plantation archaeology in general.

[301] *Weeden Island Shell Rings from the Bottom-Up: The View from Old Creek*

The transition to Weeden Island mortuary and ceramic expressions along the Florida Gulf Coast also coincided with a shift in settlement. During this interval, around A.D. 600–750, earlier Swift Creek shell rings were abandoned and Weeden Island rings established nearby. In many cases, these Weeden Island shell rings were substantially larger than their predecessors, however, some anomalously small, isolated Weeden Island rings have also been recorded, such as the Old Creek Shell Ring (8Wa90) in the St. Marks Wildlife Refuge. Presented here are preliminary results from recent fieldwork at Old Creek, including analysis of ceramics and radiocarbon dates, intended to place this site within the larger sequence of cultural and settlement change on the Gulf Coast during the late Middle and Late Woodland periods.

[248] *Photogrammetric Registration of Excavation and Sacbe Segments at Yaxuna*

Using aerial imagery in archaeological sites has been viewed as a powerful tool for site recordation. At the Maya site of Yaxuna, located 20km south of the ancient ruins of Chichen Itza and on the longest recorded Maya sacbe, we provide a case study of aerial survey work, combining altitude varying imagery from fixed wing and multirotor aircrafts. Combining such multi-scale imagery allows us to relate excavation scale to landscape wide architecture and layout. Features such as terrain, monumental and residential architecture, can be made more visible in a broader context through derivative products from photogrammetry, including but not limited to digital elevation models, watersheds, hillshades and vegetation color. At the site of Yaxuna, we use orthomosaic and photogrammetric registration to contextualize residential buildings with the sacbe which links to the sites of Ekal and Coba. The notable importance of the sacbe was highlighted by past exchange of people, goods and ideas between these communities, and is now pronounced by physical features in construction architecture and physical layout. Results are used to illustrate the major advantage of using aerial imaging for rapid extraction of site-wide architectural layouts.

[224] *The Rise and Fall of the Forest Canopy: An Application of Compound-Specific Stable Isotopic Analysis to a Holocene Sequence of Soils as a Record of Human Impacts in Southern Belize*

Derived from lipid-rich plant tissues (primarily leaf waxes), long chain n-alkanes are a durable organic biomarker whose relative abundance is used in paeoecological studies as a proxy marker of plant species composition, and as an indicator of biomass burning. Isotopic composition of individual n-alkane components preserves signals that reflect both hydroclimate and canopy height. These properties can be employed to examine spatially

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

integrated signals of anthropogenic land clearance in lake cores and buried soils. Presented here, are preliminary results of analysis of leaf-waxes recovered from soil profiles collected by the Uxbenká Archaeological Project near the site of Tzib'te Yux Rockshelter in southern Belize. Our research indicates these profiles include a Holocene-length sequence of deposition including the transition to agriculture, as reflected in a rapid shift in $\delta^{13}C$ of bulk soil organic matter, as well as the subsequent return of broadleaf forest following the Classic Period Maya occupation. Combined with geomorphic indicators of erosion, and a high precision climate record derived from a local speleothem, the profile presents an ideal test case for the application of plant-wax data in the SE tropics of Mesoamerica.

[16] *Building a Database to Understand the Architecture of Arctic Wooden House Remains*

Western Arctic archaeological sites hold the remains of wooden houses occupied during the second millennium AD by ancestors of the present Inuit people. Although the permafrost helps to maintain these features in excellent condition, the giant puzzle resulting from the collapse of the frame makes it hard to understand their original architecture. During the ArcticCHAR project, we excavated a house at Kuukpak (Northwest Territories, Canada) in 2014 and 2016. Facing the complexity of this feature, we created a new strategy to help us interpret this tangle of wooden remains. Combining both computer techniques (i.e. G.I.S, photogrammetry) with traditional field recording methods required a robust database to connect all of these data. In this paper, we explain the design of the database and the technical choices we faced during its creation and implementation, with one of our main goals being to use open-source software. Without a doubt, this methodology will help us to understand the building techniques of these impressive Western Arctic houses. Additionally, the use of open-source products will ensure the reproducibility of our method.

Merrick, Megan (Florida State University) and Tanya Peres (Florida State University)

[102] *Zooarchaeology of Domestic Activities at a Weeden Island Shell Ring in the St. Marks National Wildlife Refuge*

The purpose of this research is to examine different domestic activities at the Mound Field site (8Wa8), a Weeden Island shell ring in Wakulla County, Florida. Zooarchaeological analysis was conducted on the faunal remains recovered in 2016 from six excavation units at Mound Field. These units represent different hypothesized areas of domestic activities from across the site. The differential deposition of food remains may reveal more about the patterns of activities in which people participated, and can help to develop a more complete reconstruction of both the site and the environment.

[99] *Bone Preservation, Specimen Identifiability, and Outcrop Shape—A Preliminary Investigation of Early Pleistocene Taphonomy at Koobi Fora, Kenya*

Fossil bone surface assemblages include differential specimen preservation (weathering stage, cortical surface exfoliation, polish, roundedness, fracture type) and identifiability (taxonomic or anatomical precision). Three 1x1 meter inventory squares placed on steep, moderate, and minimally sloping areas of a fossiliferous outcrop test whether outcrop shape is a megabiases that influences assemblage attributes. A digital elevation model created from drone-captured aerial imagery describes outcrop slope, erosional potential, and pooling potential for each inventory square. In general, erosional potential increases with outcrop slope and pooling potential increases in flatter areas, but these attributes do not covary perfectly in our squares. We analyzed all (between 21 and 40) specimens per square, and observed that median specimen size, the distribution of specimen weathering stage, fracture type, roundedness, and precise anatomical identifiability were not related to outcrop slope. The flattest square was overrepresented in abraded and taxonomically identifiable specimens (superfamily or finer). The steepest square was overrepresented in exfoliated specimens. The moderately sloping square was underrepresented in exfoliated, abraded, and precisely identified taxonomic specimens. These results suggest that outcrop shape is not a megabiases that uniformly impacts assemblage formation, and that the complex relationship underlying fossil preservation, specimen identifiability, and outcrop shape warrants further attention.

[292] *Investigating Climatic Dimensions of the Archaeological Past with Undergraduates Using CADGAP (Climatic Analogs Data Gathering Project)*

Bryson and Murray's (1979) *Climates of Hunger* ignited my interest in climate change and human cultural discontinuities over time. Later, as a junior faculty in an undergraduate institution fostering collaborative research between faculty and students, I was encouraged to share my climate-related research methodology with my students. This led to development of a teaching strategy that integrates the study of climate change into the anthropology curriculum in two specific courses, one oriented toward the past (archaeology) and the other looking at future issues (cultural ecology). In these courses, students use weather data from specific sites in an assigned world region to do trend analyses to speculate on past or future climatic conditions. I developed the acronym CADGAP (Climatic Analogs Data Gathering Project) to indicate which classes would employ that strategy. This paper discusses the pedagogical methodologies involved in bringing CADGAP into the classroom over more than two decades. It also will address the increasing challenges encountered in accessing the data needed to successfully implement this active learning process.

[292] *Tweeting the Flood: Student Social Media Fieldwork and Interactive Community Building*

This paper will discuss hands-on uses of social media to help students engage with climate change. A central case study is an interdisciplinary design course on the Mississippi River and the city, taught in spring 2011 by coauthor Patrick Nunnally in which students confronted historic floods on the Mississippi River in real time through a series of twitter assignments. The analysis will discuss how the assignments were set up and carried out, what happened, and what the outcomes were, in particular related to community building. The paper will address how such real-time observations can add up to data for long-term analysis. Tracked longitudinally, these data can be used to study climate change. The paper will also discuss other opportunities for use of social media and on-line resources for teaching and learning about issues of water, place, and community relevant to climate change.

[292] *Chair*

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Messer, Haley (Florida State University)**[102]** *The Function of Woodland Period Shell Rings as Seen at the Mound Field Site (8WA8)*

What purpose did Woodland period shell rings along the Gulf Coast of Florida hold? These unique architectural features have been explained as specific patterns of trash disposal, protection against flooding events, and as barriers from intruders, among other things, but no answers have stood to truly explain their proliferation and significance during the Woodland period. Recent excavations in 2015 by Dr. Mike Russo (National Park Service) and in 2016 by Dr. Tanya Peres (Florida State University) of areas of the shell ring at the Mound Field site (8WA8) in Wakulla County, Florida, revealed a striking number of features inside and outside of the ring. The frequency and variety of these features provide essential information for research questions regarding the purposes of Woodland period shell rings. This research analyzes particular features at Mound Field to interpret the function of the shell ring and the overall use of the site. These data are then compared with those from contemporaneous sites to examine the origin and purpose of Woodland period shell rings. The information gained from this study is valuable in the growing segment within southeastern archaeology of Woodland shell ring studies.

Meyer, Dominique (University of California, San Diego), Eric Lo (University of California San Diego), Danielle Mercure (University of California San Diego), Patricia A. Beddows (Northwestern University) and Dominique Rissolo (University of California San Diego)**[330]** *Thermal Identification of Groundwater Discharges within Saline Lagoons Surrounding Vista Alegre, Quintana Roo, Mexico*

The Maya port and site of Vista Alegre carried political and trade importance in the Terminal Classic to Early Postclassic periods. Located in the Laguna Yalahau of northern Quintana Roo, Mexico, the site is built on a small and low elevation island surrounded by mangrove. Inland from the site are freshwater wetlands (sabanas), while the near-shore waters of the restricted circulation lagoon are hypersaline. A significant research question is how the inhabitants of Vista Alegre accessed potable fresh water. We investigate this question by exploring the existence of freshwater offshore sinkholes, locally called Ojos de Agua in the surrounding area of Vista Alegre. Through the benchmarking of an aerial UAV based thermal image analysis and calibration at known ojos, we were able to successfully derive salinity variations due to point freshwater discharges in that area of the lagoon. We explain the methodology used to address correct radiometric measurements, thermal image stitching and identification of fresh-water discharge points. While it is still unclear whether such ojos were used for fresh water sources for the ancient Maya, understanding their geology and distribution provides indispensable information for the hydro-geological evolution of the area, and related coastal sites.

Meyer, Kelton (Colorado State University) and Jason LaBelle (Colorado State University)**[127]** *Kill, Camp, and Repeat: A Return to the Lindenmeier Folsom Site of Northern Colorado*

Paleoindians of the Great Plains are often generalized as highly mobile bison hunters that moved in response to migrating bison. This view is certainly shaped by many well-known single component bison kills which form the basis for the argument. The Lindenmeier (5LR13) Folsom site of northern Colorado might be a notable exception to the high mobility model, as it contains hundreds of Folsom tools, animal bone, chipping debris, and decorated artifacts spread over 800 meters of buried deposits. Approximately 9 to 12 dense artifact concentrations are documented across the site, and questions remain as to what these clusters represent—discrete living floors, middens, or palimpsests? Resolving the nature of these deposits is key to integrating Lindenmeier into broader land use models. This presentation summarizes the poorly known locales in the eastern portion of the site. The first discoveries were made here in the 1920s, and the Smithsonian excavated a bison bone bed nearby shortly thereafter. Backed by 10 years of recent systematic artifact mapping, our paper examines what these eastern clusters represent in terms of function, and how these particular occupations mirrored or were instead quite different from the many other Folsom visits to the site.

Michael, Tyler (Harvard University)**[325]** *Resistance and Revitalization in the Native American Southeast*

Revitalization movements have been a topic of particular interest to anthropologists concerned with culture contact and colonialism. As a cultural practice that is present in many historical periods, it stands to reason that revitalization was undertaken in the deep past as well. Archaeology has proven useful in exploring the aftermath of the Pueblo Revolt of 1680 from a Native American perspective in the American Southwest, and recently, scholars have begun to look for potential revitalization movements in the American Southeast. In this paper, I develop a model for assessing revitalization movements on the archaeological record, drawing on scholarship on the Pueblo Revolt and emerging scholarship about a protohistoric revitalization movement in the Mississippian Southeast. I use this model to analyze responses to Spanish colonialism in the sixteenth and seventeenth centuries at the Berry Site, the site of the Native American town of Joara and the Spanish Fort San Juan in modern western North Carolina, and at Mission San Luis de Apalachee, a mission settlement in modern-day Tallahassee, Florida. I then offer tentative conclusions about the nature of response to Spanish colonialism in both case studies.

Michelaki, Kostalena (School of Human Evolution and Social Change, ASU) and John Robb (University of Cambridge)**[54]** *Two Thousand Years of Pot-Making: Exploring Neolithic Ceramic Traditions in SW Calabria, Italy*

This poster will examine the degree to which the task of pot-making changed from the Early/Middle (ca. 5700–5000 BCE) to the Late Neolithic (ca. 5000–4000 BCE) periods in SW Calabria, Italy. We will present the manufacturing sequences of all Neolithic wares, based on the results of more than a decade of stylistic, mineralogical, and physico-chemical analyses of ceramics from the sites of Umbro Neolithic and Penitenzeria, as well as the results of laboratory and replicative experiments using local clays. By comparing continuities and changes in technological decision-making we will explore how the learning and practicing contexts changed.

[256] *Creating a Case for a Classic Period Provincial Polity at Pacbitun, Belize*

The Late Classic period (AD 550–800) at Pacbitun, Belize brought about heightened prosperity evinced in a surge of architectural development and an increase in precious exotic materials. However, despite continued growth, by the close of the Late Classic Pacbitun's affluence appears to have diminished considerably. To the north, settlements of the Belize River Valley also seemingly undergo a concomitant florescence and economic decline. Research suggests the pecuniary instability of the Belize Valley was the result of a semiautonomous existence where interactions with neighboring dominant centers led to episodic subjugation. Thus, an early Late Classic reprieve is thought to have led to a period of independence in the Belize Valley giving rise to florescence. At Pacbitun however, alterations to the site's social, economic, and political institutions may actually support a foreign influence. After reviewing the different incorporation strategies used by paramount centers to control smaller polities, I will detail the Late Classic events at Pacbitun and explain how each institution was effected. Aside from the introduction and intensification of craft and agricultural production, it is my belief that the physical and functional modifications to the site's E Group may be the key to substantiating Pacbitun as provincial polity.

[7] *Ancient Human-Animal Interactions in Chachapoyas Region: Isotopic Analysis of Zooarchaeological Remains from Kuelap, Peru*

This study uses isotopic analysis of fauna remains as a proxy for reconstructing the ancient Chachapoya environment of the northeastern highlands in Peru. Large middens have been excavated at the monumental center of Kuelap (900–1535 CE), yet there is little previous research focused on the fauna remains at this or other archaeological contexts in the region. The goal of this project was to reconstruct animal resource exploitation and provide insight into dietary variation and environment at 3000 masl. This study models animal diets using $\delta^{13}C$ and $\delta^{15}N$ values from bone collagen of various local species including camelids, deer, guinea pigs, viscacha, rabbits, birds, canids, river otter, and puma to investigate the range of isotopic variation within and between animals with different dietary regimes. These faunal isotope values support local expectations for foodweb research and fall into distinct niches in the foodscape of the environment. Differences in diet between domesticated and wild animals (specifically llama and deer) were not identified, suggesting no provisioning from possible domestic crops (maize, C4) by humans. These are the first isotopic data for the eastern montane region and serve as an important baseline in the evaluation of human subsistence strategies and animal husbandry.

[88] *The Battle of the Little Bighorn Gunshot Trauma Analysis: Suicide Prevalence among the Soldiers of the 7th Cavalry*

The Battle of the Little Bighorn cost the U.S. army 268 men, which accounted for just over one percent of its entirety. Many of the men were killed during battle by Native American firearms and bow and arrows (Scott et. al, 2002, pg. 12). It is possible that some men perished by their own hand or by friendly fire. Through osteological data provided by the State Historic Preservation Office of Montana as well as historical documentation, this presentation will provide an analysis of gunshot wound trauma sustained by the soldiers. I will also examine the possibility of suicide among the U.S. 7th cavalrymen. To do so I will compare calibers of firearms used during the battle and the type of wounds sustained by firearms through an extensive literature review of the weapons from this time period. In addition, an analysis of military recruitment and procedures for admittance into the 7th Cavalry will be done to assess mental preparedness for battle. A review of ballistic analysis and typical locations of trauma caused by suicide in a forensic context will also be included. Using historical documents combined with forensic methods will illuminate the possible causes of death for the US 7th cavalrymen.

[239] *Graves in the Forest: Mapping Lost Colonial Cemeteries in the Oyster River Watershed*

The Oyster River watershed in New Hampshire was home to some of the earliest English colonial occupation outside of Boston with settlements starting in the early 1630s. This early colonial occupation as well as subsequent historic settlement of the area has left an extensive array of archaeological features in the landscape. Currently, however, this landscape is heavily forested making identification of even remnant built sites difficult. The forested setting makes it particularly hard to find and correctly identify the extent of early cemeteries given graves were marked only with simple, unengraved fieldstones easily obscured by even slight brush. This poster presents the results of an intensive field survey and mapping program we conducted on one now overgrown early colonial family cemetery used from the mid-1600s to the early 1800s. We contextualize the results of our work with available archival records from the period. By contrasting our results with previous maps of the cemetery, we demonstrate how important the intensive field survey and digital mapping approach developed here is for creating full understandings of these important early sites.

[181] *Objects of Action and the Practice of Empire in Xiongnu Inner Asia*

Material remains of communities and peoples enmeshed in imperial regimes are most often assessed as representations of incorporation into empires. Yet many of the objects in consideration were not so much passive material declarations as they were tools for active demonstrations. Authority, regional and local, derived from membership in exclusive imperial echelons; membership that required more than mere badges of identity but performances of imperially-derived authority. This paper addresses the ways in which locals enacted empire as well as what they sought to gain from doing so. It analyses particular accoutrements of feasting and drinking wielded by steppe peoples of Inner Asia in formalized social interactions aimed

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

at legitimizing authority via participation in the Xiongnu imperial regime. Even though they were often heavily imbued with imperial aesthetics, it was not the cups and bowls alone but rather the practices of drinking ceremonies and eating rituals, afforded by the imperially-imbued objects and the people that wielded them, which bestowed power and authority. The steppe empire was thus constituted through the practices of locally (re)producing the regime, practices that were afforded by assemblies of particular peoples and objects.

Miller, D. Shane (Mississippi State University)

[182] *The Swag Site (38AL137): Yet Another Paleoindian Site at the Allendale Quarries in South Carolina*

The Swag Site (38AL137) was recorded during the initial survey of the Allendale chert quarries by Albert Goodyear and Tommy Charles in 1984. While subsequent work focused on the Topper and Big Pine Tree sites, the Swag site was overlooked until a systematic survey conducted in 2015 identified several localities with buried archaeological deposits. In May 2016 and March 2017, further excavations at the Swag Site produced artifacts that are comparable to Clovis components at Topper, Carson-Conn-Short in Tennessee, and the Adams site in Kentucky. This paper presents the results of mass, refit, and spatial analyses of the lithic debitage in order to assess the impact of post-depositional processes on the archaeological deposits at the site.

[74] *Dating the Emergence and Decline of Middle Woodland Blade Technology*

Prepared core and blade industries emerge in various times and places throughout the prehistory of North America. One of these is in association with the Hopewell phenomenon of the Eastern Woodlands. As such, they are often recognized as a Middle Woodland “index fossil” and a key materialized indication of Hopewell ceremonialism. However, few formal tests of their occurrence across space and time exist. Drawing on published reports, as well as an extensive review of the unpublished gray literature, I present a Bayesian analysis of radiocarbon dated, bladelet-bearing features from across Ohio. Results are not crystal clear but do provide insight into previously unrecognized temporal variation in this element of Hopewell material culture. The most likely current scenario indicates that bladelets occur earliest in southern and central Ohio before subsequently spreading north to the Lake Erie region. There is strong evidence that interactions between groups in Ohio and the Illinois River Valley served as a catalyst for the spread of blades and potentially further elements of Hopewell ceremonialism.

Miller, Heather (University of Toronto) and Gregory L. Braun (University of Toronto)

[121] *Unexpected Expertise: Archaeological Science and the Creative Skills of Indus Craftspeople*

Wright’s doctoral and subsequent work brilliantly employed archaeological science to show how relatively simple technological tools (single-chamber kilns) were used by skilled craftspeople in clever ways to create surprisingly technologically complex objects (black-on-grey pottery, resulting from several different cycles of atmospheric conditions during firing), objects which also provided information about patterns of social boundaries and technological style. In homage to this work, we will present recent petrographic work by Dr. Greg Braun on Mature Harappan technological debris from Harappa, wasters from the firing of faience and/or steatite objects. As in Wright’s research, archaeological science methods show that simple refractory materials thought to be insulating, non-stick firing structures or containers for relatively simple objects, in fact seem to be remains of containers designed to transfer heat, used as ‘crucible’ containers for frits for the production of more complex fritted faiences, with bone fragments deliberately added as fluxes or perhaps even opacifiers. Fritted faience has been identified in the Indus by Vandiver and McCarthy, but this debris implies this complex production method was more common than previously expected, and may be representative of an Indus style of faience production.

[84] *Ground-Penetrating Radar as a Rapid Cultural Resource Management Technique for Shell Midden Delineation*

The analysis of shell midden extent and thickness typically requires expensive and time-consuming excavation. Additionally, widely spaced test units provide limited and discontinuous stratigraphic information. Ground-penetrating radar (GPR) survey, in combination with stratigraphic information from limited excavation, can serve as a powerful tool for making rapid cultural resource management decisions. Although processing and correlating the data requires several days of additional time, this technique allows for quick and efficient data collection, is nondestructive, requires minimal staff, and provides a continuous record of vertical profiles across the site. The contrasting electrical properties of shell-rich horizons and associated sediments allow the identification of midden layers on the GPR records. When used with ground-truth, provided by stratigraphic information from limited excavation (photographs, hand-drawn wall profiles, and/or cores), the interpreter can extrapolate stratigraphic details across a site. While individual artifacts cannot be resolved in GPR records, accumulations of rocks, soil layers, and potential house floors may be identified. Although GPR cannot entirely replace a detailed excavation, an initial GPR survey of a shell midden site can provide information regarding site extent and vertical shell distribution. When combined with limited testing, GPR survey provides important data for decisions regarding excavation and site conservation.

[209] *How Tlaloc Got His Groove*

One of the distinctive features of one of the principal Maya solar deities, the Jaguar God of the Underworld, is the twisted cord—nicknamed “culler” for the German doughnut over 100 years ago by Eduard Seler—that loops under the eyes (with their characteristic inward curl for pupils) and twists between them, sometimes ending under the deity’s jaguar ears. This feature, perhaps to be associated with fire and burning, takes up its place on the nose of a different deity, Tlaloc, in Central Mexico, in the Late Postclassic. How is it that Tlaloc took on this attribute, and what did it mean in the context of the Mexica? No image of Tlaloc from Tula features the culler: in all likelihood the culler takes on its role in the mid-15th century, during the period of Mexica expansion.

In this study, the iconography meaning of the twisted cord will be examined, its meaning in both Maya and Central Mexican contexts, and a possible motivation for transmission. The study will revisit the fundamental union of fire and water at the heart of Tenochtitlan, in the twinned temple of Tlaloc and Huizilopochtli.

[66] *Gender Divisions in Eating and Working: A Bioarchaeological Analysis of an Ancient Muisca Community (Sabana de Bogotá, Colombia, 1000–1400AD)*

The Muisca inhabited a large territory in Northern South America (within present-day Colombia) and are often presented as a “classic chiefdom society.” The roots of these interpretations can be traced back to European historical documents discussing Muisca socio-political life, which emphasized the role of social status and hierarchy within Muisca culture. The Muisca in particular have been held captive by the recordings of historical authors, and social structures observed through a European gaze have colored our interpretations of Muisca culture. New data from archaeological

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

studies of Muisca sites are forcing a reevaluation of chiefdom models. This bioarchaeological study of diet and physical activity, based on 199 human burials from the site of Tibanica (Soacha, Colombia 1000–1400AD), will serve as a case study that focuses on the daily relationships that marked people along divisions between the sexes. Stable isotope analysis of tooth and bone samples indicate consumption of particular foods were tied to one's age and sex. Cross-sectional geometry measures of long bones demonstrate a patterned, gendered division of labor. These divisions in diet and labor indicate that for the Muisca, gender was a very important social variable that united and separated groups in daily spheres of activity.

[122] *Contexts of Ash Deposits in Jornada Mogollon Pithouse and Pueblo Settlements and Reflections on Their Meanings*

The archaeological identification of intentionally deposited layers of ash at Jornada pueblo and pithouse settlements is complicated by several factors and intentional ash deposits are seldom identified unless preserved in a sealed context or buried by a layer of impermeable natural sediment or cultural deposits. When clear evidence of intentional ash deposition is observed, it may be assumed that there was a significant meaning underlying the inclusion of ash in a special context or deposit. Ash is commonly found below adobe caps in sealed floor hearths and termination pits of Jornada pueblo rooms as well as thin layers spread over abandoned and sealed floors. Ash is also associated with layers of burned roof material as part of ritual termination of architecture. Intentional ash deposits have occasionally been found in pithouse floor hearths, and there is evidence of ash layers associated with deposits of ritual paraphernalia in certain caves. Contexts where ash deposits are not present, such as burials and dedicatory deposits, are of further interest because they allow for a comparative contextual analysis. Contexts where intentional ash deposition has and has not been documented will be reviewed and interpretations of the meaning of such deposits will be presented.

[173] *Coba's Periphery and Rethinking Site Boundaries*

Time and again the application of new technologies has allowed archaeologists to rethink their understandings of ancient cultural landscapes. Lidar, in particular, is one technology that has rapidly transformed our analytical capabilities by simultaneously providing wide regional and finely localized views of archaeological sites. In this paper, we present new lidar data that is reshaping our understanding of the Northern Maya Lowland metropolis of Coba. In particular we discuss features on Coba's peripheries that alter previous understandings of Coba's site boundaries and also discuss the possible influence of roads in shaping Coba's site development. Finally, we evaluate earlier models of site boundaries and challenge the concept of a uniform or solitary border that defines a site.

Millhauser, John K. (North Carolina State University)

[170] *Financing the Domestic Economy: A Study of Craft Production and Technological Change in Central Mexico*

Studies of technological change often leave unasked how people finance their adoption of new technologies, focusing instead on concepts of risk and uncertainty. The means of finance—whether by surplus production, saving, assuming debt, sharing costs, or other mechanisms—depends on the particulars of the economy in question and can have systemic and long-term consequences for adopters. To show why finance matters in explanations of technological change and how archaeologists can study it, this paper presents a case of household saltmaking in the Basin of Mexico during the Aztec and Spanish empires. Saltmakers adopted several innovations in the manufacture of vessels they used to evaporate brine, but differences in how they financed these changes had divergent effects on the social relations of production. One set of innovations that reduced ceramic vessel production costs during the Late Postclassic correlates with a period of independence and stability among saltmaking households. However, Colonial-era saltmakers became dependent on wealthier investors for access to the means of production, most likely because they lacked the financial means to adopt an innovation involving metal cauldrons. This research shows the importance of considering finance in explanations of technological change as well as the study of domestic economies.

[179] *Paleopathology and Dental Disease from Point San Jose*

Traditional studies of health and stress in archaeological samples use several categories of skeletal alterations: linear enamel hypoplasias (LEH), adult stature, scars of anemia, dental disease, osteoarthritis, trauma, and infection. Skeletal remains from a late 19th century military hospital at Point San Jose (PSJ), San Francisco, represent a commingled assemblage, complicating paleopathological observations on the bones. Unlike bony changes, dental pathologies are often studied by individual teeth. Consequently, observations of the PSJ dental remains are best interpreted using tooth counts. Dental disease and oral stress at PSJ include dental caries, dental wear, dental calculus, and LEH. Frequency data show that 32/165 teeth (19.4%) exhibit LEH. Most teeth display multiple defects, suggesting repeated early childhood stresses. Additionally, 19/160 teeth (11.9%) show carious lesions. Comparisons of PSJ with other historic samples indicate a similar caries prevalence as the Snake Hill Site (1812–1814) and Indian Wars sample (1870–1899), but a much lower rate than historic British, St. Peter's, Fort Laurens, and Civil War samples. The conclusions drawn from the PSJ dental remains are better indicators of the overall health of the individuals than studies based on bony changes.

[329] *Assessing the Potential for Raw Material Profiling Studies in Modelling Neanderthal Behavioural Complexity*

Raw material studies are becoming increasingly popular as the development of technical and methodological advances adds to the macroscopic and geological study of stone tools. In turn this improves our capability to create a link between a stone tool's archaeological context and geological area of origin. This connection is often discussed in terms of hominin behaviour, such as organisation of subsistence, adaptation to environment, and forward planning. However, the growing body of data provided by provenance research raises the need to critically assess how this information practically translates into proxies of hominin behaviour. This question is particularly prescient when considering the efficacy of raw material studies in exploring the lives of archaic *Homo*, in this case *Homo neanderthalensis*. Middle Palaeolithic foraging behaviour has historically been seen as 'non-curved', lacking a depth of planning and adaptive response to dynamic environments (e.g. Binford 1979; 1982). However, recent advances in our understanding of Neanderthals, suggest a species capable of complex subsistence behaviour, such as transport and curation. This paper discusses raw material acquisition strategies, and how profiles of raw material variability through time and space can contribute to developing models of Neanderthal behaviour.

[98] *All in the Family: Using Archeology and Genealogy to Construct a Historical Narrative*

Excavations during 2017 for Ballintober Castle in Roscommon, Ireland have uncovered the base of a wall structure and curtain wall for the early fourteenth century castle. As excavations continue to deepen, the structure of the castle reveals a complicated occupational history with cobbled floor occupation levels along with what may be a wall structure appearing underneath this area. The castle excavations can show the Anglo-Norman and Irish ownership of the castle with each owner using different building techniques with different purposes for the castle. As the excavations continue to reveal the early construction of the castle, it is important to look at the historical record of the de Burgh and O'Connor families, the two ancestral owners of the land and castle. The Annals of Connacht reveal not only the conflict surrounding the ownership of the castle, but that the families were related through marriage. Looking at the historical narrative surrounding the early construction of the castle highlights the overlooked importance of women in showing not only the conflict over ownership, but that just as the Anglo Norman and Irish walls of the castles are built on top of one another, the competing families are interwoven together.

[328] *Are We Living in a Simulation? Digital Reconstructions of Early Sites in Coastal Peru*

Rapidly evolving modern technology has resulted in powerful tools for preserving and visualizing archaeological materials. Extensively recording a site with digital technologies enables new explorations of site discovery and recovery processes while concurrently providing a permanent, detailed record of the material. Here, Terminal Pleistocene and Early Holocene maritime sites in coastal Peru are reconstructed at various scales. Drone photography and GIS are utilized to collect high-resolution landscape imagery for basemap modeling, while approaches of photogrammetry and 3-D modeling are applied to investigate aspects of the sites at a micro scale. This work demonstrates the dynamic potential of digital curation in archaeology.

[94] *Making Stone Tools to Connect with Past People: A Case Study in Active Learning about Lithics with the Fernandefio Tataviam Band of Mission Indians*

Studies of embodied learning show that physical experiences which engage the sensory and motor processing parts of the brain enhance understanding and retention of concepts. Making an obsidian flake, rather than just seeing pictures of stone tools, is a memorable experience that can provide a tangible connection to the practices of past people. We present a case study in public outreach and pedagogy for the Fernandefio Tataviam Band of Mission Indians of Southern California. The original concept, created in a Lithics Analysis class at California State University, Northridge, was an in-service professional lithics program for the tribe's cultural monitors. The tribe expressed a desire for a presentation that would appeal to all tribal members, including children. Through a family-oriented program, using accessible language and format, workshop participants learned about the deep history of lithic technology, mechanics of working with stone, and what we can learn from this cultural material. During a flintknapping demonstration, participants saw tools being created, watched obsidian slice through leather, and had an opportunity to make their own flakes. After two family-oriented workshops, the Fernandefio Tataviam invited us to conduct a more in-depth, professional program for their archaeological monitors. We present our experiences and lessons learned.

Mink, Philip (University of Kentucky)

[164] *Eastern Virgin Hinterlands: Ancestral Puebloan Settlement in Grand Canyon National Park*

Margaret Lyneis, in her 1995 description of the Virgin Branch region, notes that three of the boundaries are quite distinct as they adjoin "non-Anasazi" societies. The eastern boundary is more diffuse, as the Virgin and Kayenta Puebloan traditions intersect in an area that is now part of Grand Canyon National Park. In this paper I will argue that Virgin settlement patterns in the western half of the Grand Canyon are distinct from the Kayenta and follow the upland/lowland pattern described for the Virgin heartland. I will also discuss preliminary findings that appear to push the Virgin boundary in Grand Canyon National Park eastward from the Kanab Plateau to the Walhalla Plateau, resulting in an increased overlap between the Virgin and Kayenta Puebloan traditions.

[256] *Cataloging Cave Features in the Southern Pacbitun Regional Archaeological Project Using Virtual Reality and 3D Modeling*
Since 2010, a major focus of the Pacbitun Regional Archaeological project has been a regional ritual landscape survey surrounding. In 2016, Phase II of that subproject commenced, with significant efforts geared towards experimenting with digital mapping and documentation of surface archaeological features in four poorly understood caves, Crystal Palace, Slate Cave, Tzul's Cave, and Actun Tokbe. In this paper, we discuss our work and offer some results from our Phase II investigations. In 2016, our efforts were geared toward excavations, tape-and-compass mapping, and photogrammetry experimentation in Slate and Crystal Palace Caves. In the 2017 field season, we cataloged all surface features in Crystal Palace, explored and mapped a small sealed passage in Tzul's Cave, and mapped and cataloged a significant portion of Actun Tokbe, through the use of photogrammetry. Combining the photogrammetric and mapping data with a virtual reality model of the caves provides a robust visualization system allowing remote study of the environment. The resultant "Mapping Grade Models" allow for the rapid inventory, yet detailed mapping of the surface, freeing time for more fieldwork. Such digital documentation relies on careful data organization and backup, annotation of models via coding or other means, and significant time for post-processing data.

[34] *Breadth of Fresh Air: A Continued Examination of the Reversed "Crab-Shell Dichotomy" in Grenada's Pre-History*
In a previous paper, we examined past faunal studies from Troumassoid period (AD 800–1600) sites in Grenada, concluding that an expansion of diet breadth likely occurred during this time. Our conclusion contradicted the traditional "crab-shell" dichotomy proposed by Rainey and Rouse, but confirmed findings from elsewhere in the Caribbean. Presented here is a continuation of this work, with new faunal analyses incorporated from recently excavated inland, western, and earlier (Saladoid) sites, as well as faunal data from a few past reports that were recently discovered. Currently, the data indicate differences between assemblages from the previously examined coastal Troumassoid sites and the recently included inland occupations. A difference was also identified between all Troumassoid sites and the earlier Saladoid settlements. Comparison of the faunal assemblages not only helps to enhance our understanding of Grenada's prehistoric environments, but also the communities that interacted with them. The differences between sites reveal local variations in subsistence strategies over time and further corroborate the transition to an expanded diet during the Troumassoid period.

[333] *Working with Scotty: Perspectives on A Peripheral Paper Designed for the Ayacucho-Huanta Archaeological-Botanical Project*
I was not involved directly with Scotty's Ayacucho project (1969–1975), but from 1965 to 1968 I worked in the town of Quinua, engaged in dissertation research. Its territory included part of the site of Huari. After completing my dissertation, I returned to continue work in 1973, 1974, and 1980, and later, focusing on its ecological system, especially irrigation. Scotty invited me to prepare a paper on the ways farmers used ecological zones. The research, while more detailed, complemented what I had already decided to do. Volumes 2 (Excavations and Chronology, 1981), 3 (Nonceramic Artifacts, 1980) and 4 (The Preceramic Way of Life, 1983) were published; volume 1, which was to include my paper, was scheduled to follow. China (where Scotty began work in 1975) and other work intervened. Volume 1 lay dormant. Many years later, Scotty said he was ready to publish it, but so much time had passed that I thought it necessary to revise. The paper, "Multizone Agriculture in an Andean Village: The Ecological Basis of Peasant Farming", never appeared. It now lies in the National Anthropology Archives. This presentation speculates why, and offers information on what my paper contains and why it is still relevant.

Mixter, David (Binghamton University)

[129] *Urban Reworking as Political Action at the Ancient Maya City of Actuncan, Belize*
This paper begins with a question: What does it mean to live amongst ruins? The literature on ancient Maya urbanism focuses to a large extent on how urban spaces are arranged and what this says about social and political organization. However, the long occupations of many Maya centers resulted in urban centers that reflect a palimpsest of decision-making over centuries rather than a single grand plan. Indeed, evidence at many Maya sites suggests that urban plans were reworked as buildings were built, destroyed, renovated, repurposed, and abandoned based on present needs. So-called "problematical deposits"—detritus left in and on abandoned spaces and buildings—provide evidence that the later Maya acknowledged the differentially utilized nature of their urban centers. Yet, modifications to the urban landscape result from decisions made by someone: households, communities, leaders, or conquerors. As such, palimpsest urbanism is both a way of life and a product of political action. Here, I draw on data from the Maya site of Actuncan, Belize to consider the ramifications of inhabiting and modifying a long-occupied center.

[24] *A New Approach to the Anyang Hsi-Pei-Kang Late Shang Royal Cemetery: A Social Archaeological Perspective*
This presentation argues that the decision of the locations of the so-called royal tombs of the Anyang Hsi-Pei-Kang cemetery involved various social-strategic concerns. Although badly robbed, the excavations of the tombs yielded rich grave good assemblages, allowing archaeologists to approach to various elements of the theocratic authority of the late Shang kings. The reconstruction of the formation process of the cemetery has been attempted in the hope that the tombs can be assigned to the kings whose reigns are recorded in Shiji and in Zhúshū Jinián (the Bamboo annals). Drawing upon an original novel reconstruction of the relative chronology of the tombs, we examined spatial relationships between them at each phase of the formation process of the cemetery, particularly in terms of which pre-existing tombs the mourners were 'designed' to see and in what way, and have analytically revealed some distinct patterns. By comparing the timings of the implementations of those strategies with the genealogical relationships between the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

kings that were recorded in Shi-ji, we have investigated and reconstructed the social-strategic implications of the selections of those strategies in relation to their historical-contextual backgrounds.

[77] *Experimental Reconstructed Vinča Gradac Phase Copper Smelting*

Recent dating projects have determined the oldest known date for copper smelting to appear around, 5000 BCE, associated with Vinča (Gradac phase) sites in the Morava Valley, Serbia. Recent Studies of Vinča metallurgy (Radivojevic 2010) were directed towards the characterisation of slags and associated minerals, and their provenance. This body of work has had important implications for theories relating to the beginnings of metal-using communities.

Despite this important research, few studies have focused on the actual techniques and apparatus associated with copper production, resulting from of a lack of archaeological finds traditionally associated with metallurgical processes.

Some scholars (Šljivar 2006) have proposed the use of perforated and solid truncated conical vessels as primary smelting apparatus. On this basis, a series of experimental smelts coupled with a program of soil and material analysis were initiated to explore the potential for such vessels to be associated with copper smelting. This paper reports a number of experimental smelting campaigns and evaluates the potential for these early ceramic forms to be associated with the world's earliest pyrometallurgical tradition.

[10] *El Niño and Trans-Holocene Trends in Eastern Pacific Fishes: Preliminary Data from Abrigo de los Escorpiones, Baja California*

Many questions surround trends in prehistoric fisheries dynamics and fish use along the Pacific Coast of North America. Marine fish are particularly sensitive to changes in their environment, including variation in sea surface temperature that changes cyclically with the El Niño/Southern Oscillation.

Trans-Holocene paleontological or archaeological sites with large faunal assemblages are the ideal tool for use in reconstructing these paleoenvironmental records. Here, I report preliminary data from Abrigo de los Escorpiones, a well-dated and stratified trans-Holocene site from the Pacific Coast of Baja California. A wide variety of fish taxa were identified, including a large proportion of surfperch (Embiotocidae). Rockfish (*Sebastes* sp.), sharks and rays (Elasmobranchii), and California sheephead (*Semicossyphus pulcher*), were also identified in this assemblage. Richness and evenness values were calculated as they have the potential to reflect El Niño frequency; higher values through time could indicate an expanding diet breadth due to decreased encounter rates with the highest-ranked fishes. A significant increase in evenness values through time was revealed, which correlates with the increase in El Niño frequency in the late Holocene. This work has modern value; reconstructing an extended record of marine environmental change can inform on modern rehabilitation and conservation efforts.

Mohr, Katelyn

[92] *Late Pleistocene and Early Holocene Lake-Level Fluctuations in the Lahontan Basin, Nevada: An Expanded Approach*

In the Great Basin, most substantial Paleoindian sites are found on landforms associated with extinct lakes and wetlands, suggesting that early groups had a special affinity for lacustrine settings. The Lahontan Basin of western Nevada contains a rich record of Terminal Pleistocene and Early Holocene (TP/EH) lake-level fluctuation and an extensive record of Paleoindian occupation. In 2008, Ken Adams and colleagues compared the relationship between site location and lakeshores of known ages using a small number of Paleoindian sites in the Black Rock Desert and Winnemucca Lake basins. They argued that sites dating to between ~13,000 and 8,000 years ago should be concentrated at elevations between 1200 and 1235 m ASL. Their research relied on a small archaeological data set from a limited geographic area. To test their hypothesized relationship between site distribution and lakeshore elevation, I compiled site location data for the entire Lahontan Basin. My results shed additional light on the spatial-temporal relationship between Paleoindian sites and Pleistocene lakeshores and help evaluate the validity of their model at a much broader scale.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Monahan, Ellis (Cornell University)**[146]** *Enclosure and Surveillance: The Development of a Disciplinary Landscape in Bronze Age Cyprus*

Monumental architecture, specifically in the form of structures classified as "fortifications," emerged on Cyprus at the end of the Middle Bronze Age, but these massive constructions remained in use for only a brief period of time. This period, however, is of critical importance to the transformation of Cypriot society from a relatively egalitarian village-based society to the urban-focused, politically complex society of the Late Bronze Age. Using the cluster of fortresses in the Agios Sozomenos region in central Cyprus as a case study, and presenting the results of recent field work in this region, this paper considers not just what these structures are, but what they do and how they do it. This material agentive approach demonstrates that fortresses are efficacious actors within the political domain, shaping the human imagination and experience of the landscape, and thereby driving the apprehension of inequality and contributing to the restructuring of social relations.

Monnier, Gilliane (University of Minnesota)**[137]** *Lithic Residue Analysis in 2018: Prospects and Challenges*

Lithic residue analyses have produced exciting results in recent years: microscopic bits of plant and animal tissue adhering to stone tools tens of thousands of years old; the remains of hafting materials such as bitumen and birch-bark pitch; and fiber technology from the Paleolithic, to mention but a few. Yet, for many archaeologists these results seem 'too good to be true'. How can biological materials be preserved for thousands of years in temperate environments? How can they appear, under the microscope, almost intact after all of this time? And, how can we be sure that residues are ancient, and not modern contaminants? These questions are at the heart of recent research in the field of lithic residue analysis. In addition to blind tests and anti-contamination protocols, important advances have been made in the development of new analytical techniques designed to improve the characterization of residues. Scanning electron microscopy (SEM) provides high-resolution images with chemical compositional information. Fourier Transform Infrared Microspectroscopy (μ FTIR) is such a sensitive technique that it can document degraded proteins. This paper will discuss the role that the development of such techniques will play in helping tackle the problems of identification, contamination, and preservation mentioned above.

Monroe, Cara (University of Oklahoma- LMAMR), Paul Sandberg (Sam Noble Oklahoma Museum of Natural History), Rita Austin (University of Oklahoma- Laboratories of Molecular), Marc Levine (Sam Noble Oklahoma Museum of Natural History) and Cecil Lewis (University of Oklahoma- Laboratories of Molecular)**[143]** *Ancient DNA Analyses of Dental Calculus from Plains Village Collections*

More than a generation since the implementation of NAGPRA, many museums continue forward with the process of repatriation. This creates a unique opportunity for active and collaborative engagement of Native American communities in both the inception and implementation of scientific research. Biomolecular analyses of dental calculus can be an attractive research avenue because they address questions of mutual interest to tribes and scientists, and the sampling techniques are non-destructive to human tissue. In partnership with a tribe in Oklahoma, we present preliminary ancient DNA and bioarchaeological data from prehistoric dental calculus from three Washita River phase, Plains Village sites (500–700BP).

Monroe, Cara [14] see Wright, Sterling

Monroe, J. Cameron (University of California, Santa Cruz)**[337b]** *Towards an Archaeology of Black Atlantic Sovereignty: Materializing Political Agency in the Kingdoms of Dahomey and Haiti*

The Archaeology of the African Diaspora has long privileged the analysis of the everyday lives of enslaved Africans living on plantation sites in the New World. Notwithstanding the political and intellectual importance of this approach to our understanding of the emergence of the colonial world and its contemporary legacies, recent scholarship on both sides of the Atlantic has examined the new political entities that arose across the Black Atlantic World in dynamic tension with broader Atlantic political and economic forces. Such work has highlighted how political authority in emerging Black Atlantic states were materialized at multiple scales of analysis, and in complex relationships with colonial societies. In this paper, drawing from comparative archaeological research on the Kingdom of Dahomey (Bénin) and the Kingdom of Haiti (Haiti), I will explore the potential for an archaeology of sovereignty in the Black Atlantic World. Emphasizing the economic and symbolic nature of both architectural spaces and artifacts recovered from the homes of monarchs in these two polities, this paper reveals the complex ways sovereign states were articulated into the broader economic and political currents of the Atlantic World, casting new light on the problematic nature of political sovereignty in the Age of Revolutions.

Monroy-Rios, Emiliano [330] see Beddows, Patricia A.

Montero, Gabriela (University of Kentucky), Nathan Wilson (Universidad Nacional Autónoma de México) and Lourdes Budar (Universidad Veracruzana)**[285]** *Obsidian Exploitation and Access in the Eastern Sierra de los Tuxtlas, Veracruz, Mexico*

In this paper, we present the results of technological and visual sourcing analyses of over 1000 obsidian artifacts collected by the Proyecto Arqueológico Piedra Labrada (PiLab), directed by Dr. Lourdes Budar. The PiLab area of study, the eastern Sierra de los Tuxtlas, Veracruz, Mexico, includes the eastern flanks of the Sierra de Santa Marta and the adjacent coastal plain along the Gulf of Mexico, and has a long sequence of Prehispanic occupation. Despite this, and almost a decade of regional survey and targeted excavation by PiLab, relatively low quantities of obsidian artifacts have been recovered within the study area. In our analyses of obsidian exploitation, we focus on evaluating both the overall quantities of obsidian artifacts recovered and their specific uses. Our results suggest that access to imported obsidian was rather limited throughout most of the region of study.

Montgomery, Barbara [325] see Lyon, Jerry

Montgomery, Lindsay (University of Arizona)**[259]** *The Social Lives of Horses: Comanche Equestrianism in New Mexico*

Over the past century, a great deal of scholarly attention has been paid to Plains horse culture, particularly focusing on how horses transformed the economic practices of nomadic people and the ecology of the Great Plains. As one of the most iconic equestrian cultures of the eighteenth century, the Comanche have been a common subject of these anthropological and historical investigations. Recent studies of the Comanche have focused on the role of horses in facilitating their rise from small-scale hunter-gatherers into major economic and political players. Although the impact of horse on

Comanche culture was certainly profound, emphasizing the functional effects of horses glosses over other important elements of the human-animal relationship. Indigenous approaches to human-animal relations offer one alternative interpretive lens to these traditional lines of inquiry. Indigenous philosophy is holistic and places humans and animals on the same behavioral continuum, merging the distinction between nature and culture, the functional and the social. This paper draws on indigenous philosophy to interpret a growing body of Comanche rock art in the Northern Rio Grande region. Through a discussion of this material archive, I explore the social life of horses within Comanche culture and the material manifestations of this relationship.

Montgomery, Rebekah (Binghamton University)

[17] *Ephemeral Objects: An Alternative Perspective on the Maquetas of San Jose de Moro*

This presentation examines the collection of unfired clay models, or maquetas, from the Moche site of San José de Moro, Peru, proposing an interpretation focused on their unique materiality and position within the artistic corpus at the site. A renewed focus on Moche architectural representation treats these three-dimensional models as miniaturized, mimetic sculptures of monumental buildings, often used to understand the function of ceremonial space in the past. As of 2012, fifty maquetas have been uncovered from twelve elite tombs at San José de Moro. These burials range from the Late Moche Period (AD 650–800) through the Transitional Period (AD 800–1100). Prior investigators argue that the models served as effigies of ceremonial structures significant to the life of the deceased. The ephemeral materiality and privileged appearance of maquetas remain constant over multiple centuries despite changes in their form and frequency within elite tombs. Maquetas are also represented in the Burial Theme found on multiple fineline vessels from San José de Moro, suggesting the importance of the maqueta in funerary process. I explore the agency of these transitional objects and consider the significance of architectural representation in the elite burials.

[204] *City of (Inconvenient) Cemeteries: A Brief Synopsis of the Disturbance of Historical Burial Grounds in Philadelphia*

Philadelphia's many unmarked cemeteries and burial grounds have been repeatedly disturbed by construction activities in a string of incidents that stretches back more than 200 years. Incredibly, despite the regular discovery of these unmarked graveyards, City officials and local government agencies still make no effort to proactively protect these resources, and profess a wide-eyed bewilderment each time another one is impacted. Likewise, those responsible for disturbing burial grounds invariably feign exasperation and ask, "How could we have known?!" This presentation provides an overview of Philadelphia's unmarked burial grounds and their history of being disturbed, examines how they become lost in the ever changing city scape, and addresses the reasons why they should be easy to anticipate and avoid.

[328] *Fishing at the Beach: The Great Neck Site and an Examination of Subsistence Strategies on the Chesapeake Bay*

Excavations conducted in 2015–2016 at the Great Neck site (44VB7) in Virginia Beach yielded evidence of a Middle Woodland occupation dating to AD 400. Located on Wolfsnare Creek approximately one mile from the Chesapeake Bay, the site contained a postmold pattern from a small structure, many small and shallow basin-shaped features, and several large pit features. Two of the larger pit features exhibited excellent bone preservation and were densely filled with a mix of aquatic and terrestrial fauna including large amounts of oyster, clam, and fish remains. Many of these specimens can be identified using traditional methods (i.e., comparison with a reference collection). The results of flotation from these two features, however, yielded tens of thousands of small fish vertebrae not typically identifiable using morphological characteristics alone. The Virginia Museum of Natural History archaeology program has developed a small and relatively inexpensive molecular lab to determine the feasibility of extracting DNA to identify these vertebrae to expand our understanding of resource use at the site, seasonality of occupation, and fishing methods. DNA testing results will be presented along with their impact on our interpretation of the site and the examination of persistent subsistence strategies in the Chesapeake Bay area.

[165] *Making Andean Houses: A Comparative Case Study*

Dwellings occupy a unique space in human lives, places where multiple trajectories of 'Culture' and 'Nature' intersect. Not merely shelters, dwellings often incorporate subtle aspects of social life and world view while being literally structured by the capacities of raw materials and construction techniques. Rather than a passive reflection of human intention or social existence, dwellings result from making—to use Tim Ingold's notion, a perspective placing "the maker from the outset as participant in a world of active materials" in which the maker intervenes "in worldly processes that are already going on and which give rise to the forms of the living world." Methodologically, 'making' is "read longitudinally, as a confluence of forces and materials, rather than laterally, as a transposition from image to object." Further, the transformations of ancient dwellings into archaeological features and contexts engage with additional modes of 'making' as houses become sites. I apply these concepts to two different classes of late prehispanic dwellings in coastal Peru—casas de quincha in the Casma Valley and tabique dwellings in the Tumbes Valley—and discuss analytical challenges involved in a comparative study of Andean houses and households.

Moore, Mark (University of New England)

[227] *Experiments in Stone-Flaking Design Space and Implications for Social Learning Models*

Social learning by modern humans led to the repetition and persistence of stone tool forms we see in the recent archaeological record. The emergence of similar patterning in early hominin assemblages is often assumed to track the beginnings of social learning. Less clear is what was being socially transmitted during this early period. One possibility is that hominins learned how to make objects according to a shared 'mental template'. A second possibility is that specific sequences were learned, which led to repeated forms. Here we describe recent experiments that explored the interplay of stone-flaking intentions and the mechanical outcomes of fracture. By removing complex 'intent' from the experimental design, we demonstrated that repetitions in forms and sequences can occur by removing flakes in simple series, without complex goal-directed intentions, and that some of these forms mimic aspects of objects often assumed to reflect more complex cognitive processes. The emergence of repetitive form is possible through the transmission of simple stoneworking sets, or combinations of gestures, without an a priori conception of a manufacturing process or final goal, suggesting that complex forms of social transmission may not have been necessary until relatively late in evolutionary history.

Moore, Summer (College of William & Mary)

[20] *Continuity and Change in Early Colonial-Era Hawai'i: An Examination of Foreign Artifacts from Nu'alolo Kai, Kaua'i Island*

Archaeologists increasingly emphasize the role of social and cultural context in understanding how indigenous groups in colonial settings appropriated foreign goods. While documentary accounts of explorers, traders, and missionaries have long been used by Pacific historians to examine foreign trade in Hawaii's early colonial period, archaeological sites from this period have rarely been identified. As a result, we know little about how foreign goods acquired through such exchanges were actually used and understood by local Hawaiian communities. A legacy collection of foreign objects from Nu'alolo Kai, a deeply stratified residential site on Kaua'i Island occupied through the mid-nineteenth century, offers a unique source of information on this topic. Protected deposits at the base of a cliff preserved a remarkable assemblage of imported materials in the site's upper layers, which include

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

copper, iron, glass, ceramics, cloth, and Bible pages printed in the Hawaiian language. While foreign goods at indigenous sites have often been taken as evidence for transformative change, more recent views highlight the ways that unfamiliar objects can be recontextualized in new settings. This paper argues that residents of Nu'alolo Kai appropriated foreign objects within a framework characterized not only by innovation but also by pervasive continuity.

Moots, Hannah (Stanford University)

[295] *Towards a Recursive Relationship between Archaeological and Evolutionary Theory*

In 1875, archaeologist Augustus Pitt-Rivers wrote, "History is but another term for evolution." This presentation will explore the development and trajectory of major schools of thought concerning the relevance (or lack thereof) of evolutionary theory to archaeology and examine the current debate about the nature of evolution occurring in the biological sciences. Lactase persistence, for example, has been intensively studied for nearly 30 years, yet new evidence is calling into question when and how lactase persistence emerged. New archaeological, biological and theoretical approaches are rewriting and refining our understanding of this history. Using this and other examples related to histories of food tolerance and intolerance, I will explore ways that archaeology can and should contribute to an evolutionary theory where research on human history and long-term social change play a foundational role.

[44] *Using Faunal Stable Isotopes to Assess Past Hunting Practices and Landscape Modification along the Feather River, CA*

Isotopic studies of faunal remains provide an ecological framework from which to interpret human behavior, including diet, subsistence, settlement, and mobility. In this study, we present isotopic analysis of four well-dated sites that span a 3500-year record along the Feather River, the biggest tributary of the Sacramento River located in Northern Central California. Through carbon, nitrogen, and sulfur stable isotopes we explore the effects of human population growth on the type(s) of browse that was available for game, as a reflection of landscape modification and maintenance. As well, we hypothesize that as populations grew regionally, game came from a smaller territorial range, and use changes in intra-species isotope variation to evaluate this hypothesis.

[299] *Aportes a la Interpretación Arqueológica de la Zona Sur en Honduras*

Los departamentos de Choluteca y El Paraíso al sur de Honduras cuentan con un escaso registro arqueológico de asentamientos prehispánicos y coloniales. El desconocimiento de su historia deriva constantes saqueos y destrucción arqueológica, alterando el patrimonio cultural y generando un vacío histórico a las comunidades aledañas a estos sitios arqueológicos, desvinculándolas con su pasado. El Proyecto Arqueológico El Paraíso y Choluteca (PAPCH) comienza en el año 2016 como parte de los procesos de formación de estudiantes de pre-grado en la Carrera de Antropología de la Universidad Nacional Autónoma de Honduras. Este tiene como propósito conocer y documentar la ocupación prehispánica en la zona sur delimitada en un polígono de aproximadamente 365 kilómetros cuadrados. A inicios del año 2017 se realizaron los primeros reconocimientos arqueológicos, identificándose más de quince sitios arqueológicos. La evidencia material registrada fue documentada, preclasificada y analizada y como resultado se muestran patrones relevantes para la comprensión de la zona sur en Honduras. Entendiéndose que las sociedades no son órganos aislados de su contexto general, se propone la posibilidad que las poblaciones en la región sur participaron en relaciones de largo alcance entre sociedades al norte y centro de Nicaragua así como al centro de Honduras.

[337] *The Architecture of the Classic Maya Regal Palace of La Corona, Guatemala*

The regal palace of La Corona flanks Plaza A to the west and is the largest construction at the site: a complex of structures sitting atop a sustaining platform extending over ca. 80 x 55m, and 7m in height. This paper describes the architecture of the two northern groups of the regal palace during their two last phases of construction, spanning roughly 750–850 A.D. While the Northeast Group comprised elaborately decorated corbel-vaulted buildings, the Northwest Group featured a mix of sturdy corbel-vaulted rooms and semi-perishable structures. This paper focuses on architectural designs, layout, and features, allowing to reconstruct the functions of the buildings, which include: residential, economic, administrative, ceremonial, and communicational functions. This functional study informs on what activities were performed in this ancient political institution and how those changed over the course of the last century of occupation of this ancient polity.

Morehart, Christopher (Arizona State University)**[230]** *Cosmologies of Ruins and Ruination: Infrastructures and the Anthropocene*

Scientists debate the Anthropocene as a geological epoch. But as a cultural phenomenon, the Anthropocene projects a cosmology across history. This paper specifically examines how this cosmology understands the materiality of infrastructures, the built substrate upon which networks of human and non-human worlds intersect and collide. I argue that this cosmology contrasts infrastructures of the recent past as dangerous and polluting against infrastructures of the distant past as sacred and pure. This paper approaches this matter via the analysis of archaeological, historical, and ethnographic data over the past 1000 years in the Basin of Mexico. This case is particularly relevant because this region's landscapes, places, and people both have defied and haven fallen within the limits of the Anthropocene cosmology. The development in infrastructures tied to varying institutional systems has always had to encounter—physically, socially, and culturally—the materiality of precedent, a trajectory that shows the Anthropocene is not simply geological or cultural but also is political. The need to project a cosmology of sustainability onto the present and into the future depends upon how the Anthropocene's ideal and contrasting categories are strategically deployed.

Morehart, Christopher [101] see Mejía Ramón, Andrés

Morell-Hart, Shanti (McMaster University)**[163]** *Changing Plant Economies and Diverse Plant Practices at Piedras Negras*

Botanical residues recovered from the Piedras Negras kingdom have yielded rich information about activities and economies of ancient inhabitants. Data for this paper were derived from large-scale excavations targeting Classic Period craft production areas, defensive features, and dwellings. Evidence of agricultural practices as well as the collection of wild and fallow-dwelling plants has been revealed through charred seeds and other botanical residues. The recovered archaeobotanical remains indicate the use of several typical economic species, as well as a range of uncommon plants that may have been used for various purposes including medicine, ornament, and trade. Moreover, the distribution of species across the landscape informs our understandings of place-making in terms of distinctiveness or overlap in activities at individual loci. The diversity of practices represented by the botanical remains adds nuance to traditional paradigms of Classic Period ethnoecology and economy in the Usumacinta region.

[76] *Discussant***Morello Repetto, Flavia (Instituto de la Patagonia, Universidad de Magallanes), Marta Alfonso-Durruty (Universidad Alberto Hurtado, Departamento de Antro), Tom Amorosi (American Museum of Natural History, USA), Victor Sierpe (American Museum of Natural History, USA) and Manuel J. San Román (American Museum of Natural History, USA)****[155]** *Junius Bird Collections from Sites Rockshelter 1, 2 and 3 (Beagle Channel, Patagonia, Chile)*

Between 1933 and 1980 Junius Bird, researcher from the American Museum of Natural History (AMNH) New York, traveled through southern Chile where he carried a wide array of archaeological excavations and studies. Towards the beginning of this period, Bird conducted extensive excavations in three sites in the Southern most region of Fuego-Patagonia. Collections from these sites are currently housed at the Division of Anthropology AMNH, and were recently analyzed as part of the activities of Grant FONDECYT 1140939.

The sites are located in Tierra del Fuego and the Navarino islands (east and west of the Beagle channel respectively). These sites, Rockshelter 1, 2 and 3, are large shell middens associated with rock shelters. Lithic and bone technology information from the collections is presented and assessed. Data collected from the assemblages is compared to the records and the scarce information of these archaeological sites extant today. The results provide a general overview of archaeological marine hunter-gatherers, highlight the importance of raw materials among them, and further inform about their distinctive technological traits during the second half of the Late Holocene. Subsistence, stratigraphic and context information is based on the detailed record of Junius Bird's field notes.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Moretti, John (Museum of Texas Tech University) and Eileen Johnson (Museum of Texas Tech University)

[188] *The Late Pleistocene (Rancholabrean) Vertebrate Local Fauna from Zone 3 of Kincaid Rockshelter (41UV2), Uvalde County, Texas*
Kincaid Rockshelter (41UV2) is a stratified, multi-component archaeological site spanning the late Pleistocene-Holocene in Uvalde County along the Sabinal River in south-central Texas. Texas Memorial Museum investigations in 1948 produced a small but relatively diverse sample of late Pleistocene (Rancholabrean) vertebrates from the lacustrine Zone 3 depositional unit. Zone 3 material was examined as part of a review of American lion (*Panthera leo atrox*) remains from Texas. New qualitative and quantitative observations demonstrated the presence of two forms of extinct horse (*Equus mexicanus*, *E. francisi*), dire wolf (*Canis dirus*), American lion, yesterday's camel (*Camelops hesternus*), ancient bison (*Bison antiquus*), mammoth (*Mammuthus*), alligator (*Alligator mississippiensis*), softshell turtle (*Trionyx*), pond turtle (*Trachemys scripta*), and extinct box turtle (*Terrapene carolina putnami*). While the presence of American lion in Zone 3 was confirmed, reported jaguar (*Panthera onca*) remains were re-assigned to *Panthera leo atrox*. Zone 3 specimens placed the American lion in the Balcones Escarpment, a diverse modern ecotone between the rugged Edwards Plateau and the Gulf Coastal Plain. In combination, four confirmed records of *Panthera leo atrox* extended across Texas, from the Southern High Plains to the Gulf Coast, evincing the versatile ecology of this dominant Rancholabrean carnivore.

Moretti-Langholtz, Danielle (College of William & Mary) and Buck Woodard (American University)

[255] *An Evidence-Based Reinterpretation of the Brafferton Indian School*
The 1693 Charter establishing the College of William & Mary in Virginia, includes a mandate to educate the "Western Indians." After securing funding for the Indian school from the estate of the scientist Robert Boyle, a magnificent Georgian-style structure was built to house the "Indian boys." The received history about this endeavor maintains that the Indian school at William & Mary was unsuccessful. Documentary evidence from both sides of the Atlantic, as well as archaeological evidence, situates the Brafferton Indian School within the Atlantic World's network of trade, politics of church and state, and offers new insights into the legacy of the Brafferton Indian School among descendant communities with ties to the eighteenth-century school.

Morey, Darcy [212] see Jeger, Rujana

Morgan, Brooke (State Historical Society of North Dakota)

[124] *When Window Mesh Is Worth It: Assessing the Potential of Microrefuse in Spatial Analysis of Hunter-Gatherer Sites*
The smallest pieces of chipped stone flaking debris are often overlooked in the analysis of hunter-gatherer camps. Several factors account for this, including recovery methods, research focus, and time and cost allotted for a project. At shallowly-buried sites where features have been obliterated, concentrations of microrefuse have the potential to reveal in situ activity areas or secondary deposits formed by batch dumping. This paper presents a case study of the Mountaineer Folsom site near Gunnison, Colorado, to illustrate the interpretive value of flakes <2 mm in maximum dimension. Results indicate that, while time-consuming, performing spatial analyses at this resolution provides insight into human behaviors that would go otherwise undetected in the archaeological record. At Mountaineer in particular, small flakes reveal how hunter-gatherers perceived and used the space associated with a dwelling structure.

Morgan, Christopher (University of Nevada, Reno)

[174] *High Altitude Settlement as Evolutionary Process*
The peopling of high altitudes and altitude's ecological analog, high latitude, are critical to understanding worldwide human dispersals and the diversity of human adaptation but are still quite poorly understood. Within this context, this paper presents a model for the initiation, establishment, and maintenance of permanent high altitude settlements, especially in middle latitudes. This model takes into account the limiting factors found in such settings, the costs and benefits of different ways of coping with these limitations, and the contexts under which different behavioral strategies and physiological changes might be expected to be selected either for or against. The model is evaluated with archaeological data from the Rockies, Intermountain West and the Argentine Andes. This evaluation suggests that in most scenarios demographic packing triggers increasingly intensive high altitude use, that establishing semi-permanent or permanent settlements requires economic subsidization with lower-altitude resources and increasingly costly high altitude ones, and that maintenance of high altitude lifeways is tenuous and contingent upon both biological adaptation and/or articulation with larger regional economies.

Morgan, Robert (USDA Forest Service, Francis Marion National Forest)

[106] *Identifying Cultural Landscapes in Wilderness Areas on the Francis Marion National Forest*
Wilderness is often interpreted to mean areas of pristine nature lacking evidence of human activity. But how realistic is this view given the length of human occupation where many endeavored to mold the landscape to suit their needs? The Francis Marion National Forest is positioned at the northern end of the Sea Islands Coastal Region of the South Atlantic Slope and contains four designated wilderness areas. Given the size and condition of the two largest wilderness areas the Forest Service employed remote sensing techniques to quickly identify cultural landscapes within areas. The most expeditious technique was to use of the forest's hillshade images derived from digital elevation models. This provides a visual scene of what the bare earth looks like. Grayscale and color ramps are used to display the hillshaded elevation model revealing extensive landscape modification within the wilderness areas.

Morgan-Smith, Mary (University of North Carolina at Chapel Hill)

[170] *Ts'uul y Páalitsil: Considering the Role of Debt at Rancho Kiuc, Yucatán, México*
The accumulation of debt by Maya speaking laborers has long been understood as integral to Yucatán's hacienda system in the 19th century. Though the contexts and nature of creditor-debtor relationships are variable and contested, evidence for debt is consistently present in documents related to large, corporate estates. But what does indebtedness look like beyond the hacienda on small-scale estates? In the absence of historical documents, or evidence of a company store, can debt be observed materially? This paper examines the role of debt in the relationship between landowners and laborers at Rancho Kiuc (ca. 1760–1950); a small, privately-owned cattle ranching estate in the Puuc Hills of Yucatán, Mexico. Owned and worked by generations of Maya speakers, narratives of indebtedness to the Rancho's owners are woven throughout the oral history of the community. Inequalities evident in the site's household assemblages will be considered alongside the social memory of labor relations at the Rancho in exploring debt's role in sustaining the Rancho's laborer population.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Moriarty, Ellen (Community College of Vermont) and Matthew Moriarty (Castleton University)

[168] *Kindling Curiosity: Assessing the Early Results of Educational Outreach and Archaeology in the South Lake Champlain Basin, Vermont*
Members of the general public often view local prehistory from an artifact-based perspective, with a limited or incomplete understanding of the people who made and used such items. This view of the past is often paired with misunderstandings about both the nature of ancient settlements and the need to protect them as vital cultural resources. Initiated in 2016, the South Champlain Historical Ecology Project (SCHEP) has two goals: to study patterns in human-environment interaction along the southern Vermont shore of Lake Champlain, and to increase local knowledge of the substantial cultural heritage resources within the project research area. The SCHEP study area is remarkable in terms of both its ecological diversity and tremendous time depth of human activity, providing an excellent platform from which to kindle curiosity, engagement, and increased protection within local populations. This paper discusses one major component of SCHEP's outreach activities: work with students in elementary, high school, and colleges in the study area. Using the results of surveys collected during a program of school and field visits, we consider the attitudes and impressions of youth and young adult participants towards local prehistory both before and after their work with SCHEP.

Moriarty, Matthew (Castleton University), Ellen Moriarty (Community College of Vermont), Rosy Kirk (University of Vermont) and Bryant Garrow (Castleton University)

[301] *At the Gateway to Vermont: Recent Investigations at the Galick Site, West Haven, VT*
In 2016, the South Champlain Historical Ecology Project (SCHEP) initiated investigations at the Galick Site as part of a regional study focusing on long-term human-environment interaction within the South Lake Champlain area. Situated at the confluence of long-distance trade routes and within an area of remarkable ecological diversity, the Galick Site constitutes a key setting for examining historical ecology at the southern end of Lake Champlain. To date, SCHEP has conducted two field seasons at the Galick Site, analyzed more than 1,000 artifacts collected by the site's previous landowner, and completed a range of spatial and technical analyses. These investigations have revealed the Galick Site to be a large, multicomponent campsite and settlement used extensively from the Late Paleoindian period up to the Historical era, with particularly heavy usage during the Middle to Late Woodland interval. These investigations also provide initial confirmation for earlier suppositions that the Galick Site served as an important central place for a wide range of economic and social activities occurring within the South Lake Champlain area.

[259] *The Wolf under the Plaza: Pastoralism and Predation in Spanish New Mexico*
The nomadic tribes of the Plains—notably, the Comanche and Apache—are typically considered the main obstacles to the northern expansion of the Spanish empire in North America. But early Spanish settlers in New Mexico found themselves up against another formidable foe that has received far less attention in the literature: the wolf. Indeed, for an expanding pastoral society, the wolf posed perhaps the biggest threat to local economic welfare. In this paper, we report on the recent discovery of a double wolf burial dating to the 17th or early 18th century in the town of Dixon. Our analysis casts a spotlight on the threat these canids posed to early herders in the region and provides an opportunity to reevaluate the role of the wolf in Southwestern pastoral society more generally.

Morrison, Blythe (Northern Arizona University)

[187] *An Investigation of Ancient Turkeys near Houck, Arizona*
This research explores microscale patterns of human-avian interaction in the prehispanic Southwest by identifying evidence of *Meleagris gallopavo* (turkey) use at a series of multicomponent sites near Houck, Arizona. Using legacy field notes, maps, photos, and artifacts housed at the Museum of Northern Arizona, I provide information about the spatiotemporal contexts of turkey remains at the Houck site cluster. The area of focus was primarily occupied between AD 800–1250, before and during the transitional period when turkeys became nutritionally significant to local populations. The presence of Chacoan masonry at one of the larger habitations indicates linkage with a larger cultural phenomenon. When the sites were excavated during a highway expansion project in the early 1960s, turkey remains were found in a number of different archaeological contexts. Using spatial analysis, faunal evaluation, and ethnographic review, I identify trends in turkey presence over time. I analyze use patterns by engaging concepts of behavioral archaeology, domestication theory, and multispecies ethnography. This research provides innovative information on the range of relationships between Ancestral Pueblo people and turkeys in the ancient Puerco Valley and the implications that the Houck community provides within the larger picture of avian domestication in the American Southwest.

[213] *6k Years of Land Use in South Asia: Sustainability, Power Relations, and Tropical Variability*
Tropical environments vary significantly in terms of rainfall and seasonality; these differences make a difference in the kinds of land use strategies that work over the long term. This paper reviews some of the opportunities and constraints of tropical environments in South Asia, considering the range of land use practices deployed over the last 6,000 years in this region. I argue that some practices which could be called sustainable also come at a high cost in terms of human dignity, particularly intensive farming associated with significant social inequity. Other land use practices support more egalitarian social forms, but under conditions of limited population density. We have much to learn from the historical experiences of the tropics—one of these is certainly the ambiguity of the notion of sustainability.

Morrisset, Sara (University of Cambridge), David Beresford-Jones (University of Cambridge) and George Chauca (National University of San Marcos)

[335] *Echoes in the Wake of Collapse: Cultural Connectivity during the Middle Horizon to Late Intermediate Period in the Lower Ica Valley, Peru*
This paper examines what happened to cultural connectivity on the south coast in the wake of Wari's collapse based on our ongoing investigations at the site of H-8 in the lower Ica Valley. We investigate in particular how the echoes of the Middle Horizon resonate in the genesis of the Late Intermediate Ica culture that emerged here thereafter. We present evidence that H-8 was first founded at this time (c. 1000CE), and operated as a caravanserai within an intensifying network of trade and exchange articulated by camelid caravans between a number of Ica Valley sites throughout the LIP. Lyon (1966) argues that the beginning of the LIP was marked by a revival of Middle Horizon iconography, suggesting particular cultural or political value of this period to the people of Ica. Moreover, the remote oracle/pilgrimage center of Pachacamac on the central coast appears to have exerted particularly powerful influence on Ica during the Middle Horizon, but also thereafter on the developing regional culture in Ica. This poorly understood relationship with the central coast may have had a pivotal role in the development and rise to power of the Ica people during the subsequent LIP period.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Morrow, Juliet (Arkansas Archeological Survey), J. Christopher Gillam (Winthrop University) and Brandy Dacus[81] *Paleoindians of Arkansas: From the Mountains to the Mississippi of the Interior Southeast*

In the past two decades, advancing methodologies and the recovery of new cultural materials have expanded our knowledge of the earliest peopling of the Ozarks, Ouachita Mountains and Mississippi Valley of Arkansas. In the late 1990's, GIS analyses in the Mississippi Valley of northeastern Arkansas highlighted the significant association of early cultures to the lithic resources of the landscape and subsequent collaboration with PIDBA in the past decade has put this state-level record in continental context. Ongoing documentation of fluted-points and their geographic distributions continues to shed new light on these earliest cultures of the interior Southeast.

[120] *Discussant***Morrow, Sara (University of Notre Dame)**[296] *Consumption Practice and the Authenticity of "Irishness": Everyday Material Life on the Islands of Inishark and Inishbofin, Co. Galway, Ireland*

How were mass-produced consumer goods incorporated into everyday expressions of local and national identity in 19th and early 20th century Ireland? While archaeologists have explored the myriad ways that mass-produced goods circulated throughout the British Empire through networks of trade and exchange, less attention has been given to the way specifically British manufactured goods were incorporated into meaningful practices of material consumption within Irish communities. This project investigates how these industrially produced consumer products became woven into the social, religious, and cultural fabric of daily life in the Irish island communities of Inishark and Inishbofin from the late 18th century to the present day. Recent archaeological investigations by the Cultural Landscapes of the Irish Coast project on Inishark and Inishbofin, combined with the oral history of island residents, will further an understanding of the significant ways that mass-produced consumer goods were meaningfully incorporated into island life through the collection of delph (ceramics) on household dressers, and consumption of tobacco pipes in everyday life and during traditional Irish wakes.

Morton, Shawn (Northern Arizona University) and Meaghan Peuramaki-Brown (Athabasca University)[82] *Spatial Structure and Ancient Neighbourhoods: A Re-evaluation of Methods and Interpretations at Teotihuacan, Mexico*

In a 2012 article exploring the spatial structure of post-Tlamilolpa phase Teotihuacan, Mexico, we invoked both a materialist body of method-theory known as space syntax and an interactional theory of community development. Through this framework, we discussed community structure and systems of authority expressed by the architectural masses and spaces of the city. In this paper, the authors revisit this approach, with fresh eyes and in the context of our growing knowledge of ancient urbanism. How might we modify our interpretations in the face of additional data, complementary/contradictory interpretation, and critiques of the methods employed? Does this approach still hold intellectual merit?

Morton, Shawn [37] see Peuramaki-Brown, Meaghan

Moses, Sharon (Northern Arizona University)[62] *Discussant***Moses, Victoria (University of Arizona)**[297] *Meat Production and Animal Sacrifice during the Urbanization of Archaic Rome*

During the Archaic period (8th-6th cent. BCE), Rome underwent rapid urbanization with concomitant social changes. This shift from modest settlement to urban center affected how animals were raised, distributed, and consumed. Namely, large-scale animal sacrifice rituals within the city acted as a new mechanism for distributing meat to the masses, provided by centralized authorities. The increased scale of animal sacrifice in the nascent city would have created new meanings to these rites and led to a new demand for meat in public spaces. While transhumance and larger herds had been used for meat production in central Italy before the Archaic Period, urbanization would have shifted the supply chain towards a reliance on animals raised outside the city. This paper uses zooarchaeological data to explore the supply chain of meat production and distribution from outside of the city and peripheral zones, urban husbandry, and civic identity in early Rome.

Moss, Emanuel (CUNY Graduate Center) and Christopher H. Roosevelt (Koç University)[130] *Digital Technology, Digital Practices: Incorporating Digital Techniques into Archaeological Excavation and Interpretation*

Digital methods in archaeology have led to new ways of recording, analyzing, and presenting archaeological sites and materials, but these new methods are adopted within the context of previously existing practices of archaeological work. Some digital recording methods in excavation build upon and sometimes displace long-standing analog methods with proven results. Digital representations of cultural materials present novel interpretive affordances compared to analog representations that, while they suggest new possibilities for analysis and scholarly communication, also challenge traditional framings through which such materials have been understood. This paper discusses these challenges in the context of implementing a 'born-digital' site-recording methodology at Kaymakçı, a Middle and Late Bronze Age site in western Anatolia, focusing on the effects of new digital techniques on concepts central to archaeological practice such as accuracy and precision, diligence and orthopraxy, as well as implications for working with digital representations of cultural materials in the lab and beyond.

Moss, Jessica (Georgia State University)[330] *Photogrammetry Reconstructions of the Excavation Process: An Animated Georeferenced Approach*

Photogrammetry can be used to reconstruct the excavation process in a way that aids in both interpretation and education. By peeling back the layers of each excavation level, three-dimensional documentation of the excavation process reveals both the archaeological materials and their context at various stages of excavation. This interdisciplinary tool can also be georeferenced with GIS and used within 3D modeling programs to extend its visualization applications into virtual or augmented reality platforms. This project examines both the methods and applications of this technique using data collected during excavations within Vista Alegre, Mexico. Units are reconstructed at regular intervals within a digital environment, creating a highly detailed animation that can be navigated and examined. Once georeferenced within ArcGIS, these collections are also used within an ongoing project to digitally reconstruct various phases of Vista Alegre for a Virtual Reality environment. Additionally, this project includes a discussion the potential educational uses of both Virtual Reality visualizations of this data and the interpretive possibilities of their use.

Motuzaitė Matuzevičiūtė, Giedrė (Lithuanian Institute of History)**[336]** *Geographical Margins as Key to Understanding Crop Dispersal Mechanisms in Prehistory: Case Study for Kyrgyzstan*

More than 8000 years ago, a variety of crop species began to spread across Eurasia, reaching its edges approximately 4000 years later. The chain of mountains that stretches across Central Asia constituted a geographical obstacle that slowed down the dispersal process. Special high altitude adaptive strategies were required not only by humans, but also by plants due to changes in the length of the growing season, climatic conditions, UV intensity, among other factors. Therefore, the mountain regions acted as geographical filters that influenced which plant species and their varieties got dispersed to more distant regions of Eurasia. The territory of Kyrgyzstan (almost 90% of the territory lies above 1900 amsl) therefore constitutes a key area for the study of crop and animal adaptation strategies, as it is in this area that the filtering effect on plant and animal selection by communities would have been the most distinctive. The archaeobotanical material presented in this talk comes from high altitude sites in Kyrgyzstan. Some elements of crop adaptation observed in the research contribute towards explaining the pattern of crop dispersal across Eurasia.

Mountjoy, Joseph (Universidad de Guadalajara, México)**[192]** *Discussant***Moyes, Holley (University of California, Merced)****[136]** *The Space of Liminality: Between Ritual and Theater in Late Classic Ancient Maya Cave Rites*

Performance theory recognizes that the boundaries between ritual and theatrical performances are often quite blurred, allowing shared methods of analysis between the two. While many have argued for a theater-state among the ancient Maya, few have ventured beyond the large ceremonies conducted in great plazas to consider the more esoteric nature of public, semi-public, and private rites taking place in the natural landscape. Ancient Maya caves were used exclusively as ritual spaces, yet there has been little consideration of the performance characteristics of these sites. The ritual performances conducted in and around caves create a space for thinking about these venues as “theaters” with audiences, performers, backdrops, and lighting. In this paper we analyze architectural modifications to caves found in the Chiquibul Forest Reserve in Western Belize. We argue that architecture structured space and determined the parameters of its use, illustrating how some features channeled movement; some restricted space, while others focused attention. Our study sheds new light not only on the performance characteristics of ritual cave use but on the nature of the participants as well.

The First Baptist Church of Philadelphia was faced with something all churches confronted—the death of their parishioners. Their burying ground along with their church would evolve and change in both size and location over time. By mid-eighteenth century Lagrange Cemetery was in full use. Who occupied the First Baptist’s Lagrange Cemetery in early Philadelphia? Who were the notable and not so notable residents buried side by side? In exploring the history of over one hundred years of its operation beginning with the first burials on Arch Street to the believed removal of those interred to Mount Moriah, both pastor and parishioners are given their place in the cemeteries’ long history.

Mullin, John (Fort A.P. Hill, Virginia)**[281]** *Discussant***Mullins, Patrick (University of Pittsburgh)****[295]** *Frontier Landscapes in the Longue Durée: The Upper Moche Valley Chaupiyunga*

Physical landscapes shape, and are shaped by, human activity throughout prehistory, creating a palimpsest of anthropogenic and natural landscape features that archaeologists wrestle with to understand past human behavior. Located between the Andean highlands and the arid coastline, the Upper Moche Valley chaupiyunga no doubt would represent a geological and ecological frontier in the absence of human occupation. However, over two millennia of human activity are inscribed upon this landscape and make it an excellent case-study for understanding the construction of a frontier landscape over the longue durée. Is it inevitable that the region’s geological and ecological characteristics precluded its characterization as a demographic, cultural, and political frontier? At what points may the anthropogenic landscape depart from the natural in being identified as a “frontier”? What processes may affect such departures? These questions are addressed using GIS analyses of settlement patterns, landscape use, visibility, and movement applied to data collected during a full-coverage pedestrian survey of the Upper Moche Valley chaupiyunga by the author. Taking a diachronic approach to analyze two millennia of human occupation, this paper focuses on reconstructing the built landscape in order to test the effect of deeper landscape histories on subsequent occupations on the regional level.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Mundt, Jessica (VCP Alexandria) and Jasmine Heckman (VCP)**[326]** *The Veterans Curation Program: Unintended Public Archaeology*

The Veterans Curation Program was created with the mission to rehabilitate U.S. Army Corps of Engineers (USACE) archaeological collections while providing temporary employment and vocational training to veterans. In the nine years that the VCP has been in operation, it has evolved into a dynamic public archaeology effort that engages non-archaeologists in the field of archaeology on a daily basis. This paper explores the varied approaches to public archaeology within the Program, as well as the intended and unintended outcomes.

Munger, Tressa (Augustana University), Caitlyn Stellmach, Laura Peck (Augustana University), KC Carlson (Augustana University) and Lee Bement (Oklahoma University)**[223]** *The Butchering Patterns Present at the Bull Creek Camp: A Late Paleoindian Site in Oklahoma*

Bull Creek, located in the panhandle of Oklahoma, is a rare late Paleoindian camp on the Southern Plains. Two separate occupation levels apparent at the camp indicate two seasons of habitation. The lower camp, dominated by bison bone, is the focus of this analysis. Bone tools and distinct butcher marks provide evidence of butchering behavior 9,000 years ago on the Southern Plains of Oklahoma. This poster describes the findings of butchering processes at the site. Large sections of bison are apparent at the camp as well as articulated leg elements broken into tools. The evidence provided in this poster indicates that the kill site is likely not far away and that bone tools were frequently used during this occupation of the site.

Munkittrick, Jessica (Memorial University of Newfoundland) and Vaughan Grimes (Memorial University of Newfoundland)**[88]** *Exploring Childhood Health through Lead Trace Element and Isotope Analyses: A Case Study of Historic Populations in Newfoundland, Canada*

Lead was ubiquitous throughout the cultural environments of the Atlantic World during the 18th and 19th centuries and can be toxic to humans, particularly children. There is a long history of examining human lead exposure using trace element and isotope data in archaeological remains, but most studies have sampled bone tissue, which is prone to diagenetic alteration. More recently, researchers are sampling tooth enamel, which is more likely to retain a biogenic record of lead exposure. Since teeth form during childhood and lead exposure reflects individuals' interactions with their physical and cultural environments, this tissue presents an intriguing means to examine childhood health. However, archaeological research often overlooks children as meaningful cultural actors. The consideration of childhood social theory can help to illuminate methodological and theoretical opportunities to produce better lead trace element and isotope data that can be more clearly incorporated into understanding the Child's World. By examining the lead trace element and isotope values of tooth enamel produced using ICP-MS and MC-ICP-MS from individuals of historic Newfoundland populations, this paper will outline these considerations through a case study of childhood lead exposure in 18th and early 19th century Newfoundland.

Munoz, Cynthia [153] see Mauldin, Raymond

Munson, Jessica (Lycoming College), Jonathan Scholnick (Lycoming College) and Lorena Paiz Aragon (Altar de Sacrificios Archaeological Project)**[302]** *Quality of Life Changes in an Ancient Maya Community: Longitudinal Perspectives from Altar de Sacrificios, Guatemala*

Inequality is a prominent and persistent feature of all large-scale human societies that has significant impacts on everyday life. Variation in material wealth and social capital as well as differential access to specialized knowledge and other resources directly impacts household quality of life (QOL) within ancient and contemporary communities. For the ancient Maya, the establishment of political institutions centered on divine rulership significantly contributed to QOL changes during the Preclassic and Classic periods (ca. 950 BCE—950 CE). However, tracking these variations and measuring their effects pose specific challenges for archaeology. Well-documented settlements with an extensive and long-term occupation like Altar de Sacrificios provide important contexts to investigate the rapid transformations associated with the emergence of institutionalized inequality and concomitant changes in QOL across diverse domestic settings. This poster presents the results of ongoing analysis of ritual deposits excavated by the Altar de Sacrificios Archaeological Project (2016-present) and previous investigations conducted by Harvard University (1958–1963) to gain a better understanding of the wealth variations and distribution of specialized knowledge within this ancient Maya community over a span of about 2000 years.

Munson, Jessica [101] see Mejía Ramón, Andrés

Muntz, Alice (Southern Illinois University Carbondale)**[81]** *Understanding Manifestations of Public Ritual in Late Mississippian Pottery: A Comparison of Millstone Bluff and Dillow's Ridge Ceramic Assemblages*

This research entails the thorough analysis and comparison of two ceramic assemblages to understand whether and how ritual manifests in pottery of the Late Mississippian Southeast. The study focuses on ritual phenomena exhibited at two Late Mississippian Period (ca. late 1200s A.D. to A.D. 1500) settlements in southern Illinois, the Millstone Bluff site in Pope County (11Pp3) and the Dillow's Ridge site in Union County (11U635). Millstone Bluff has been interpreted as a site of public ritual and unusual symbolic importance evidenced by its general location and topography, spatial organization, and distinctive rock art. Though Dillow's Ridge was the locale for an inordinate level of chert tool production, in other ways the site is understood to be typical of Mississippian villages for this region and time. The sites serve, respectively, as proxies for high and low levels of public ritual phenomena. As a case study of the Late Mississippian cultures of the Ohio River Valley, this comparison of the Millstone Bluff and Dillow's Ridge sites provides an opportunity to evaluate the efficacy of current ceramic analysis methods for identifying ritual and understanding the social motivators that underlie ritualized activity.

Murakami, Tatsuya (Tulane University)**[262]** *Changing Urban Networks in Formative Central Mexico: A View from Tlalancaleca, Puebla*

It is likely that Formative urban centers and their interactions with one another provided cultural and historical settings for the creation of Central Mexican urban traditions during later periods. Yet their urbanization process remains poorly understood. Our research over the last six field seasons indicates that some residential groups were settled at Tlalancaleca towards 800 BC and the settlement was urbanized with a significant population growth during the later Middle Formative period (ca. 650–500 BC); the city experienced large-scale urban transformations during the Late Formative (ca. 500–100 BC) and a subsequent and final urban expansion during the Terminal Formative (ca. 100 BC–AD 250). Tlalancaleca's long occupational history overlaps with that of Chalcatzingo as well as Teotihuacan and, thus, provides a unique opportunity to address long-term social transformations during the Formative period. Based on preliminary results of our research at Tlalancaleca, we will reconsider the trajectory of urban transformations in Central Mexico over 1000 years from the Middle Formative to the Terminal Formative/Early Classic periods and discuss its implications for understanding parallel and divergent trajectories of social transformation in later Formative Mesoamerica.

[190] *A Case Study in the Use of 3D Modeling for Hypothesis Generation and General Archaeological Illustration*

Three-dimensional modeling has become increasingly common within the field of archaeology as relevant software has become more accessible and digital media more prevalent. Despite this increase in use, the ultimate utility of the method is often debated, even by its practitioners. This poster explores the practical applications of 3D modeling along two avenues: as a process for developing hypotheses and expectations during the excavation of architectural contexts, and as a tool for use alongside conventional archaeological illustration. The excavation of a Pueblo IV field house, commenced in 2017 by the University of New Mexico field school, is used as a case study. The process of building a 3D model based upon partial excavation and comparative research is described, and the outcomes of the study in terms of enhancing learning and hypothesis construction are reviewed. Presentation of resulting models produced in the digital software program Blender are then juxtaposed with traditional archaeological illustration and the benefits and drawbacks of employing each method for this purpose are discussed.

[100] *Colonial Demography and Bioarchaeology*

A growing body of bioarchaeological research into the biocultural effects of Spanish colonialism on native Andean communities shows that traditional and popular narratives emphasizing the roles of epidemic disease and Spanish military superiority in the conquest of the Inca Empire are oversimplified. In this poster, I synthesize recent bioarchaeological research from different sites in Peru that has interrogated the intricacies and etiologies of native mortality and depopulation, differential fertility, migration, and population recovery, as well as successful native adaptation and mortuary practices. New scholarship has yielded some compelling results about the entangled lives of Andeans, Spaniards, and Africans under colonial rule. These new works confirm the truism that bioarchaeological interpretation is much richer when the bioarchaeological lines of evidence are complemented and accompanied by other lines of archaeological data. The florescence of research in historical archaeology in the Central Andes holds promise for future bioarchaeological research and in this poster I also detail some directions and avenues for future research

[303] *Landscapes of Acquisition and Mobility: Sourcing Raw Lithic Materials and Their Distribution in Central Cyprus*

Making use of several long-term survey projects in central Cyprus, the connection between chert sources, find spots and sites are analyzed using chemical and spatial analyses to examine the relationship between mobility and community structure. The Neutron Activation Analysis (NAA) of some 150 samples shows that distinct types of chert were preferred, primarily Lefkara transluents. Spatial analyses investigate the associations between particular chert outcrops, small lithic scatters and larger settlements based on this chemical analysis. Results demonstrate clear links between chert sources, lithic scatters and sites highlighting how early settlers used resources as they settled new landscapes. We see that people were willing to travel greater distances to access desired cherts. It is likely that other activities were embedded in these journeys, which would provide not only access to preferred cherts but to a hinterland rich in animals, edible plants, fuel and water. Based on the hierarchy of site sizes, ranging from isolated finds, small scatters and up to sites of several hectares, we may also be seeing a range of site use, from casual discard to seasonal resource exploitation and longer term habitation.

Murphy, Timothy (Vandenberg Air Force Base—Contractor)

[38] *A GIS Analysis of Ancient Human Trails, Human Behavioral Ecology, and Agency in the Mojave and Colorado Desert*

Desert environments pose challenging conditions to human travel in the form of exposure to intense weather and access to important water sources. Environmental constraints of the desert can explain people's decisions to consider energy-efficient modes of travel through the framework of Human Behavioral Ecology. Culture, however, does not always follow the model of Human Behavioral Ecology, even in environments posing challenges that require efficient ways of living. Cultural knowledge, beliefs, and values are shared through generations, transforming an environment from constraining to familiar. By exploring the relationship between environmental constraints and route selections of ancient humans, we can support Human Behavioral Ecology as a baseline explanation for ancient trails in the desert. Although people do not always follow the most energy efficient routes, shifting their focus from efficiency to a different value. Perhaps we can further understand how people selected routes within a certain environment by measuring and comparing the most energy efficient routes on a cultural landscape to actual trails on the same cultural landscape. GIS may help us see patterns of past human decisions to follow efficient routes, as understood through Human Behavioral Ecology, and routes that deviate from the norm of efficiency, potentially indicating Agency.

[240] *GIS Analysis of Monumental Structures at the Late Moche Site of Galindo*

The site of Galindo was a major center of the Southern Moche Region during the Late Moche Period (600–900 A.D.) and represents an important temporal transition between Moche-style polities and the Chimú Empire in the Moche Valley. During Galindo's occupation, monumental construction shifted from adobe mound complexes to walled administrative centers known as cercaduras, suggesting a possibly larger socio-political change in how political power was being negotiated by elites. Working off of the concept of "architecture as artifact", this project aims to examine architectural investment in monumentality during the last years of the waning Moche political tradition. To do this, a 3D map was created using aerial photographs taken with a quadcopter drone and photogrammetry software. The various structures at Galindo were then identified and analyzed using GIS software to attain the necessary data on volume and form to create informed site reconstructions. Site reconstructions were then utilized to understand changes in labor investment, elite access to labor pools, and the form of monumentality through the site's occupation.

[89] *Using Surface Roughness to Identify Heat Treatment in Lithic Technology*

The heat treatment of stone to enhance flaking attributes was an important advancement in the adaptive toolkit of early humans. The earliest evidence for this is the heat treatment of silcrete 164 ka at the Middle Stone Age site Pinnacle Point 13B in South Africa. Heating stone prior to knapping alters the physical and chemical composition of the stone, and it has long been recognized that flaked heat-treated stone has a glossier surface. We expect this glossiness to result from a smoother flaked surface. Thus, we investigated whether surface roughness, as measured by a 3D microscope, can be used as a proxy to identify the presence of heat treatment in the archaeological record. The results of our unpublished pilot study suggested roughness parameters differ significantly between untreated and treated silcrete. In the present study, we record values for multiple surface texture parameters on a sample of experimentally created stone tools from paired heat-treated and untreated silcrete nodules. A Bayesian probability model, trained on the experimental sample, was then used to evaluate the probability individual artifacts have undergone heat treatment. This research provides a novel, probabilistic, cheap, and non-invasive technique for identifying heat treatment.

Murray, Matthew (University of Mississippi)

[196] *"Our Past is Not the Other"—Anthropological Archaeology and Academic Peripheries in Central Europe*

As an archaeologist who practices and teaches holistic anthropology and has long been fascinated by the rich prehistory of Central Europe, I am shy about sharing my anthropological tendencies with German colleagues. When I do, I am often greeted with surprise, confusion, and a polite suggestion that I should be in Papua New Guinea or other places where German anthropologists engage with people who are perceived as different from contemporary Europeans. In Central Europe, archaeology is traditionally tied to history and the people of its past are often assumed to be just like "us." Interpretive frameworks to explain the Iron Age, have long been derived from European medieval history, such as the concept of the Fürstentum ("princely seat") of the early Iron Age, or from the European Classics, such as the notion that ubiquitous late Iron Age rectilinear enclosures (Viereckschanzen) are functionally similar to Greek temples. While a new generation of German scholars embraces critical history and social theory, the idea that the later European past is a familiar place is persistent. As an outsider, both geographically and disciplinarily, I have challenged this perspective and sometimes received an illuminating rebuke from the European archaeology establishment.

[80] *Livelihoods and Opportunities: Household, Land Use and Landscape Change at Tikal*

Sometimes described as a mosaic, regional land use and landscape in the Maya lowlands offer a unique opportunity to investigate the spatial and temporal dimensions and the socio-ecological dynamics of a variety of cultural systems, settlement patterns, and the environment. Unfortunately, the majority of urban theory applied to the lowlands focuses exclusively on urban authority and power for the provisioning of resources. Such approaches offer useful discussion and debate about the scale and intensity of these systems, but provide little comparative anthropological information about the complex interactions among households, landscape, and ecology. Building on early regional archaeological science at Tikal, this paper describes and analyzes regional spatial and temporal variation of the distribution of households, land use, and resources in the region. Particular attention is paid to recent regional soil surveys as compared to what is known about settlement patterns. Emphasizing livelihoods and opportunities, the key purpose of the paper is to shift discussions in the Maya lowlands from generalized theory of urbanization, including obsolete urban and rural dichotomies, to household provisioning of food, resources, and ecosystem services. In this context, landscape and planning are spatially heterogeneous household centered responses best described as a lowland Maya mosaic.

Musser-Lopez, Ruth (River AHA (Archaeological Heritage Association))

[73] *Virgin Puebloan and Fremont Rock Art at Petroglyph Corral*

Though routine interaction may not have been the case, the Fremont were a part of the iconic world of the Virgin (Anasazi) Puebloan people who occupied southeastern Nevada north of Las Vegas in Evergreen Flats, 75 miles northwest the Lower Colorado River's north end bend. Within that region is Petroglyph Corral visually demonstrating Puebloan people at a Fremont fringe area where the two cultures may have competed, collided or even collapsed into one another and the more recent Numic tribes. Clearly a favored place that inspired recurrent cycles of symbolic affirmation, the contrasting motifs on vertical panels and porphyry slabs at Petroglyph Corral indicate definite breaks in continuity of heritage and world view over the centuries as rock art accumulated there. Along with the research of excavated archaeological deposits below the panels as a part of the Evergreen Flat Project (Horne & Musser-Lopez 2017), the repatinated art, buried art, faded art, layers of art, obfuscated art and replenished art tell a story of time and change spanning 3000 years from present day Numic speakers, back to the Puebloan and Fremont, with rare traces of Hohokam and Mojavean, the archaic people who came before.

[39] *Porte des Morts Lighthouse Ruins Excavation: The Study of a Mid-19th Century Lighthouse Site on the Great Lakes*

A historic maritime ruins site located on Plum Island off the tip of Wisconsin's Door Peninsula was acquired by the U.S. Fish and Wildlife Service in 2007. The Porte des Morts Lighthouse (47DR497) operated briefly from 1849 to 1858 until replaced by a more substantial lighthouse on nearby Pilot Island. In partnership with Hamline University, excavations took place between 2013–2015 to uncover evidence as to both the architecture of the building and domestic life on the maritime frontier. Spotty historical evidence suggested that the building was not constructed to contract specifications and island life was challenging for Lighthouse keeper William Riggins and his wife Phebe and their growing family. Excavations uncovered intriguing evidence of desperate attempts by the family to stabilize crumbling walls and keep the light beacon functioning. In addition, the recovery of a robust assemblage of nearly 16,000 artifacts and faunal remains paints a picture of their daily lives from teaching writing skills to their children, feeding the family dog, and revealing Phebe's love of "Romantic Scenery" dishes.

[105] *Does Increasing Social Complexity Buffer Energy Consumption from the Effects of High Frequency Climate Variation? A Western European Case Study*

Humans, like any other organism, must continuously adapt to or modify their surrounding environment to maximize their fitness. One of the main sources of environmental variation that humans must cope with is climate variation. Adjustment to climate variation may include increasing investments in infrastructure (social, technological, cognitive), which acts as a buffer, filtering out the effects of higher frequency climate variation on the ability of individuals and populations to consume energy, and thus maximize an individual's fitness or the mean fitness of a population. As investments in infrastructure increase, social complexity increases, and higher frequency climate signals (such as annual temperature or precipitation) should become increasingly more out of phase with annual energy consumption (representing a social output). Using energy consumption levels and climate data from Western Europe over the last 400 years, we evaluate this idea that increases in infrastructure increasingly buffered the energy consumption dynamics of populations from high frequency climate variations. The results of our analysis are important for developing a general theory of human responses to climate change that can be applied to archaeological case studies.

[338] *Gender-Based Violence and Discrimination in Middle Eastern and North African Fieldwork*

In 2014, inspired by the work on gender-based violence in field settings done by anthropologists Clancy, Nelson, Rutherford, and Hinde, I began investigating field safety for archaeologists working in the Middle East and North Africa, the region in which I work. At that time, I was a trustee of the American Schools of Oriental Research—and I chair its Initiative on the Status of Women. I began by quantifying problems (Survey on Field Safety: Middle East, North Africa, and The Mediterranean Basin: 2014, 2015), looking at gender-based violence and discrimination in field assignments and in post-field research and publication.

My goals are to: determine factors contributing to safe/unsafe fieldwork environments; determine best practices and effective ways to implement them; develop standards, policies, protocols and trainings to educate excavators about relevant ethics and laws for field and research projects; and, under ASOR's auspices, provide all excavators with much-needed information. At The University of Arizona, I work with the offices of Title IX, Global Initiatives (Study Abroad), and the Dean of Students, and I am involved with the new Center for the Study and Prevention of Gender-Based Violence. This presentation discusses the various components of this project.

[13] *Modeling the Early Settlement of Yap, Western Caroline Islands*

In recent decades, increased research on the early human settlement of islands in western Micronesia (northwest tropical Pacific) has resulted in a relatively clear picture of the Palau and the Mariana Islands being settled between ca. 3200–2800 years cal BP. Despite an increased understanding of when the two major archipelagos were settled, human arrival in Yap, a group of four small islands situated between the two other islands groups, remains unclear. New radiocarbon dates from the southern site of Pemrang suggest settlement as early as ca. 2400 cal BP, yet paleoenvironmental and linguistic data suggest settlement could be as early as ca. 3200–3000 cal BP. Clarifying these conflicting lines of evidence is critical to our understanding of human settlement in the region, yet is hampered by a lack of paleoenvironmental and archaeological research. This paper presents the results of a systematic auger survey at Pemrang and uses the location of shell and Calcareous Sand Tempered pottery to model the extent of early settlement in southern Yap.

[35] *Establishing a Multimillennial Dendrochronological Sequence in the Atlantic Southeast, USA*

This paper discusses advances in the development of a multi-millennial ring-width chronology based on bald cypress (*Taxodium distichum*) from the mouth of the Altamaha River in Georgia. New insights into the environmental history of coastal Georgia are discussed, including the archaeological implications of major climatic and ecological events visible in the ancient cypress rings. Finally, we focus on environmental conditions before, during, and after the transition from the Late Archaic (ca. 4500–3100 B.P.) to the Early Woodland (ca. 3100–2400 B.P.), comparing the timelines of change indicated by tree-ring proxies to events occurring in the region and around the world in this period of global cultural and climatic upheaval.

[64] *Archaeological Investigations in El Paraíso. A Late Pre-ceramic Architectural Complex in Lima—Peru*

El Paraíso architectonic complex is located in the lower section of the Chillón River Valley, less than 2 km from the Pacific Ocean, in Lima, the capital city of Peru. It is composed by 14 structures, or huacas, distributed in an area of 47 hectares, in a rural place named Chuquitanta. The site is recognized as one of the earliest expressions of monumental architecture and social complexity in Peru since the works of Frédéric Engel in the 1960's and Jeffrey Quilter in the 1980's. Since 2015, the Peruvian Ministry of Culture is developing a project of investigation, conservation and restoration of the site. This presentation explains the results of the first two years of the project. So far, we developed excavations in architectonics I, III, IV, VI, and IX, defining the constructive phases of those buildings, and recovering evidences of an economy based on agriculture production complemented with the exploitations for marine and riverine resources. Also, offerings chambers were discovered with especial artifacts like slings, lithic clubs, digging sticks, a cactus, and the burial of a young women. Other burials of the Late Intermediate and Late Horizon Periods are giving important information about the Colli occupation of the site.

[328] *Soundscape and Place: Acoustic Archaeology in the Mountains of the Middle Atlantic*

As permanent landmarks, waterfalls and associated plunge pools are documented among traditional peoples as liminal and sacred spaces. A review of ethnographic and archaeological literature identifies these features as sources of life and transition, requiring proper preparation in advance of approach. The symbolic and experiential character of waterfalls may be in evidence in the Virginia Blue Ridge, where a small number of Middle and Late Woodland sites near named waterfalls are outside the topographic parameters of modeled site locations. Found on north-facing, steep slopes, these small ceramic-bearing sites have been documented in the several well-known falls settings in the Blue Ridge Mountains. Decibel readings and

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

sound mapping with ArcGIS demonstrate the correspondence of archaeological site locations to areas where waterfall sound is most highly magnified by stream hollow walls. An example of Feld's 'acoustemology,' which takes into consideration sensory experience and memory as central to place identity, these Blue Ridge sites may represent locations where Native peoples paused to prepare themselves prior to approaching spaces requiring reverence.

Nash, Donna (UNCG)

[82] *Cerro Mejía: A Wari Community Divided?*

The Wari-affiliated community on Cerro Mejía is divided by large walls that cut the slopes into vertical strips. These segments of the site may represent divisions of the settlement that the occupants recognized, agreed with, and maintained or these groupings may have been imposed by Wari officials. In this paper, I describe the features of Cerro Mejía and consider this important question. In light of overt differences between houses with regards to form and construction techniques I suggest that barrio walls divided colonists from different regions, who arrived sometime in the seventh or eighth century CE. Also, despite several generations of co-occupation at Cerro Mejía it appears some elements of quotidian life were maintained as distinctive between these groups when the site was abandoned and smaller communities were founded in the early Late Intermediate Period (ca. 1250 CE).

[134] *Analysis of Culturally Derived Speleothem by INAA: An Analytic Approach to Sourcing*

Recent investigations in various surface and underground cave sites indicate the existence of extensive political, economic, religious and military exchanges between polities in the Maya lowlands of Belize.

The occurrence of "foreign" materials at surface and cave sites have become an increasingly well-documented phenomenon (Brady et al. 1997) and are indicative of transport of speleothems during ancient Maya cave visitations. This phenomenon has raised several questions such as the spatial and temporal extent of these interactions, practices, and specifically the relationship between Maya polities and proximal or distant caves.

Geochemical analysis of samples by Instrumental Neutron Activation Analyses (INAA) is a very common and reliable practice. In this study we analyzed (71) samples comprised of various types of speleothems (Stalactites, stalagmites, flowstones, cave pearls) collected in various locales in Belize (Macal, Barton Creek, Pine Ridge, Roaring Creek, Cave's Branch and Sibun Valley). Our samples were from two separate expeditions, the Belize Valley Speleothem Project and provided by Dr. Holley Moyes (U.C. Merced), and Xibun Archaeological Research Project provided by Dr. Polly A Peterson. Our results elucidates the use of INAA as a viable method of sourcing lithic materials, differentiating samples within the same cave and between different caves.

[292] *Teaching Scientific Anthropology in the Age of Trump: Towards a Pedagogy of Science Literacy and Advocacy*

The year 2017 was one of extraordinary science activism. Scientists took to the streets as the overwhelming empirical evidence demonstrating humanity's role in ushering in global warming continued to be ignored. Politicization of climate change, and science itself, has fostered a dangerous rejection of scientific knowledge prompting numerous conspiracy theories involving everything from so-called flat-earthers to anti-vaxxers, intelligent design proponents and climate deniers. Such perilous and unfounded claims thrive due to repeated efforts from faith-based organizations paired with the far right to frame science as leftist elitism at best and incompatible with faith at worst. Insufficient emphasis on effective science pedagogy darkens this picture. Within the curricular confines of anthropology courses, pedagogical strategies aimed at defining science while illustrating its uses within the discipline is critical. Learning goals aimed at 1) understanding science as process 2) critical thinking, and 3) competence in science literacy prepare undergraduates for engaging effectively in discussions about climate change, the Anthropocene, and its implications. In our age of unprecedented information access, an informed community of science advocates is a major defense against the myriad unfounded arguments, assertions of fake news, and spin.

[310] *Domesticating the Mosaic: Stable Isotope Approaches to Agroecologies in South Asia*

The origin of agriculture is a long-standing and pivotal point of archaeological research. The focus, however, has predominantly been on the earliest instances of crop domestication, whereas less is known about the nature of early farming. South Asia with its mosaic of environments and early farming strategies demonstrates the need for nuanced attention to aspects of early agro-ecologies such as manuring, water management strategies, and animal husbandry. Stable isotope analysis of botanical, faunal, and human remains has increasingly emerged as a powerful tool for reconstructing local farming practices, including crop growing conditions, herding and foddering, and dietary reliance on different types of food. Here, I discuss how these methodologies are aiding in the development of a more detailed understanding of early agricultural strategies in the diverse eco-geographical zones of the Indian subcontinent. I argue that these datasets allow us to link subsistence observations to changes and differentiation in social organisation and to anthropogenic landscape use and perception.

Neeley, Michael (Montana State University) and Craig Lee (Metcalf Archaeological Consultants and Montana Sta)**[155]** *Assessing Cortex at the Beaucoup Site (24PH188/189) in Northern Montana*

Although archaeological analyses of lithic assemblages generate large quantities of data, it can be difficult to equate the observations with past behaviors. One variable state regularly recorded is that of cortex. The presence/absence of cortex is often linked to reduction intensity with variable cortical frequencies linked to early or late stage reduction and potentially reflective of residential mobility. However, we lack reliable markers or values to support our interpretations. Recently, Harold Dibble (and others) have proposed a method for evaluating assemblage cortex by comparing observed and expected frequencies. These values serve as a baseline for interpreting and understanding assemblage variability along the lines of forager mobility. This paper applies the method developed by Dibble and others to the lithic assemblage from the Beaucoup site (24PH188/189) in northern Montana, a Late Prehistoric site with spatially distinct kill, processing, and residential areas. The lithic raw materials found in the assemblage (particularly quartzites) occur on-site and, as a result raw material size, shape, and origins are known. Our preliminary examination of cortex patterns indicates spatial differences between the areas of the site which may reflect variations in residential mobility.

Neff, Linda, Ted Neff (Coconino National Forest), Peter Pilles (Coconino National Forest) and Ronald Krug (Verde Valley Chapter of the Arizona Archaeological)**[48]** *A Settlement Pattern Analysis of Yavapai and Apache Archaeological Sites in the Verde Valley Area, Central Arizona*

Ethnohistoric accounts, historic records, and the archaeological record indicate the Yavapai and Northern Tonto Apache lived a mobile lifestyle during Protohistoric time (approximately A.D. 1300—1850) across the diverse environment of the Verde Valley area of Central Arizona, just south of the Colorado Plateau. Due to their subtle, portable, perishable, expedient, and reused material traces across the landscape, archaeologists struggle to merely identify protohistoric sites much less distinguish between the Yavapai and Apache with their partially overlapping territories and similar lifestyles. Yet limited site recordation and excavation by archaeologists with a keen eye have revealed that diagnostic archaeological signatures such as rock clearings, rock rings, modified Puebloan masonry, roasting pits, rockshelters, rock art, utilitarian pottery wares, projectile points, and ground stone are present that indicate continuous occupation in the Verde Valley area during the Protohistoric period. Our poster presents the results of a settlement pattern analysis focused on Verde Valley area terrain within the Red Rock Ranger District of the Coconino National Forest. Using the Forest's archaeological databases and other data sources, we explore the Yavapai and Apache settlement pattern in relation to major drainages, environmental zones, Puebloan archaeological sites, and trails.

Neff, Hector (California State University-Long Beach)**[176]** *Cash Potting in Soconusco: The Case of Tohil Plumbate*

Tohil Plumbate, defined by distinctive technology and distinctive decorative style, is found throughout Mesoamerica, with peak frequencies in the central and western highlands of Guatemala and strong representation at Terminal Classic Maya centers like Chichen Itza. INAA-based source determination and recent fieldwork link the technology to the Pacific coastal zone of eastern Soconusco, near the Chiapas-Guatemala border. Curiously, however, key stylistic features, especially effigies and fancy, curvilinear incising, are almost absent from the production zone. The closest places where these stylistic elements appear in any frequency is at the piedmont centers of Izapa and Takalik Abaj and at Tajumulco, at an elevation of over 2500 meters in the western highlands of Guatemala. At these and other western-highland sites, Tohil Plumbate is found most commonly as whole vessels in burials and other offerings. These archaeological patterns suggest that fancy Tohil-style vessels were produced for consumption who resided outside the production region, hence it is an example of "cash potting" analogous to production of bananas, coffee, and other cash crops for export markets today.

Neill, Oscar (Arqueólogo)**[299]** *Entre Mesoamérica y el Área Intermedia, Patrón de Asentamiento Arqueológico en la Costa Nororiental de Honduras*

La zona nororiental de Honduras en la época prehispánica, y su interacción con Mesoamérica al oeste, ha sido poco abordada. El patrón de asentamiento regional así como interno de cada sitio es igual poco conocido y muchas veces confundido con el área vecina al este. Los reconocimientos de superficie en esta década nos han brindado resultados preliminares sobre el patrón de asentamiento regional y de sitio de la costa nororiental, concretamente en la Cuenca del Río Cangrejal, el Bajo Aguan en el Valle del mismo nombre, y la llanura costera entre Tela y Trujillo. Esto nos brinda una aproximación concreta al tipo de patrón de asentamiento en esta zona, así como el registro y mapeo de los sitios y la clasificación de estos como medio comparativo con los sitios Mesoamericanos y los del Área Intermedia, siendo el primer paso la identificación de posibles patrones culturales e interacción entre áreas culturales.

Neiman, Fraser (Monticello), Lindsay Bloch (Florida Museum of Natural History, UF), Jillian Galle (Digital Archaeological Archive of Comparative Slav) and Jeffrey R. Ferguson (University of Missouri Research Reactor)**[51]** *Developing Reproducible Methods for Defining and Evaluating Ceramic Compositional Groups Derived from NAA and LA-ICP-MS*

The Digital Archaeological Archive of Comparative Slavery (DAACS), in collaboration with MURR and UNC Research Laboratories of Archaeology, has analyzed the elemental composition of nearly 400 coarse earthenware sherds from eighteenth and early nineteenth century plantation contexts from Jamaica. All of the sherds were analyzed using Neutron Activation Analysis (NAA), while nearly forty percent of these same sherds were analyzed via laser ablation-inductively coupled plasma-mass spectrometry (LA-ICP-MS). We develop a transparent workflow in R for identifying trial compositional groups and then evaluating them. We apply this workflow to elemental datasets generated by the two methods and compare the results, highlighting differences in the number of groups and relationships among sherd assignments to those groups. Finally, we assess the agreement among methods for evaluating our ideas about ceramic and manufacturing networks in early Jamaica.

Neiman, Fraser [51] see Galle, Jillian

Neitzel, Jill (University of Delaware)**[325]** *Color by Design on Hohokam Pottery*

This paper investigates whether hatched designs on Hohokam red-on-buff ceramics symbolized colors other than the red that was used to paint them. This idea is an extension of previous research done on Ancestral Pueblo and Mogollon black-on-white pottery. J.J. Brody initiated these investigations with his suggestion that hachure on Chaco ceramics from northwest New Mexico represented the color blue-green. Stephen Plog subsequently confirmed this hypothesis by comparing the colors and designs on other kinds of Chaco artifacts. More recently, Will Russell and colleagues applied Plog's analytical approach to Mimbres pottery from southwest New Mexico with somewhat different results. While they too found that hatched designs symbolized color, the color in this case was yellow rather than blue-green. Extending this research to the Hohokam may be severely constrained by the poor preservation of painted non-ceramic artifacts, but the results could provide new insights into cosmology, regional interaction, and cultural continuity throughout the late prehistoric Southwest.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Neller, Angela (Wanapum Heritage Center, Grant County PUD) and Lourdes Henebry-DeLeon (Central Washington University)**[253]** *The Best Defense Is a Good Offense: Culturally Affiliating the Ancient One by Following the Law*

The 20 year journey to repatriation of the Ancient One was long, arduous, frustrating, eye opening, and an education in the NAGPRA law. Over the years we have discovered how poorly understood the law can be. In the case of the Ancient One, the ownership or control of his remains falls under Section 3 of NAGPRA for inadvertent discoveries on federal lands after 1990. An overview of the evidentiary standard applicable to cultural affiliation determinations under NAGPRA will be presented. All available, population specific data for the Columbia Plateau was used. Scientific certainty is not required but rather a preponderance of the evidence standard, or belief that the existence of a cultural affiliation is more probable than its nonexistence. The claimant tribes followed the requirements set forth in the NAGPRA law and regulations to establish a relationship of shared group identity that can be reasonably traced between the Ancient One and themselves.

Nelson, Erin (University of South Alabama)**[122]** *Ash Deposition and Community Building in the Mississippian World: A Case Study from the Yazoo Basin*

Ethnographic sources indicate that fire and its alternate forms—smoke and ash—are powerfully symbolic substances for many historic period southeastern Indian groups. The remains of fire are frequently deposited in ways that amplify its power, or alternatively, attempt to neutralize it. This paper examines ash deposition at Parchman Place, a late Mississippian period (AD 1300–1541) site located in the northern Yazoo Basin. Here, and elsewhere in the Southeast, Mississippian people incorporated ash and other substances with cultural significance into earthworks of differing scales and types. Drawing on ethnohistoric and ethnographic accounts regarding the importance of fire and the disposal of its remains, I argue that people called upon the various powers of fire by depositing ash in specific ways and at key transitional moments. In doing so, Mississippian people attempted to negotiate differing views regarding leadership, relations among community members, and the importance of maintaining their place within the Mississippian cosmos.

Nelson, Matt**[334]** *Comparing Two Archaeological Geographic Information Systems (GIS) Predictive Models: The Greater Yellowstone Ecosystem versus the Pinelands, New Jersey*

This paper compares two new predictive models of prehistoric archaeological site locations to better understand modelling successes and complications. For my recent M.A. thesis project, I created one model for Yellowstone National Park to predict Paleoindian site locations within the Greater Yellowstone Ecosystem of the northwestern Great Plains and Rocky Mountains. I created the second model for the Pinelands region of central New Jersey for the United States Air National Guard, Warren Grove Gunnery Range. Both regions—Yellowstone and the Pinelands—have enough previous archaeological data to propose a Geographic Information Systems (GIS) predictive model of prehistoric site locations. While construction of the models varied for a variety of reasons, I used generally similar modelling methodologies for both. However, these two models were developed from very dissimilar site locational data and from completely different regional landscapes. On one hand, the Yellowstone model was developed specifically for Paleoindian archaeological site locations over a large and diverse mixture of landscapes in the Great Plains and Rockies. In contrast, the Warren Grove Pinelands model was developed using a relatively low number of sites, by comparison, within a fairly homogenous landscape.

Nelson, Peter (Assistant Professor, American Indian Studies, San Diego State University)**[272]** *Indigenous Refusals of Settler Territoriality: A Case from the Tolay Valley in Central California*

Spanish, Mexican and American waves of colonialism in Central California changed the lives of California Indian peoples in very drastic ways. California Indians were removed from their homes, forced to perform labor, and were moved into poor living conditions that contributed to declines in health and the loss of many California Indian lives. The physical removal of California Indians from their homes was also an attempt by Spanish missionaries and soldiers to re-imagine the indigenous world. Under Mexican rule, California Indians were transferred to ranchos to perform labor in similarly poor conditions. And during the early years of California statehood in the 1860s, so-called “vagrant” laws enabled white settlers to enslave California Indians who were found “idle” on their lands. Despite these hardships necessitating great change in traditional lifeways, California Indians remained immersed in and connected to a broader Indigenous world in which colonial places and institutions were only one part. That is, California Indians refused to wholly accept settler boundaries, ownership, and ways of using traditional lands by trespassing on settler-designated private property to hold ceremonies and collect traditional resources. A case from the Tolay Valley in Southern Sonoma County, California, during the nineteenth century will be presented.

[272] *Chair***Nelson, Ricky, Valda Black (Washington State University) and Danielle Kurin (University of California Santa Barbara)****[270]** *A Traditional Approach to Analyzing Stunted Femoral Growth in Peruvian Highlands*

Minimal research has been done on observing whether there have been incidences of stunted growth in populations, in times of environmental stress and social turmoil. One such example are the populations found during the Late Intermediate Period (~AD 1000–1400, LIP) in the South-Central Peruvian highlands. Utilizing Buikstra and Ubelaker’s Standards, nine measurements were taken on the femora of 37 individuals (N=37) from the sites of Sonhuayo, Masumachay, and Mina Cachihuancaray in the Andahuaylas region of the South-Central Peruvian highlands during the LIP. Measurements were used to calculate individual, population heights, and sex to compare within and between population variation and the possibility of stunted growth. The results showed an average of maximum length of 39.46cm within the population. The 7males (N=7) have an average maximum length of 41.33cm, with a minimum and maximum of 38.2cm and 44cm. The 30 females(N=30) have an average maximum length of 38.99cm, with a minimum and maximum of 33.2cm and 43cm Stunted individuals were determined by finding those who fell one or two standard deviations below the mean. Out of all three sites, five female individuals fell below this range, which can aid in questions pertaining to further research.

[178] *Late Initial Period (1100–800 B.C.) Interaction between the Highlands and Ceja de Selva of North-Central Peru: A Case Study from Canchas Uckro, Eastern Ancash*

This presentation will discuss the results of recent archaeological research at the late Initial Period (ca. 1100–800 B.C.) site of Canchas Uckro. Located in the Puccha Valley, Canchas Uckro is positioned approximately 25 km to the north of Chavín de Huántar and 40 km from the upper Marañón river. Analysis of the pottery assemblage from Canchas Uckro suggest strong parallels with the Urabarriu Phase of Chavín de Huántar. However, a considerable proportion of the pottery also exhibits formal and decorative attributes, such as zone-hatching, which are characteristic of contemporary assemblages from the Marañón, Huallaga and Ucayali drainages. The presence of pottery from these regions suggest that Canchas Uckro was involved in a widespread interaction sphere with cultural groups in the Upper Amazon. The findings from Canchas Uckro have implications for conceptualizing long-standing debates about the role of the ceja de selva during the formative stages of Chavín de Huántar and surrounding regions.

[273] *Why the Chimú State of the Northern Coast of Peru Failed: Rapid Expansion Is Not Always Enough*

In the last 1000 years before the arrival of the Spanish in 1532, the expansionist states of the Andean region of Peru—like those of the Old World—appear to have grown incrementally, flourished briefly, and disappeared. Despite intensive study in the 1970's and since, the inner structure and dynamics of Chimor have eluded archaeologists because there is limited information from European observers and because there are many questions archaeologists have not yet addressed. At its maximum, Chimor extended some 1200 km. from Carabayllo north of Lima to the Zarumilla River at the modern frontier with Ecuador. It had conquered and administered polities which spoke different languages: Quingam, the Muchic-speaking heartland of Lambayeque and Jequetepeque, and the valleys of the far north where Tallan and Sec were spoken. South of the Santa River, Quechua may have been a common language. In this region the economic structure differed. A study of new data and a reexamination of old evidence suggest that Chimor's successes arose from its social and political structure, much like those of its predecessors, the Moche and Lambayeque. However, the seeds of its defeat by the Inka lay in these same institutions.

Neuhoff-Malorzo, Patricia

[299] *Agriculture and Resource Procurement for the Castro Settlements of NW Iberia: Examination of Floatation Samples for the Castro Site of Bagunte*

Collection and examination of botanical remains has led to evidence of the development of agriculture in conjunction with the collection or procurement of wild resources at a number of Castro sites across the NW of Portugal and Galicia. Evidence procured to date from a number of such sites stretching from the Galician Region of Spain to the site of Monte Mozinho near the municipality of Penafiel in Portugal covers a span of time from Early Bronze Age to Roman Period and exhibits a combination of crops produced for human consumption, fodder produced for pastoral practices, and wild resource procurement for diet supplementation. The location of Bagunte lends itself advantageously to both agricultural production and resource procurement for diet supplementation and fuel resources. This presentation will focus on the use of wood for fuel resources, obtained through examination of carbonized wood collected through floatation of soil samples amassed through excavation and the seed samples gathered during previous field seasons.

Neusius, Sarah (Indiana University of PA)

[43] *Animal Use among the Monongahela: Insights from the Analysis of the Johnston Site Faunal Assemblage*

Excavations at the Johnston site (36IN2), a Middle Monongahela village located in western Pennsylvania, have generated a large, generally well-preserved assemblage of faunal remains. Between excavations in the 1950s and those conducted since 2005 by IUP, a significant portion of this large ring village has been sampled. Thus, this assemblage provides a rare opportunity to document the use of animals by the Monongahela. Initial faunal analysis was undertaken by John Guilday of the Carnegie Museum in the mid-1950s. More recently several preliminary studies of the composition and spatial distribution of this assemblage as well as of contrasts between assemblages collected during various excavations have been undertaken over the last decade. It is now possible to synthesize these studies and develop a more definitive statement of this assemblage's implications for reconstructing various aspects of Monongahela life including subsistence, butchering, bone tools, use of space, refuse disposal practices, and social interactions. This paper presents key inferences and makes clear that zooarchaeological analyses contribute significantly to regional perspectives on the Late Prehistoric period in western Pennsylvania.

[213] *The Role of Lowland Tropics as Centers of Landscape Domestication during the Middle Holocene in South America*

The archaeological record of the Middle Holocene is lacking in many areas of lowland South America. The reasons for such hiatuses are yet not clear, but there is an emerging pattern showing that the areas where one finds complete records of human occupation that span most of the Holocene are typically located on estuaries, extensive floodplains or other wetlands normally placed at ecotones. On the other hand, mounting paleoecological data shows that the climatic conditions of the Middle Holocene were probably dryer than today. This paper argues that wetlands and ecotonal areas played a major role as places for landscape domestication and cultural innovation in the tropical lowlands during the Middle Holocene and that such innovations spread through other areas after the establishment of climatic conditions similar as of today starting ca. 3,000 years BP.

[224] *A Structural Geological Study of the Tombs of Nabataean Petra*

Many studies have discussed the first century BC to first century AD Nabataean rock-cut monuments in the Nabataean city of Petra, Jordan. These surveys provide information about proposed chronologies for the façade tombs and limited data about burial customs of the Nabataeans themselves. One neglected topic is the Nabataean tomb placement in relation to the structural geology of the Petra region. During the 2014 field season of the BYU

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Ad-Deir Monument and Plateau project, it was discovered that the Ad-Deir Monument was built between geologic faults and fractures, suggesting that the Nabataeans used these features to carve the façade. In order to study the Nabataean knowledge of geology and the landscape used in the placement of their tombs, I have been working on a survey of the Petra façade tombs, with an emphasis on their relationship to the local and regional faults and fractures. This poster will showcase some of my findings.

[92] *Using Lithic Conveyance to Reconstruct Paleoindian Cultural Landscapes in the Great Basin*

Archaeologists commonly use the geographic patterning of sourced artifacts to understand how prehistoric cultures used their landscapes, yet exactly what this patterning indicates remains unclear. The Paleoindian literature reflects a tendency to assume that toolstone conveyance reflects direct acquisition (i.e., mobility) motivated by subsistence and technological concerns, rather than acquisition (i.e., exchange) motivated by social concerns. Yet the challenge of actually distinguishing between mobility and exchange persists. Here, I offer some ideas that might help us make headway on the linkage problem we confront when attempting to infer mode of acquisition from patterns of toolstone conveyance, focusing on the North American Great Basin. I imagine a Paleoindian cultural landscape defined, not just by the distribution of food and non-food resources, but also other people, to propose that both mobility and exchange, perhaps operating at different scales in relation to subsistence, technological, and social motivations, contributed to the patterns of obsidian, fine-grained volcanic, and chert conveyance that we see.

[268] *Management of WWI Training Trenches in Light of Current Military Training*

More than nine miles of World War I training trenches have been identified on USAG Fort Lee (Fort Lee) in Prince George County, Virginia. Constructed by the 80th Division at what was then "Camp Lee" beginning in the fall of 1917, these trenches represent a significant historic resource associated with the Great War. Fort Lee is also one of only a few locations where such trenches survive in the United States. However, the trenches also pose a significant challenge in balancing mission and training needs with the responsibility of all federal agencies to consider effects on historic properties while meeting the Army's mission. The most pressing need is the development of a long-term management plan, which includes ground-truthing trench segments identified via LiDAR, detailed topographic survey of current trench conditions, and archival research regarding trench construction and use. In 2017, a small portion of the trenches was surveyed to assess feasibility of the proposed work in support of the future management plan.

[255] *Motivations of Indigenous New England Potters and Researchers: Technical Choice, Social Context, and Identity Construction*

Archaeological research on aboriginal ceramics in New England has been limited in content and scope since its beginnings in the late 19th century. Few studies have attempted to connect aboriginal ceramics research with contemporary Native peoples, either through past-to-present identity connections or through Indigenous community engagement. Additionally, there have been few efforts to integrate research across New England's contemporary geopolitical boundaries. Recognizing these deficiencies in regional scholarship, this paper discusses two ceramics studies from New England—each exploring concepts of identity. One study centers on potters living in the Penobscot River Valley in Maine during the Ceramic Period (3050–450 B.P.), and the other focuses on the Late Woodland period (1300–1600 AD) through 17th century potters in the Connecticut River Valley in Massachusetts. Each study applied Indigenous archaeologies and technological choice strategies to an archaeological problem. However, the motivations behind the studies and the social contexts of the researchers influenced the research process and interpretations. This paper reviews these studies and the challenge of using ceramics as a central element in constructing or assigning identity while contemplating the range of factors that influence how researchers make connections between past and present peoples in the geopolitical landscape of New England.

[72] *Oak Flat as a Traditional Cultural Property / Future Copper Mine*

On January 25, 2012, the Forest Service sought assistance from the San Carlos Apache Tribe in evaluating Chi'chil bildagoteel (Oak Flat) as a Traditional Cultural Property (TCP). This request was motivated by a land exchange proposed to congress which would transfer Oak Flat, Forest Service managed land, to Resolution Copper Mine for purposes of ore extraction. Four years later on March 4, 2016 the Keeper of the National Register of Historic Places officially designated Oak Flat a Traditional Cultural Property (TCP).

The interim four years would test the fortitude of both the Forest Service and the Tribe, as Resolution Copper and other mining supporters would work creatively and persistently to prevent the formal recognition of Oak Flat as a TCP. Politicians, organizations, and even local tribal members rallied to testify to the falsity of Oak Flat's validity as a TCP. Hundreds of letters of objection to the nomination would cause the Forest Service and the Keeper to weigh the cost versus benefits of recognizing the cultural paradigms of the Apache people. In this paper, I will examine the nomination process of this highly contested TCP, the interference, the perseverance, and the outcome.

Ng, Chuenyan

[153] *Subsistence Economies among Bronze Age Steppe Communities in the Southeastern Ural Mountains Region, Russia*

The long-standing subsistence model for Bronze Age Steppe Communities in the Southeastern Ural Mountains Region has been defined as a sedentary agro-pastoral strategy with dominant use of livestock. However, based on recent studies, the nature and variability of the subsistence economy, especially wild plant resource exploitation for both humans and livestock, are not well understood. As sedentary pastoral communities, the relationship between increasing livestock productivity and decreasing risk associated with resource sustainability is a continuous process. It is achieved only through control of land for grazing, regulating the composition and size of herds, and the establishment of seasonal herding strategies including foddering. This research undertakes a systematic archaeobotanical and phytogeographical study of subsistence patterns among late prehistoric pastoralist communities during the Middle Bronze Age of north central Eurasia. The multi-disciplinary approach draws productively from ethnographic, anthropological and archaeological evidence, to examine relationships between ancient settlements, local site catchments, and the emergence of new forms of livestock herding that integrated with earlier traditions of hunting, gathering and fishing during the Middle Bronze Age in the Southeastern

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Urals region of Russia. A combination of detailed macro-botanical study and experimental archaeology will produce a new model for understanding early traditions of multi-resource pastoralism.

Nicewinter, Jeanette (American University)

[17] *Abbreviated Imagery on Cajamarca Cursive Ceramics*

Paintings on fineware ceramic vessels and spoons by the pre-Hispanic Cajamarca culture of the north highlands of present-day Peru emphasize an abstracted and expressionistic aesthetic unlike their north coast neighbors, the Transitional Moche culture, and their contemporaries, the Wari state. During the Middle Horizon (c. 600—1000 CE), the Cajamarca culture's paintings developed a greater emphasis on human and animal imagery while maintaining an abstraction of forms. The figures are reduced to brief combinations of lines and are placed within compositions that are tightly filled with dots, spirals and waves. The compression of space and expressionistic handling of paint emblemizes the Cajamarca Cursive style. While the compulsion to fill space has been previously thought of as a motif or filler, the lines accentuate figures and create movement within the image. The proliferation of a small corpus of representational imagery on a variety of Cajamarca bowls, spoons and jars indicates that the image held cultural and social value and was an abbreviated version of a vast body of esoteric knowledge. The identification of key figures and actions is a portion of a larger project to extrapolate the key features of the Cajamarca culture's ideologies.

[166] *"Made Radical By My Own": Acknowledging the Debt Owed to Larry Zimmerman in Radicalizing Me*

All archaeology is ultimately autobiographical; our interests and intentions are intimately shaped by both people and circumstances, which sometimes are not recognized until later. An unexpected change in my own career path in the 1990s brought me into Larry Zimmerman's orbit. His work with and for marginalized peoples, his activism, and his strong ethical stance have grounded me ever since. In this presentation I take a personal approach to discussing Larry's influence on Archaeology in general and on (some) archaeologists in particular, I also discuss the value of understanding the biographical dimensions of the discipline and to what constitutes good practice in working with and for descendant communities.

[262] *Village to City: Formative Period Political Evolution in Central Mexico*

Current research has prompted rethinking about the early development of sedentism, agricultural economies, and complex societies in Central Mexico. We discuss new evidence of significant interconnected changes ca. 1000 BC that through multiple trajectories involved intensified maize production, expansion of sedentary villages, expanded interaction networks, and increased social complexity. With the establishment of the first cities, the Late Formative saw corporate political economy strategies gain in importance while the preceding exclusive networks of prestige exchange that united distant parts of Mesoamerica diminished.

[75] *Late Woodland Cultural Adaptations in the Lower Missouri River Valley: Archery, Warfare, and the Rise of Complexity*

The introduction of the bow and arrow into prehistoric Missouri during the Late Woodland Period possibly changed the Middle Woodland social dynamic and settlement pattern arrangement such that there was a major increase in social cooperation between settlements tied closely to defensive settlement strategies. Small villages faced the possibility of effective, long-range attacks that could potentially lead to the quick application of overwhelming force on unprepared villages. To address this potential, settlements moved to less productive upland locations with inter-visible settlement clusters that provided for mutual defense through defense in layers. As agriculture became better established, this pattern of defense again changed as people nucleated into larger sites in highly productive, lowland areas. Defense was still a significant consideration as reflected in both the selection of defensible topographic settings and the apparent creation of a borderland along the river. The larger number of people in each village provided safety in numbers and decreased the likelihood of overwhelming attacks. The influence of archery and the selection for effective defensive strategies in the face of archery-based warfare could help explain the rapid shift to inter-visible, upland sites during the Late Woodland Period and the subsequent rise of large nucleated settlements.

Nicolas, Richard (University of Wisconsin- Madison)

[8] *Using Sacred Landscape Model of Indigenous Cave Use in the Philippines*

Caves are natural spaces, but like other natural settings, they can be perceived by people through highly variable cultural lenses. Caves are not generally used as utilitarian spaces, but are more often sacred spaces where rituals are performed. The material record of these subterranean features can provide insights for how past peoples connected to the symbolic landscapes of caves, thus affording opportunities to assess behaviors. Research on the ritual uses of caves is fairly new in the Philippines, but cross-cultural comparison holds much promise. For instance, much research has already been conducted in the ritual use of caves in Maya contexts of Mesoamerica, which can be used as a foundation for approaches in other countries. Using best practices from cross-cultural contexts, this poster provides a preliminary analysis of certain cave sites in the Philippines. The research is based on a combination of recent field surveys and secondary sources, and offers a framework for identifying cave sites as sacred landscapes in order to contribute to ongoing studies of indigenous rituals in the Philippines.

Nicolay, Scott (University of California, Merced)

[136] *Offerings in the Mogollon Underworld: Big-Eyed Beings and Birds*

Three Classic Mimbres vessels depict similar ceremonial processions in which individuals carry effigies of animals and/or goggle-eyed beings. The goggle-eyed effigies are versions of a figure common in both Mimbres and Jornada Mogollon rock art that may represent the Mesoamerican rain deity Tlaloc. Similar effigies have been recovered from five cave shrines in southern New Mexico and Arizona: two wooden goggle-eyed figures and one of stone, and two wooden birds. However, modern Pueblo informants recognize neither this ceremony nor its apparatus. Together these effigies and their depictions represent a once-widespread but now extinct tradition related to rainmaking and the underworld.

Nielsen, Axel (CONICET Argentina)

[181] *Chullpas and the Political Relations with the Inside-World in the Inka Empire*

Previous research has interpreted chullpas as open sepulchers, altars, and landmarks which participated in political projects mainly by helping to reproduce corporate identities through ancestor worship and by inscribing power hierarchies and territorial claims on the landscape. This paper builds on the premise that chullpas were not just things with a certain function, but non-human persons (wak'as) capable of acting in different ways, given the affordances of their corporeality as towers or chambers. This idea raises new possibilities for thinking about the political work of chullpas in the Andean

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

highlands. The formalized opening that characterizes these structures, for example, allowed them to mediate between the world of people (akapacha in Aymara) and the inside-world (ukhupacha), where powerful agencies lived. Combining historical information and archaeological data from the South Andean highlands, I discuss the role that chullpas played in the Inka political machine as mediators with the non-human members of society who belonged to the ukhupacha.

[209] *A Dark Horse of the Early Postclassic: The Site of El Cerrito (Querétaro, Mexico) and Its Relationship to Chichen Itza and Tula*

Ever since the first attempts to explain the close correspondences (in iconography, architecture, and writing) between Chichen Itza and Tula in the Early Postclassic it has been assumed that it was mainly between these two cities, sometimes even called "twin Tollans", that the extended and intense contact between Northern Yucatan and central Mexico took place. A tendency among Mesoamericanists not to look further to the north and west, to present states such as Guanajuato and Querétaro, have thus led to the surprising oversight of the major site of El Cerrito in Querétaro. A thriving and important player of the period, El Cerrito displays iconography, sculpture and writing that is essentially indistinguishable from what is known from Tula and Chichen Itza, and the site's largest structure, the "Basamento Piramidal" (25 m in height), is a perfect example of a radial pyramid, similar to the Temple of K'uk'ulkan at Chichen Itza. In this paper, we briefly review current knowledge about El Cerrito and present our preliminary thoughts on its possible role in the Early Postclassic networks of trade, political alliances and intense cultural exchange. From this it follows that the architectural template for these three sites are to be found elsewhere.

[138] *Solutions for Stabilizing and Caring for Organic Archaeological Collections*

Care of archaeological materials should begin in the field. Care and stabilizing of objects, if started in the field, will greatly increase the objects research and exhibit potential when it finally finds a home in a museum. How do you identify problems and then what do you do? Proper care and stabilization of objects can and should be a priority for all object users—excavators, lab analysts, museum staff, and researchers. In this paper, object care, conservation environments and stabilizing techniques will be discussed for organic archaeological objects.

[200] *Evaluating the Effects of Human Disturbance on Middle Stone Age Surface Finds from Northern Malawi*

Abundant surface scatters of Middle Stone Age artifacts are found throughout northern Malawi, eroding from remnant alluvial fan deposits (Chitimwe Beds). Surface surveys documenting these areas have guided the emplacement of 50+ archaeological test pits and excavations, many of which have yielded in situ MSA sites. However, the surficial evidence itself has been subject to less discussion and merits closer attention. At the Bruce site, surface artifacts were identified as part of an assemblage originally excavated in 1965, but which has since undergone significant disturbance from local development. Recent excavation and surface collecting by archaeologists has had an additional impact on the site. Bruce contrasts with localities like the similarly aged White Whale, ~40km to the south, where surface finds evidence a well-preserved knapping surface exposed by erosion near a cliff edge, that nevertheless retains spatial integrity. We use these case studies to discuss assumptions associated with surface finds, the role and influence of archaeological research on the integrity of surface and subsurface assemblages, and the relative stability of archaeological landscapes. Finally, we examine the potential for assessing landscapes modified by agrarianism—which may obscure or erase surficial archaeological materials—using declassified CORONA satellite imagery collected from 1959 to 1972.

[20] *Little Ice Age Impacts on Traditional Māori Fisheries: Preliminary Results from North Island, New Zealand*

Numerous paleoclimate proxies indicate the Little Ice Age caused marked declines in New Zealand's atmospheric and sea surface temperatures for much of the period between 1450 C.E. and the end of the nineteenth century. These trends could have keenly affected the productivity of marine fisheries, which have always been critically important to Māori, the indigenous peoples of New Zealand. Considering the close connections that continue to exist between traditional fisheries and Māori economic, social, and spiritual life, it is likely that any changes in fish populations would have had wide-ranging effects on people's lives in the past. In this paper, I explore the ways that studying the top-down effects of climate change on traditional Māori fisheries shed light on developments in pre-colonial Māori history, and present preliminary results for the analysis of archaeological fishbone assemblages from the northern North Island, New Zealand.

Nimura, Courtney (Griffith University)

[113] *Considering Seascapes, Waterscapes and the Relational*

This paper introduces some key themes for this session, and considers how seascapes and waterscapes relate to the many and varied people, things, and places with which humans live. While many aspects of the archaeological record can be interpreted as referencing the watery realm through association (e.g. shell middens) or visual cues (e.g. rock art), our goal with this session is not to focus on simply identifying these connections, but to interrogate the nature of these relationships—to consider how water acts as a relational presence, and one that is informed by epistemologies and ontologies. Writing in the context of maritime people in Australia, McNiven (2008, 149) identifies a 'relational nexus between people, spirits, and the sea'—a useful observation that orients our thinking about the various elements that can be used to explore the water/people relationship. We will introduce some of our thoughts on the complex relational aspects between people, things, and water as a way of better understanding the social/cultural networks in which they are embedded, and the myriad ways people construct, maintain and express their identity. We draw on archaeological, ethnographic and historical resources to introduce the relational through the lens of the watery realm.

[70] *Japanese Archaeological Artifacts in the U.S. Museums: A Case Study from the World's Columbian Exposition of 1893*

There are thousands of Japanese archaeological artifacts stored in the major arts and archaeology museums of the United States. Many of the collections came to this country during the late 19th and the first half of the 20th centuries. In those days, archaeological objects left their home countries more readily than today and reached at the foreign museums through expeditions, inter-institutional exchanges, purchases from private art

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

galleries, and gifts from wealthy art collectors. Unfortunately, only a portion of these objects are currently on display in these museums, due primarily to the lack of proper investigation on these artifacts. I have been collaboratively working on a compilation of a catalogue of these artifacts for publication. Not only will it shed important light on the movement of such valued artifacts from Japan to the United States during the past 150 years; but it will also make the collections available for research and education across this country. A Japanese archaeological collection in the Penn Museum that was displayed at the World's Columbian Exposition of 1893 in Chicago exemplifies the movement of such collections to this country. A proper investigation will make this collection a valuable asset for research within this country.

Nishizawa, Hideyuki**[300] *What Does the "Cruz Pata" Style Look Like?: Redefining an Enigmatic EIP Ceramic Style of the Ayacucho Valley***

Dramatic culture change occurred in the Central Andes at the onset of the Middle Horizon (MH) (AD 500–1000). During this period, a state society emerged in the Ayacucho Valley and expanded across Peru. Even before the emergence of this state, however, culture contact of the Ayacucho heartland had already started with some remote regions in the late part of the Early Intermediate Period (EIP). This far-reaching contact would have gradually been intensified toward the beginning of the MH. Indeed, such cultural influence can be seen in Ayacucho ceramics during this transition. One good example is an EIP Ayacucho ceramic style known as "Cruz Pata." It has been pointed out that this particular style bears the first indication of south coast influence of the Nasca culture. Despite being important, the Cruz Pata style has been poorly defined in the literature, and it has yet to be investigated more fully so that we can better understand the arrival of Nasca influence and its ensuing impact upon the emergence of the Huari state. This paper characterizes the Cruz Pata style by examining the ceramic assemblages recovered at the site of Huari in 2017, and redefines it in relation to other Ayacucho styles.

Nissen, Zachary (Northwestern University)**[28] *A Monumental Afterlife: Reconfiguration and Reuse at Aventura, Belize***

Previous research suggests that the ancient Maya city of Aventura, Belize thrived during the Terminal Classic to Early Postclassic periods (800–1100 CE). During this period, occupants of the city constructed up to 27 buildings within the confines of the site's A plaza. This paper presents the results of the 2017 test excavations of a sample of the A plaza buildings. Maya plazas are typically conceived of as large open places for ritual and political performance. However, these excavation findings suggest that this period was not static, and city occupants reworked their relationships to the monumental site core by reconfiguring the layout of the main plaza and reusing materials from earlier buildings. These practices of reconfiguration and reuse likely even continue into the later part of the Postclassic period. This paper considers how this transitional period at the site fits in with trends of reuse and reconfiguration throughout northern Belize and parts of Mexico's Yucatan Peninsula during a period of instability and change across the Maya lowlands. Finally, it will theorize the impacts these actions and activities may have had on the daily lives of the city's inhabitants.

Noack Myers, Kelsey, Joshua J. Wells (Indiana University South Bend), Stephen Yerka (University of Tennessee Knoxville), Sarah Whitcher Kansa (Alexandria Archive Institute) and David Anderson (University of Tennessee Knoxville)**[53] *Making Archaeological Data Publicly Accessible through the Digital Index of North American Archaeology***

Scientific research conducted during the process of environmental review has been publicly and openly criticized by governmental officials in recent months. Not only does this represent an official contestation of the value of this research in the public eye, it seeks to undermine the credibility and legitimacy of science as a discipline. The research in question is federally mandated, and in the case of Section 106/Title 54, exists to avoid unnecessary harm to historic properties. If we seek to maintain an accurate record of American heritage, inclusive of all parts and parties of our history throughout human existence on the North American continent, it is vital that this work continues. However, the reporting mechanism for this information faces the risk of ending with seemingly useless binders of paper if not made publicly and openly available for re-use and analysis by researchers, officials, students, and the general public. This poster demonstrates the power of the Digital Index of North American Archaeology (DINAA) to make this information relevant, valuable, and visible to those who are skeptical about the value of compliance work.

Nolan, Kevin (AAL, Ball State University), Mark Seeman (Kent State University) and Mark Hill (Ball State University)**[74] *Time, Scale, and Community: Hopewell Unzzyotic Social Systems***

Timing of Hopewellian developments plays a critical role in developing an understanding of how Hopewell came to be, and what it was. Focusing on the Scioto Hopewell sites studied by the Scale and Community in Hopewell Networks (SCHON), we present the results of 40 new radiocarbon dates obtained from 15 sites including both habitation and earthwork sites. We also undertake an evaluation of previous dates from these sites to come to a more robust understanding of the timing of key Hopewellian events. Previous models are based on cross-dating inference derived from assays that have never been previously subjected to quality assessment. We provide the first dates on many sites, and the most carefully selected suite of dates for all of the included sites. Our results call into question some of the narratives advanced by previous investigators for the region, and for specific sites.

Nolan, William and Jerald Ek (WWU)**[302] *Shellfish Harvesting, Subsistence Strategies, and Human/Environmental Interactions in the Río Champotón Drainage, Campeche, Mexico***

With regional occupational continuity from the Middle Formative through Postclassic Periods, the Río Champotón drainage provides an ideal case study to examine long-term change in ancient Maya subsistence strategies and human/environmental interactions during two and a half millennia of human occupation. This poster presents the results of analysis of an assemblage of over 13,000 shell artifacts generated by the Champotón Regional Settlement Survey during seven seasons of research in the Río Champotón drainage and the adjacent central coast of Campeche, Mexico. Patterns of shellfish exploitation documented in the region were embedded within broader changes in regional subsistence systems. The results of this study indicate that the long-term sustainability of sedentary communities in the region was due to two factors: the availability of diverse food resources; and adaptability, defined as the ability of communities to alter subsistence practices in the face of changing ecological, political, and social conditions. This is particularly notable during the Late and Terminal Classic Periods, which witnessed the decline and demographic collapse of urban centers across many regions of the Maya Lowlands. The central role of adaptability provides an important long-term case study in sustainability and resilience with broad relevance in the social and environmental sciences.

Noldner, Lara (University of Iowa Office of the State Archaeologist) and Jennifer Mack (University of Iowa Office of the State Archaeologist)**[88] *Oneota Burial Practices: A Case Study from the Dixon Site (13WD8)***

Past populations that are associated with the Oneota archaeological tradition appear to have practiced a variety of burial practices. This paper serves as a presentation of another case study that contributes to our knowledge base of Oneota burial practices. Contexts for human skeletal remains recovered from Oneota sites range from scattered isolated elements to primary burials (both extended and flexed) oriented in various directions, both within constructed mounds and other non-mound features. This paper summarizes the human skeletal remains recovered through 2016–2017 archaeological excavations at the Dixon Site (13WD8), as well as remains that were exposed in past years by both controlled excavations and stream bank erosion. The site is an extensive Oneota village site that was initially exposed by re-routing of the Little Sioux River in 1913. Recent archaeological investigations were necessary for the much needed stabilization of the river bank.

[80] *Settlement Pattern and Land Use Dynamics at Naachtun: Shaping an Agrarian Maya Town*

The classic Maya site of Naachtun is actually composed by a monumental and public core zone of 35 hectares surrounded by an extensive residential area of about 175 hectares. The study of its settlement pattern along with geoarchaeological works focused on agrarian strategies specifically have shown the role of vacant spaces in shaping the settlement as an agrarian town. Mainly dedicated to agriculture since the beginning of Naachtun's occupation in the Early Classic period and maintained until the abandonment, these vacant spaces can be used (with others parameters) to identify neighborhoods and evaluate the importance of the agrarian constraint in urbanization and spatial layout of this town. In this paper, we will first present the up-to-date analysis on inner-city neighborhoods dynamics during all the Classic period. Then, we will compare the residential density, composition and spatial organization of these neighborhoods with the first data observed, at a larger scale, in the Naachtun hinterland on the basis of the 140 km² LiDAR survey.

[154] *A Geochemical Look at Obsidian Procurement and Exchange in the Medio Period World: A Case Study 76 Draw (LA 156980)*

Geochemical provenance analysis of obsidian is a productive avenue for studying social interaction and lithic raw material procurement strategies in the U.S. Southwest. Here the results of the analysis of 180 obsidian artifacts recovered from 76 Draw, a Medio period (A.D. 1200 to 1450) settlement in New Mexico are presented. The combined assemblage reflects local geochemical sources, as well as obsidian from more distant geochemical sources often seen in assemblages associated with the Ancestral Pueblo (Anasazi), the Salado people, and the Casas Grandes phenomenon during the mid-1300s. This assemblage was compared to lithic assemblages from the nearby Black Mountain site in southern New Mexico and Casas Grandes settlements in the Medio period core around Paquimé, Chihuahua, Mexico. Obsidian from sites in the Medio period core area geochemically matches sources in northern Chihuahua and northeastern Sonora, whereas the Black Mountain obsidian reflects greater reliance on the northern Mule Creek obsidian and other nearby sources. While inhabitants at 76 Draw likely had access to Mule Creek obsidian and associated sources through contact with bordering cultures, they maintained an active partnership in the Southern Network of procurement and exchange centered around obsidian sources from northern Chihuahua and the boot heel of New Mexico.

[117] *Revitalizing Native Practices in the Face of Colonialism: Taki Onqoy and Entanglement in the 16th Century (Ayacucho, Peru)*

In the 16th century Andes (1532–1570s), conquest was not a rapid event, but rather an asymmetrical process in which Spanish authorities negotiated governance and conversion with indigenous and Inka established orders. New Spanish dictates were initially met with a variety of responses from local groups: alliance, manipulation of Spanish policies, and even violent rebellion by Inka holdouts. In the central highlands of Peru, local groups developed and participated in a revitalization movement which preached the rejection of Spanish goods, culture, and religion, in favor of a return to huaca (local deity) worship. Known as Taki Onqoy (quechua: dancing sickness), individual practitioners transformed their local beliefs, renouncing new Spanish rites and instead adopting the behaviors of a perceived idyllic (nativist) past. Excavations at the site of Igleiachayoc (Ayacucho, Peru), a known Taki Onqoy center, demonstrate a varied response to Spanish conversion—while some appear to have fully committed to the movement, others were caught between Spanish authorities and local takiongos, and strove to placate both sides. Although ostensibly a purely “native” movement, aspects of Taki Onqoy were hybridized with Spanish Christian religion, leading to a form of religious resistance which was entangled with the very religion it was designed to oppose.

North, Chris (PaleoWest Archaeology) and Scott Courtright (PaleoWest Archaeology)

[268] *Urban Archaeology at the Hohokam Village of Pueblo Grande*

PaleoWest Archaeology recently completed two data recovery projects at the east and west ends of the seminal Hohokam village of Pueblo Grande in Phoenix, Arizona. The two projects were in the last two undeveloped parcels of Pueblo Grande, which was the largest and most influential Hohokam village in the lower Salt River Valley. Despite more than a century of historic use of these parcels, which included residential and commercial developments, substantial prehistoric archaeological deposits remained intact. The purpose of this poster is twofold: 1) to present the archaeological data from these projects and how they compare to previous archaeological work at Pueblo Grande and 2) to demonstrate how significant subsurface deposits can remain intact, even in areas of intense historic disturbance.

Norton, Brandy

[111] *What's for Dinner: An Examination of Animal Resources Utilized in the Okeechobee Basin Area of Florida*

In order to gain a better understanding of the faunal diet composition of Native Americans in south-central Florida, an examination was conducted to determine which types of animals appeared most frequently within tree island assemblages. Of the 19,149 bones examined from a 2016 excavation, all were identified to at least an animal's taxonomic order, although identification to the species level was usually not possible due to the fragmentary nature of the sample. This information was compared with radiocarbon data to determine changes to diet through time as well as with oral histories from Seminole community members in order to compare stated dietary preferences with prehistoric evidence. The study determined that the three most prominent animal types present are turtle, fish, and snake, and that there were fluctuations in animal composition present throughout time which may indicate a changing environment and differential resource availability and exploitation. There is strong evidence that climatic changes, specifically the Little Ice Age, had an impact on the diets of tree island inhabitants. Understanding the environmental changes through time and their impacts on subsistence patterns indicate the ways in which tree island inhabitants reacted to these environmental changes.

[110] *Is It Christmas Yet? Teaching Evolution to a Resistant Public*

As an anthropologist I pride myself on seeing the value of diverse worldviews. However, as a biological anthropologist I continue to struggle to communicate effectively with students whose worldview denies the authority of science and the theory of evolution. In this paper I present a case study,

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

an ongoing negotiation between myself and a student in my introductory class who insists on a formal in-class debate between evolution and creationism. That many scientists do not find religious beliefs and evolution mutually exclusive so far falls on deaf ears. I refuse to place creationist concepts at the same level as evolutionary theory, particularly in a science class. I argue that the core of this conflict is as much about intellectual authority as it is evolution. Our mutual refusal to accept the other's point of view is a microcosm of the contemporary political climate. Still, I feel professionally and personally compelled to communicate with and educate this student. How do we teach to a public that insists that core principles of the discipline are still debatable?

Novotny, Claire (Kenyon College)**[110]** *Between Government and Grassroots: Archaeologists and Social Justice in International Contexts*

Working at the community level is a crucial component of an engaged, socially just discipline. Advancing archaeology towards greater inclusivity is an increasingly common conversation within the discipline. The majority of literature on this topic focuses on grassroots efforts to include marginalized descendant communities or other stakeholders in research design, implementation, knowledge dissemination and curation. An ever present and often unanalyzed aspect of research (especially abroad), are the required negotiations with government officials, who are political stakeholders invested in maintaining the status quo. These negotiations can be source of friction among research goals, community commitments and governmental regulations. My research in the Toledo District, Belize, shows that dealing with political realities while staying committed to social justice and engagement is an uncomfortable but vital balance to be struck. I argue that archaeologists can work as advocates to keep open lines of communication with governments as well as local people; we hold a privileged though awkward position that can be carefully and strategically leveraged for social justice aims. Anthropological archaeology has much to offer if we use it as a tool for greater inclusivity and social justice, within our borders or abroad.

Nowak, Jesse (University of Oklahoma)**[40]** *Fort Walton Formations: Examining Geospatial Trends in Artifacts and Architecture at the Lake Jackson Site in Florida*

Located in Northwest Florida, Lake Jackson is a Fort Walton (Mississippian) period site with seven mounds, borrow pits, wall-trench architecture, and mortuary objects suggesting interregional interaction. This work examines geospatial relations between artifact distributions, known structural remains, and mound alignments in relation to the landscape. New excavation data from previously unexplored areas and digital presentations of associated artifact densities allows for new views of occupation patterns. These data suggests that the creators of Lake Jackson developed coordinated alignments of features and continuity in community patterns.

Nowell, April (Univ of Victoria-Dept of Anth)**[87]** *Life and Death of the Pleistocene Child: Children's Burials in Gravettian Europe*

The Gravettian (ca. 28,000–21,000 BP), has been referred to as the "Golden Age" of the European Upper Paleolithic. Innovations in technology, increased sedentism and the development of larger regional centers, the oldest known ceramics, some of the earliest evidence for loom-woven textiles, and the emergence of so-called "Venus" figurines all characteristic of this period. The Gravettian is also well known for its often spectacular single, double and triple burials of sub-adults including infants. This paper brings together data from sub-adult burials in Germany, Portugal, Italy, Russia, and the Czech Republic and highlights regional similarities and differences in burial location, body placement and engagement between interred individuals, known pathologies, associated artifacts and evidence of ritual. In the context of the increasing social and technological complexity of this period, inferences are made concerning the lived lives of sub-adults in the late European Pleistocene.

Nowell, April [41] see Chang, Melanie

Nowell, Sarah (University of Georgia)**[36]** *Inferring Continuity and Growth from Household Expansion at the Xwisten Bridge River Site in British Columbia*

The processes that drive socioeconomic and demographic growth over the course of generational occupations can be better understood by examining the variation in spatial organization at the household level. This study draws from the ethnographic record, ethnoarchaeological studies, and household archaeology to compare features from Housepit 54 at the Xwisten village, or Bridge River site in the interior of British Columbia. This site has been previously classified as a winter village and contains over 80 structures, or semi-subterranean pithouses. Housepit 54 was excavated between 2012 and 2016 and contains a sequence of 17 intact anthropogenic floors. Past research implies that changes in quantity and types of features associated with storage activities indicate varying strategies. When combined with lithic data related to hunting activities during times of ecological stress, I suggest that over the course of generational occupations, residents of Housepit 54 engaged in community feasting or other activities in order to increase the social standing of the household within the village.

Our presentation, based on an overview of archaeobotanical data from the Aegean from the Neolithic to the Late Bronze Age, attempts a synthetic approach to the cultivation of trees. This work is part of the PLANTCULT research project funded by the European Council Research (ERC Consolidator Grant, GA 682529). As archaeobotanical data we consider the macro-remains of fruits/seeds and burnt wood from archaeological sites. In addition, we use palynological information when available. Our goals are: A) to investigate the characteristics of the natural local vegetation around the Neolithic and Bronze Age sites in the study area, B) to investigate the presence/absence and frequency of occurrence of trees that became incorporated in the diet, economy and trade of the prehistoric Aegean, and C) to comment on the cases of the almond tree and the olive. More specifically for the olive tree, based on mapping the presence of the plant in the archaeobotanical record, the beginnings of olive cultivation and the factors that led to it are discussed.

Nuevo Delaunay, Amalia (Centro de Investigación en Ecosistemas de la Patagonia), Juan Belardi (Universidad Nacional de la Patagonia Austral, Unid) and Flavia Carballo Marina (Universidad Nacional de la Patagonia Austral, Unid)**[155]** *Post-contact Times in Southern Patagonia*

The history of the different indigenous hunter-gatherer groups that inhabited Patagonia since the Pleistocene was profoundly affected by the arrival of Europeans during the sixteenth century. This resulted in significant changes in various aspects of their lifeways, both archaeologically and ethnographically recorded. We integrate the available archaeological data of the post-contact period in southern Patagonia, along with ethnographic and historical data; showing the heterogeneous and complex scenario that characterized the region even until the XXI century.

Núñez, Claudia (PUCP)

[257] *Vinculos (in)visibles: Relationships of Power in the Colesuyo during the Inca Empire*

It has been suggested that Inca colonization strengthened kin bonds between ayllu members while at the same time requested tribute by means of establishing "fictive" kin affiliations. Therefore, subjugated populations response to Inca imperialism caused the consolidation of local and regional identities. However, what occurred in the Colesuyo? Colesuyo region of southern Peru, inhabited by multi-ethnic small-scale groups—the Cochunas from the upper Moquegua Valley and the Coles and Camanchacas from the coastal area; archaeological evidence suggests that although the Cochunas were incorporated into the empire through institutions and kin bonds, the latter, on the other hand, did not create any kinship alliances with other coastal or marginal groups. It suggests, instead, that altiplano elites formed kin relations with coastal groups that in fact formed part of the Inca sphere of influence. In this presentation we analyze the intricate ways in which local groups were portrayed in the historical records and how discourses were built to give an account of the colonial narratives and the Inca dynamics themselves; and try to build a different one that visibilizes alternative social dynamics evidenced in overlooked archeological data.

[287] *Feeding and Consuming: Ceramic Vessels and Cibola Foodways*

To examine relationships between social transformations and household and communal foodways, this paper draws on detailed vessel form, surface treatment, size, and deposition data from multiple settlements over a period of rapid aggregation, migration, and social change in the Cibola/Zuni region in the 13–14th centuries A.D. Foodways—the ways we produce, prepare, and consume foods—are an important part of human society and culture, and play a vital role in making and maintaining social relationships. In the US Southwest, ceramic vessels were essential tools in nearly every task associated with the production, preparation, and consumption of food, making them an ideal source of data for understanding changes in food practices at multiple scales. Different uses of similar ceramic forms between contemporaneous settlements suggest persistent diversity in certain cuisine practices, while cross-cutting shifts in the sizes of ceramic bowl and jar forms hint at the widespread social and political importance of food in communal life in these periods.

[36] *Trailing Lewis & Clark: Inventorying Prehistory at the Point of Contact*

During their 1803–05 westward journey, the Lewis and Clark Expedition described the presence of native graves, mounds, abandoned villages, and rock art. Previous archaeological research, centered around the 2005 Bicentennial, focused on the verification of campsites used by the members of the Corps of Discovery. Public interpretation of their Trail has likewise focused on the explorers themselves, neglecting both the Native context in which they traveled as well as the deeper history of their chosen route. This inventory re-examines the antiquities noted by the expedition through the lens of current archaeological research, to examine the rivers and trails utilized by the Expedition as long-distance trade routes, migratory pathways, and sacred spaces for the people who lived along them. Highlighting this deeper Native history and contextualizing the Euro-American observations provides a pathway to decolonizing public interpretations of the Lewis and Clark Trail.

[157] *Bench Please: A Comparative Analysis of Bench Features in Mesoamerica*

Archaeologists have argued for numerous functions of the bench features found throughout the Maya world ranging from utilitarian to ritual. During the 2017 field season at the Late Classic site of La Obra, excavations of a centrally-located structure revealed a bench standing approximately 50 centimeters from the structure floor and extending out approximately 150 centimeters from its northern wall. La Obra is a hilltop production site located approximately one kilometer northwest of the central plaza of the site of La Milpa in the Programme for Belize perimeter. No other residential structures have yet been identified among those known and the existence of the well-preserved bench and plaster floors presents a conundrum given the site's characteristically poor preservation. The goals of this study are to provide comparative data on the form and function of benches throughout the Maya world from which to better interpret the context of the bench found in Structure NW-1 and its role at the site of La Obra given a relative lack of associated diagnostic artifacts.

O'Brien, Matthew, Todd Surovell (University of Wyoming) and Randy Haas (University of California, Davis)**[124]** *Using Ethnoarchaeology to Identify Spatial Patterns of Behavior in Domestic Dogs*

Domestic dogs (*Canis familiaris*) are a common presence in nomadic cultures, but archaeology still struggles to identify them in the absence of their faunal remains. What we lack is a means to identify behaviors that manifest themselves in the archaeological record that are in clear association with domestic dogs. One avenue is carnivore modified bone. What experimental studies indicate is that we can isolate patterns of feeding associated with particular carnivores, but what has not been demonstrated is whether we see differences between domestic and wild canids. We propose that one solution is to move beyond the marks on the bone and look at where they are found in campsites. Through our ongoing ethnoarchaeological study of the Dukha reindeer herders of north-central Mongolia, we use GPS tracking, photogrammetry, and mapping of canids and modified bone to isolate spatial patterning of domestic dog behavior. The spatial signatures of dog behavior may serve to distinguish occupational bone modification by domestics from post-occupational scavenging behaviors by wild canids.

O'Brien, Melanie (National NAGPRA Program, NPS)**[322]** *Discussant***O'Brien, Michael (Texas A&M—San Antonio)****[120]** *Contemporary Views on Clovis Learning and Colonization*

The timing of the earliest colonization of North America is debatable, but what is not at issue is the point of origin of the early colonists: Humans entered the continent from Beringia and then made their way south along or near the Pacific Coast and/or through a corridor that ran between the Cordilleran and Laurentide ice sheets in western North America. At some point they abandoned their arctic-based tool complex for one more adapted to an entirely different environment. The dispersal of that new techno-complex—Clovis—allows us to examine, at a fine scale, how colonization processes played out across a vast continent that at the time had at best a very small resident population. Clovis has figured prominently in American archaeology since the first Clovis points were identified in eastern New Mexico in the 1930s, but the successful marriage of learning models grounded in evolutionary theory and modern analytical methods that began roughly a decade ago has begun to pay significant dividends in terms of what we know about the rapid spread of human groups across the last sizeable landmass to witness human occupation.

Ochoa Castillo, Patricia**[262]** *Dinámica cultural durante el Formativo Inferior y Medio en la Cuenca de México: Tlatilco y Tlapacoya*

Dos de los sitios más relevantes en el Centro de México durante el Formativo Inferior y Medio fueron Tlatilco y Tlapacoya, los que presentan una gran riqueza cultural. Sin embargo, la relación entre ellos y la función que tuvieron en su época son grandes interrogantes que aún persisten; esta revaloración será abordada a través de la revisión y comparación de sus materiales arqueológicos (cerámica y figurillas), incluyendo los de otros sitios ubicados tanto dentro, como fuera de la Cuenca de México.

O'Connell, Tamsin (University of Cambridge)**[137]** *Isotopic Analysis for Palaeodiet and Geolocation*

Isotopic analysis as a method of assessing diet or geographical origin is now ubiquitous in archaeology, to the point where seemingly no project is complete without it. The relative ease of sample preparation and increasing prevalence of isotope mass specs has contributed to its rapid growth. Yet despite its ease of execution, it is not a cut-and-dried technique, and data interpretation can be complex. The greater use by specialists and non-specialists has resulted in studies that range from excellent to dubious, from groundbreaking to mundane, even banal. Such a situation has also arisen in other areas of the archaeological sciences, making them victims of their own success. Only greater understanding of the strengths and limitations of such analyses can improve the overall quality of work in this field.

This paper outlines the principles of carbon, nitrogen, oxygen and strontium isotopic analyses. It illustrates the technique's scope, identifies some key assumptions as well as pitfalls and problems, and covers some of the common misconceptions in how the method is applied. Whilst I hope not to be prescriptive, I aim to offer some guidance in how such work should be approached, from the perspective of both practitioner and consumer.

Odess, Daniel (National Park Service)**[193]** *Discussant***ODonnabhain, Barra (University College Cork, Ireland) and Jonny Geber (University of Otago)****[296]** *Irishness and the Bodies of the Poor in the 19th Century*

Mid-19th century Irish identities divided along lines of class, religion and gender but it could be argued that all were constructed in an atmosphere of the negative characterization of the island and its inhabitants by the British elite. Race and low "moral character" were blamed for the endemic poverty of the island. The Irish poor were portrayed as a "race apart" whose inherent failings were at least partly to blame for the mortality they suffered during the Great Famine of 1845–1852. Recent excavations at Kilkenny workhouse and Spike Island convict prison have produced skeletal assemblages from this critical period. These collections have enabled bioarchaeological analysis of parameters mentioned by the Victorians as indicative of the distinctiveness of the Irish poor: stature, interpersonal violence, and tobacco-use. We argue that the differences between Irish and British populations in stature and risk of violence were exaggerated. Such characterizations, we suggest, were part of a strategy of "othering" that served to legitimize colonial domination. This exertion of power did not go uncontested, and we argue that aspects of both the material culture and the skeletal evidence may be indicative of forms of passive resistance.

[20] *Thermal Processes on Tropical Archaeological Shell: An Experimental Study*

Tropical archaeological shell middens throughout Australasia provide valuable information about subsistence practices, environmental changes, and human occupation. One of the major anthropic processes that can occur in any midden site is burning or heating of the shell, either from cooking or heat-treating shell for working.

Thermal influences on marine shell are poorly understood across all disciplines, including archaeology. Burning or heating may not always show any visual signs and rather can only be identified through erroneous results when dating or chemical analyses have been undertaken. Recent studies have begun to explore changes in structural and chemical aspects between varying burning/heating methods and durations, however, these studies only focus on a few shell species from the Mediterranean and fail to factor in overall microstructural differences between shell species.

Therefore, to better understand the processes of burning/heating on shell in tropical sites of Australasia an experimental study was undertaken. Six tropical marine shell species with varying microstructures were chosen to undergo three methods of burning/heating. These samples were then examined under Dinolite, SEM as well as under-going XRD analysis. Results show distinct differences between the various microstructures, both visually and chemically.

[134] *Revisiting the Mortuary Function of Chultunes*

Excavations at Mul Ch'en Witz uncovered a series of chultunes just below the escarpment on which the ceremonial core of La Milpa is located. Of the six chultunes identified during the 2017 field season, Chultun 3 has produced the most cultural material. In addition to several complete vessels excavated, human bone fragments were recovered. The remains, found next to the chultun capstone, revive questions surrounding the mortuary function of chultunes. Dennis Puleston, among others, considered the mortuary use to be both secondary and infrequent. Thus, the presence of burials in chultunes was consigned to a marginal position in the attempt to understand chultun function. While the mortuary use of chultunes is indeed secondary, recent work has found it to occur far more frequently than acknowledged. If human burials in chultunes occur regularly, there must be a logical link between the primary and secondary uses. This presentation explores that relationship.

Ogburn, Dennis (University of North Carolina at Charlotte)

[257] *Inca Views of the Native Groups of Southern Ecuador*

Over time, the Incas created varying narratives surrounding the native groups of southern Ecuador, including the Paltas, Cañaris, and coastal groups, such as the Punaes. I examine these narratives through historical accounts from both northern sources and Cusco-centric writers, which serve as our primary sources of information, and compare these to archaeological data, which are mainly limited to the Cañari region. These narratives are the product of the history of Inca interactions from initial contact and conquest through the subsequent impacts of colonization, Inca civil war, and Spanish conquest, and they present attitudes toward those groups that range from indifference (Paltas) or scorn (Punaes) to respect (Cañaris). How the Incas treated these groups had impacts on how their ethnic identities were transformed or maintained during the Inca and Spanish Colonial eras, and show a pattern of consolidation of numerous smaller, related groups. Overall, the Cañaris fared best, and there are even documents revealing aspects of their own narratives of who they were during the Inca era. In contrast, the Paltas and the coastal groups were less favored by the Incas, and we have little of their own voices preserved in the historical record.

[215] *Migration, Ritual, and the Dead*

Migration of human populations is an ancient and persistent part of the history of humankind. In the past, as in the present, migration continues to be a solution to human problems that carries with it some degree of increased risk and challenges for group and individual security and identity. Vulnerability resulting from migration choices, and practices to mitigate risks of that vulnerability, vary between historically situated populations and within groups by age, gender, and other elements of identity. In this paper, cross cultural practices of mitigating risk associated with migration are examined with particular attention to the use of ritual practices. Ritual practices of the Oneota tradition (ca. 1000–1600 CE) involving the dead and the spatial aspect of those practices within the context of migration events are examined.

O'Hara, Nolan (Binghamton University), Tiffany Raymond (Binghamton University), Carl P. Lipo (Binghamton University) and Hannah Elliott (Binghamton University)

[265] *Thermal Properties of Prehistoric Ceramic Vessels of the American Southeast*

A common class of prehistoric ceramic vessels are those that share attributes related to the processing, cooking, storage and serving of food resources. Depending on the specifics of the use contexts, attributes will vary systematically and depend on the range of activities, the details of the food resources, and the heating technology in which the vessels are used. Thus, we can expect that many technological traits of vessels such as temper, wall thickness, porosity, firing temperature, and manufacturing techniques will be systematically shaped by local performance conditions. One key dimension of variability that is directly associated with the performance of vessels to cook food is thermal conductivity: the rate at which heat is transferred from one side of the vessel wall to the other. The physical properties of ceramic vessels are key to understanding how an object insulates, conducts, or withstands temperature change. In this study, we examine variability in thermal conductivity of prehistoric ceramic samples from the American Southeast and explore the compromises made by prehistoric peoples in terms of vessel performance, energy expenditure, and cooking techniques.

Ohman, Alexis (College of William and Mary) and Jennifer Kahn (College of William and Mary)

[189] *Ichthyoarchaeological Analysis of ScMo-350 on Mo'orea, French Polynesia*

ScMo-350 is located on Mo'orea Island, northwest of Tahiti in French Polynesia. Our ichthyoarchaeological analyses assess which fish taxa were utilized by the pre-contact Ma'ohi, and how those taxa may have changed over time. Our diachronic approach investigates fishing activities over a c. 1,000 year period, between AD 900–1800. We broadly divided this beach ridge site into four excavation blocks to aid in spatial analyses of the recovered artifacts. Fish specimens were heavily concentrated in Blocks 2 and 3, correlating to areas of the site with high frequencies of fishhook

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

manufacturing blanks. This demonstrates differential areas of activity across the site. The manufacture of fishing technology (fishhooks, trolling lures, etc.) was kept separate from fish butchery, and ethnographic evidence suggests that these activities were conducted along gendered divisions of labor with men fishing and women processing those fish. However, these binary categorizations are not as starkly defined as often presented. Mo'orea had seasonal shifts in marine resource availability prompting communal fishing, activities that complicate simplistic traditional narratives. Our poster focuses on the spatial and temporal analysis of fish specimens at ScMo-350 and situates these data compared to sites on nearby islands such as Maupiti in the Leeward Society Islands.

Ojeda Rodríguez, Elizabeth (Departamento de Antropología, Georgia State University) and Jeffrey B. Glover (Departamento de Antropología, Georgia State University)

[330] *Uses of Different Species of Animals from Vista Alegre: A Zooarchaeological Analysis*

Previous zooarchaeological research has focused on knowing the patterns of wildlife exploitation in the different archaeological sites of the Maya area. In this sense, the present work intends to approach the different uses of the different species of animals in activities carried out by the pre-Hispanic Maya people located at the site of Vista Alegre, Quintana Roo, Mexico. The simple has c. 23,000 remains of fauna, coming from three architectural constructions: Structure 9 (Operation 3A), Structure 18 (Operation 3B) and Structure 13 (Operation 1), in addition to 9 off-structure test excavations located along an east/west transect across the island. These remains are analyzed from three perspectives: identification of the taxonomic, osteological and taphonomic profiles. So far, preliminary results have shown that Vista Alegre coastal residents have patterns of faunal exploitation on the northern coast of the Yucatan Peninsula that focus heavily on the use of local species, particularly marine species, similar to the sites of Champoton, Cozumel and Xcambo. This research has also demonstrated that these coastal sites were also able to gain access to inland species.

Okumura, Mercedes (National Museum, Federal University of Rio de Janeiro, Brazil) and Rafael Suárez (Facultad de Humanidades y Ciencias de la Educación)

[2] *The First Record of Tigre and Pay Paso Paleoamerican Points in Southern Brazil: Implications for the Early Holocene Settlement of South America*

The early occupation of Southeastern South America (including Uruguay and Southern Brazil) is an issue that has generated interest in American archaeology. Recent research in Uruguay indicates to the presence of two different designs of projectile points manufactured during the early settlement: Tigre (ca. 12,000–11,100 cal BP) and Pay Paso (ca 11,080–10,200 cal BP), recovered in archaeological sites with chronological and stratigraphic control in the Uruguay River. Given the potential use of such points as chronological markers, as well as the importance of a greater integration of archaeological data from Uruguay and Southern Brazil, we aimed to identify the presence of these artifacts in the Brazilian territory using a database including measurements and photos of over 3,000 prehistoric points mainly from Southern and Southeastern Brazil. Pay Paso points were found only in the Southern states (Parana, Santa Catarina, and Rio Grande do Sul), while Tigre points seem to present a much wider distribution. This work is the first attempt to record the presence of such points in archaeological sites from Southern and Southeastern Brazil, in order to better understand questions related to the mobility of human groups during the Pleistocene- Holocene boundary in Southeastern South America.

Oland, Maxine (University of Massachusetts- Amherst)

[117] *Acting, Reacting, and Entangling at the Edge of the Spanish Colony: Maya Life at Progreso Lagoon, Belize in the Context of Colonization*

The Maya of northern Belize were located at the edge of the Spanish colony, far from the Spanish capital at Merida, and visited only occasionally by encomenderos and priests. How much of Maya life then was a reaction to Spanish colonization? The archaeological data from Progreso Lagoon, Belize suggest that most contact and colonial period material culture at the Maya community was shaped by ongoing Maya political and economic processes, rather than by Spanish intervention. In addition, Maya leaders used European artifacts in ways consistent with longstanding Maya uses of foreign objects, for Maya political and economic purposes. This paper argues that concepts such as reaction, resistance, and hybridization fail to acknowledge the depth of Maya history and the role of Maya worldviews in shaping the colonial experience at Progreso Lagoon. I suggest that the concept of entanglement may better encapsulate the way Maya people continued to act in Maya ways, along their own historical timeline, even within the context of colonization.

[288] *Importation, Distribution, and Crafting of Obsidian at Formative Etlatongo*

The nature of the utilization of obsidian throughout Mesoamerica has long been a focus of study and topic of debate for many anthropologists. The history of lithic analysis has produced many assumptions and interpretations regarding exchange, use and control of this extremely important material. Obsidian itself, as an imported resource, might have had otherworldly properties that held a special place in the cosmological construction of the world for villagers in the Valley of Oaxaca. The power of higher status community members may have been channeled through these distinct and imported materials, including obsidian. The recent excavations at Etlatongo, in the Mixteca Alta, have provided an opportunity to test these models and utilize new theoretical perspectives. Samples of obsidian excavated at Etlatongo, from both domestic and public space, demonstrate long distant relationships that the village, and specific households, may have developed in order to procure obsidian. We also explore the crafting of the material itself. Etlatongo also gives us the opportunity to systematically test distribution and frequency levels throughout the site, to determine if there was any control or redistribution over certain obsidian sources, which would be indicative of the economic and other-worldly importance of obsidian at Early Formative Etlatongo.

[135] *Mitigation and Management in the Context of Climate Change at Three Historic Properties on the Great Plains, USA*

Under the terms of a Memorandum of Agreement, a professional archaeologist and land-survey crew annually visit 16 historic properties within the Area of Potential Effects of the Maple River Flood Control Dam to document site conditions. All are archaeological sites that could be subjected to seasonal temporary inundation during spring runoff and/or periodic non-winter storm events. Since the "dry dam" first became operational during spring melt in 2007, extreme flood events occurred in 2009 and 2011 resulting in slope failures and erosion at three of the sites. Mitigation measures were implemented at the 32CS0101 (Shea) and 32CS4478 (Sprunk) sites—both Plains Village Tradition hillforts listed on the National Register of Historic Places (NRHP)—and at a third site—32CS4499 (unnamed), a Woodland habitation eligible for NRHP listing. Corrective engineering actions focused on site slopes and their adjacent streambanks to reconstruct, stabilize, and revegetate the exposed and failing embankments. Initially, these mitigation measures were hampered by significant challenges within the context of climate change, namely, major spring floods in 2009 and 2011, and moderate-

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

to-severe droughts in 2012 and 2013. In subsequent years, significant progress has been made as environmental conditions have been conducive to long-term embankment stabilization.

[180] *Enhancing Access to Arabian Rock Art Archives*

Petroglyphs and inscriptions have been investigated in the Arabian Peninsula at least since 1879, when Lady Anne and Wilfrid Blunt crossed the An Nafud desert and stopped at the now famous site of Jubba in northern Saudi Arabia. Since that time explorers from England, Belgium, Germany, the US, and the Saudi Department of Antiquities, have recorded images from north to south. Archival materials, including field notes, photographs and letters are available at various institutions, but there is no central repository or website that provides information on access to these sources. Since 2013, the Arabian Rock Art Heritage website (Saudi-Archaeology.org) has presented photographs and documentation based on recent exploration.

Now, an effort is being made to expand it with a complete catalogue of photographs from this project and a resource guide to archives at other institutions. The goal is to greatly expand access to archival records for archaeologists and epigraphers around the world to enhance and advance research.

Olson, Kyle (University of Pennsylvania)

[3] *Legacy Data and Ceramic Chronologies: The Case of the Gorgan Plain, Northeastern Iran*

After the passage of the Iranian Antiquities Law of 1930, the Gorgan Plain in northeastern Iran was seen as one of the most promising regions in the Old World for archaeological research. Despite decades of pioneering field and laboratory research, northeastern Iran still lacks a regionally integrated ceramic chronology for significant stretches of its archaeological history, particularly the 3rd millennium BCE. While individual sequences from important sites such as Tureng Tepe and Shah Tepe are well known, the precise nature of their relationships to each other and to other less-well known neighboring sites have remained unclear. This lacuna in our understanding of the culture history of the region presents a major obstacle to developing models of the social, political and economic history of the Gorgan. This paper, therefore, presents the results of research aimed at constructing a regionally integrated ceramic chronology for this region, in light of the potential anthropological significance of this dataset with respect to the emergence of regional community networks and the formation of archaic complex polities. In addition, this paper reflects on important issues related to the rehabilitation of legacy data and the methods by which it may be restructured for effective quantitative analysis.

O'Mansky, Matt (Youngstown State University)

[274] *Local Legacy, Local Legend: John White, Youngstown State University, and Fifty Years of Public Archaeology*

Dr. John White served as a member of the faculty at Youngstown State University from 1971 to 2005. Part of his legacy is nearly four decades of local, regional, and public archaeology. He shared his passion for the discipline with thousands of students and engaged hundreds of students and volunteers in fieldwork, both regionally and internationally. Upon John's retirement in 2005 I was hired to take his position. In this paper, I summarize my own work and collaborations with colleagues as we have sought to extend John's legacy of education and public outreach. Toward this end, we have worked with local parks and organizations, including the Boys and Girls Club of Youngstown and Boardman Park, on a variety of archaeology programs. We also continue to engage in both local and international projects with our students, traveling to work in Guatemala, the Bahamas, and elsewhere. While John White passed much too soon in 2009, his legacy—and legend—lives on.

Omar, Lubna (Binghamton University)

[56] *Running with the Mules: Integrating Zooarchaeological, Archaeological and Textual Evidence to Reconstruct the Exploitation of Equids in Southwest Asia*

The equid had a vital role in animal economy in Southwest Asia, whether as a wild animal providing primary/secondary products to prehistoric communities, or as a domestic source of energy which supported war affairs and trade during historic periods. Reconstructing the dynamics of humans and the four-equid species, which were present in the region, is a complicated endeavor due to the paucity of skeletal evidence in faunal assemblages; the difficulties in distinguishing morphological traits to separate between the closely related species and hybrids; and the perplexing morphometric approaches to identifying equid skeletal elements. Therefore, integrating archaeological and textual evidence from the historic periods in the Near East provides an exceptional opportunity to assess the distribution of equids, and their role on economic and cultural levels. This study aims to demonstrate the available evidence of equid exploitation strategies during the Bronze Age, using zooarchaeological analyses, while enhancing our knowledge about how domestic and wild equid species were incorporated in early urban entities, through archaeological and textual representations of these animals. Compiling different lines of evidence is expected to illustrate how complex societies maintained their provisioning networks and maximized the intake of animal products within early urban cities in southwest Asia.

[206] *Collective Biographies: Ancient Maya Objects in Collections, Past and Present*

This paper explores the collecting, repositioning, and separating of ancient Maya objects, both in the ancient past and the twentieth century. Archaeological context provides evidence of ancient Maya aggregation of disparate objects in tombs, caches, or sculptural tableaux as well as evidence of repositioning or separating things. These changes are fundamental aspects of objects' life histories. Yet in the twentieth century, ancient monuments and object sets also have been divided—and new sets created—whether by national museums or research institutions seeking to trade duplicates or by players in the art market hoping to increase return by splitting paired or assembled objects. Such divisions are problematic, for new assemblages often frame modern understandings of them, and evidence for original assemblage may be difficult or impossible to reconstruct. This paper thus explores the importance of considering objects not just on their own but also in relation to other pieces to which they were connected. Thinking about biographies of objects—or collective biographies—in the past and present is a way to theorize both objects' individual trajectories and the connections and disconnections resulting from forming or splitting pairs, sets, or other groupings.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Onken, Jill (University of Arizona)**[182]** *Chacoan Outlier Depopulation and 12th Century Arroyo Cutting near Zuni Salt Lake, New Mexico*

Depopulation of Chacoan outlier settlements in the Cibola culture area near Zuni Salt Lake ~AD 1130 has been attributed to the onset of a persistent 50-year drought. Prior alluvial stratigraphy studies concluded that arroyo formation near these settlements occurred two centuries after this exodus and therefore was not a contributing factor. The present study used a larger sample of radiocarbon dates, including short-lived, charred plant material from alluvial contexts and tree-rings from several deeply buried juniper trees preserved at the base of paleoarroyo fills, to refine the dating of late prehistoric channel entrenchment in the Zuni Salt Lake area. Bayesian age modeling that included juniper germination dates determined by radiocarbon wiggle matching facilitated construction of a high-resolution alluvial chronology. The revised chronology includes an arroyo-cutting episode constrained to the 60-year interval between AD 1106 and 1166. This finding suggests that terminal Pueblo II depopulation of the Zuni Salt Lake area ~AD1130 probably did in fact coincide with extensive arroyo formation. This landscape degradation greatly reduced the area's agricultural potential and arguably played a significant role in its mid-12th century depopulation.

Opishinski, Ana (UMASS Boston)**[104]** *The Zooarchaeology of LA 20,000*

Identity is a complex entity that is constantly being remade and altered, so to understand the development of the New Mexican identity in the 17th century, one must understand the various parts that make up an identity. This poster examines one of these parts: the foodways of New Mexico. Specifically, this project is examining the faunal deposits from LA 20,000, the largest Spanish estancia in early colonial New Mexico (1598–1680). The meat-component of the diet from a 17th century Spanish colonial site in New Mexico has never been analyzed in depth, so understanding how colonists and natives conceptualized, prepared, and consumed livestock and local foods can reveal much about identities and status, and how those were affected by food availability, traditional food practices, and interactions between different social and ethnic groups. Since 17th century New Mexican foodways have been understudied, this research represents an in-depth look at how Spanish colonists and local Native Americans cultures first came together through the medium of food and how these interactions helped to develop the foundation for the New Mexican identity. Understanding the development of foodways in early colonial New Mexico will open up possibilities to explore diachronic changes in food and identity.

Ordoñez, Maria, Tamara Landivar (Museo Pumapungo) and Lourdes Torres (USFQ)**[324]** *Putting Heads Together: A Multidisciplinary Approach to the Museum Archaeology of the National Tsantsa Collection at the Pumapungo Museum, Cuenca*

There are many collections of Tsantsas around the world. These shrunken heads were created by the Shuar and Achuar peoples of the Ecuadorian and Peruvian amazon until the mid-20th century. Though most of these museum collections have a known provenience, the individual histories and the authenticity of some of the heads has been contested. Similar questions have risen for Tsantsas held at the Pumapungo Ethnographic museum in the city of Cuenca, Ecuador. Using the approach of museum archaeologies, a multidisciplinary team including archaeologists, anthropologist and biologists has worked together with members of the Ecuadorian Shuar community to address these questions. During this talk some of the initial finds of the project will be presented, including medical digital images, and the viability of ancient DNA testing on this remains.

Ore Menendez, Gabriela (Vanderbilt University) and Steven A. Wernke (Vanderbilt University)**[65]** *Using Multispectral Drone Imagery for Identification of Prehispanic Agricultural Features*

In recent years, the use of multispectral satellite imagery has become an increasingly viable option for archaeological site detection and classification. Nevertheless, the high costs and relatively low resolution of multispectral data present challenges for local-scale archaeological feature detection. In this presentation, we will examine the advantages and limitations of using UAV aerial multispectral imagery as a means of local-scale feature detection. We compare results of remote sensing classification techniques on multispectral satellite imagery (at ~ 2m resolution) and results from drone-based multispectral imagery (at sub-decimeter resolution) of the same area. We map and classify the agricultural landscape (prehispanic and early colonial agricultural terraces, canals, and paths) in a 5 square kilometer area in the region of Huarochirí of the Peruvian highlands. We evaluate the potential to use the UAV-derived multispectral imagery as a "near ground truth" source for informing the execution and interpretation of satellite imagery-based classification schema and feature detection. We also explore the utility of the combined use of UAV- and satellite-based multispectral imagery for improving the efficacy of pedestrian survey, especially in areas of high topographic relief as in the highland Andes.

Orijemie, Emuobosa**[213]** *Plant Management, Resilience and Environmental Changes in the Wetlands of Nigeria*

Palaeoenvironmental data obtained from coastal areas (wetlands) of southern Nigeria reveal three main periods of climatic changes from the Mid Holocene-Present namely (i) very wet (ca. 6,000–5,000 BP), (ii) dry (ca. 4,500–2,500 BP) and (iii) humid periods (ca. 2,500-Present). This paper explores the dynamic ways in which the culture of plant management and plant food resources in these marginal lands has been expressed within the context of environmental change. The similarities in the management techniques, names and ritual practices associated with some indigenous plants (*Elaeis guineensis* (oil palm), *Cola acuminata* (kolanuts), *Dioscorea* spp. (yams) and *Raphia hookeri* (wine palm), among several peoples in the coastal areas of Nigeria reflect significance of prehistoric social contact, networks and trade relations. The culture of exploiting "famine" and wild crops during drier periods is reminiscent of human adaptation in periods of scarcity. Despite the effects of recent climate change, as well as the rise in exotic plants, the survival of certain indigenous plants as well as their undiminished value in socio-religious practices reflects the resilience of such cultures, a phenomenon characteristic of the human species.

O'Rourke, Makaela (Utah State University, University of Oregon) and Scott Thomas (Burns Bureau of Land Management, District Archaeol)**[265]** *Pottery at Skull Creek Dunes, OR and Its Implications for Pottery Tradition in Southeastern Oregon*

Prehistoric pottery is rare in Oregon, and the presence of pottery at the Skull Creek Dunes site in Catlow Valley of Southern Oregon is potentially important. This paper builds on the previous excavation and research by Scott Thomas of the Burns BLM and describes the pottery and work done on it since. These sherds represent one of the oldest pottery traditions in Oregon, and were likely made on site. Initial dating places the site around 1250 CE. In addition to the sherds, small possible gaming pieces and fired clay cones were also discovered at the site, as well as lithic and faunal components. A discussion of possible cultural origins of this pottery is included.

Orozco, Joseph (CSULA)**[134]** *Disregarded Ritual: A Critical Reassessment of North American Subterranean Features*

This paper critically reassesses the use of subterranean features among prehistoric Native Americans of North America. A survey of the archaeological and ethnographic literature suggests that pre-historic Native Americans used subterranean features in a ritual context, although the ritual component is

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

rarely acknowledged directly. The significance of the features becomes apparent when the context, mainly construction and artifact deposition, is considered. Many of these subterranean features have been created naturally through geologic processes. However, it is significant that in areas devoid of natural subterranean features, pre-historic Native Americans constructed subterranean features to substitute for their natural counter parts. The archaeological and ethnographic literature document that ritual subterranean features are distributed throughout North America. Evidence includes ritually deposited cordage and sandals in the south and western portion of the United States, origin myths associated with Wind Cave in the Black Hills of South Dakota, and in New England where artificial subterranean features were created. When these data are compared to Mesoamerica, it becomes clear that subterranean features are an essential component of pre-historic Native American ritual practices. I propose that an Amerindian Subterranean Complex exists as part of a ritual circuit related to group origin myths.

[294] *Preserving the Ongoing Legacy of Northeast Pre-contact Archaeology*

The study of Northeast pre-contact archaeology is faced with many challenges including, but not limited to preservation and impacts on the archaeological record from centuries of development. Especially concerning is the decline in academic-based research and positions. University departments once populated with individuals dedicated to Northeastern pre-contact history have traditionally been the primary means for how practitioners of the region's archaeology reproduce themselves, now have little to offer would be students seeking graduate degrees. Given this reality, some feel the study of the pre-contact period in the Northeast is waning. Nevertheless, we argue that the ongoing legacy of Northeastern pre-contact archaeology is enduring even if no longer predominantly focused within academia. This is demonstrated by the continuing efforts by archaeologists from diverse backgrounds such as state agencies, cultural resource management, and other institutions as well as academics.

[19] *Rediscovering the San Martín Pajapan Volcano in the Gulf Coast of México: An Analysis of Its Archaeological Context*

San Martín Pajapan is one of the most important and prominent volcanos that constitute Los Tuxtlas mountain system of the Gulf Coast of México. From the Prehispanic period to the present time the San Martín Pajapan volcano has been considered a natural place of the landscape with cultural significance, which is indicated by the presence of archaeological remains on its summit. The most remarkable archaeological element of this volcano is a monumental Olmec sculpture, which iconographic attributes suggest that it could have been carved during the Preclassic period. However, most of the ceramic materials found in association with the sculpture were dated by Alfonso Medellín Zenil to the Late Classic period. The temporal difference between the Olmec sculpture and the ceramic materials points out a problematic of the archaeological context. In this paper I'll present a revision of the archaeological remains of the San Martín Pajapan volcano to solve this problem. The results of this analysis indicate that, contrary to Medellín Zenil's idea, the ceramic materials associated with the sculpture correspond to the Epi-Olmec and Protoclassic period of the Gulf Coast region.

[124] *Scaling Analysis of Prehistoric Wyoming Camp Sites—Implications for Hunter-Gatherer Social Dynamics*

Recent studies suggest many properties of human settlements vary in predictable ways with population size. These studies have shown, for example, that more populous settlements are systematically denser on average than less populous settlements in a wide range of societies. In this presentation we examine this densification effect in mobile hunting and gathering societies by analyzing a database of information for prehistoric stone circle (tipi ring) sites in the plains and intermontane basins of Wyoming, USA. We examine the relationship between total camp area and the number of bison hide tipis (reflected by surface stone rings) present at these archaeological sites. We attempt to control for a variety of factors that might condition stone circle visibility and density, including palimpsest occupations, in establishing whether these camps became denser or less dense as the number of co-campers increased. We also compare our results to those observed in a global ethnographic dataset. The latter suggest mobile hunter-gatherer societies do not take advantage of the opportunities for energized crowding that characterize more sedentary societies. Our study represents an initial attempt to determine whether this de-densification effect is also apparent in the archaeological record of mobile hunter-gatherers.

[46] *Revisiting Jahuay: An Early Horizon Maritime Site at the Topará Quebrada on the South Coast of Peru*

The littoral site of Jahuay is located at the mouth of the Topará Quebrada, between the Cañete and Chíncha Valleys on the South Coast of Peru. It is a key site for studying the Topará cultural tradition, which emerged on the South Coast during the late Early Horizon (EH)(250—1 BCE), and was the site where the Topará ceramic seriation was first documented by Edward Lanning in the mid-20th century. In 2017, we began our first season of excavations at Jahuay, with the goal of investigating EH coastal subsistence strategies as well as the sociopolitical role of the site within the larger Topará sphere. We recovered an array of materials, including ceramics, botanic remains, marine shell, faunal bone, and textile. Our initial results suggest the people occupying Jahuay during the EH primarily exploited maritime resources, but also had access to a wide array agricultural goods including squash, peanuts, beans, and cotton. Here we discuss these new results, including a reexamination of Lanning's Topará ceramic seriation, and consider their implications for future research.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Osores, Carlos and Bradley Parker (University of Utah)**[165]** *Comparing the Household Activities from Cerro la Guitarra (Zaña Valley, Peru)*

New insights from household archaeology on the north coast of Peru provide lines of evidence about the complex patterns of daily life. Also, few studies about the domestic life were carried out at the Zaña Valley. The first field season at Cerro la Guitarra, a fortified hill site with occupations from the Late Intermediate Period (1100–1400 AD) in the Zaña Valley, was very successful because it allows us to explore residential life using ceramics, architecture, and faunal analysis with the goal of explaining similarities and differences between spaces, constructive patterns, exchange, diet, and, more importantly, social differentiation. Since the comparisons inside the site, we hope to show how Cerro la Guitarra was a highly interactive community where intrinsic differences are important to understand the site as a whole.

Ossa, Alanna (SUNY Oswego)**[285]** *The Organization of Obsidian Exchange at Postclassic Sauce and Its Hinterland in Veracruz, Mexico*

I analyze residential inventories from the center of Sauce and its hinterland in combination with regional settlement data from Barbara Stark's Proyecto Arqueológico La Mixtequilla (PALM I, II) to describe the structure of exchange, production, and consumption of obsidian chipped stone during the Middle Postclassic period (AD 1200–1350) in south-central Veracruz, Mexico. Previous research on obsidian production found a spatial association with Sauce, which could support political administration of exchange, or alternatively, identify market exchange nearby. Reliance on spatially based models alone for identifying exchange mechanisms are flawed based on equifinality, in which different forms of exchange result in the same spatial pattern. Local chipped stone artifacts have further complications for interpretation: singular geological source, universal access, and potential specialized activities. No single model will identify all competing influences on residential inventories. To handle this complexity, I use the articulation of production combined with the spatial distribution and contextual information to distinguish between redistribution and market exchange. Results indicate that market exchange was the main mechanism. The largest concentrations of primary production indicators were found near Sauce, along with the highest quantities of blade parts, which suggests that political elites encouraged market exchange even if they did not direct it.

Ostahowski, Brian**[42]** *Coastal Land Loss and the Future of Louisiana's Archaeological Record*

This presentation examines the effects of land loss to the coastal archaeological record. Impacts observable at different scales (coast-wide, regional, and the individual archaeological site) demonstrate that our ability to understand Louisiana's past may be permanently altered. New directions for future research and community engagement are proposed.

Ostapkowicz, Joanna (University of Oxford)**[108]** *Mundus vult decipi: Caribbean Indigenous Art Past, Present, Future*

The 1990s, with quincenary 'celebrations' and two highly influential Taino art exhibits in Paris and New York (the epicentres of the pre-Columbian art market), heralded a seismic increase of indigenous Caribbean art forgeries. But these weren't the first indications of an emerging market: Caribbean forgeries had been circulating since at least the 1950s. The artistic heritage of the pre-Columbian Caribbean still remains largely understudied, with far smaller-scale production than seen in neighbouring regions like Mexico and Peru (with their own long-established, highly prolific forgers)—two of a number of factors that have led not only to site looting but entrepreneurial 'reinterpretations' of ancient artforms, both aimed at filling voids in private collections. These neo-artforms eventually enter museum collections, and are published in glossy catalogues as the genuine article, perpetuating the continuation of a particular forger's oeuvre, cementing it as an established, ancient 'style', and so skewing understanding of past artistic expressions and meanings. The forger's craft has become increasingly sophisticated, deceptive and profitable. This paper explores the issues of Caribbean forgeries in both private and museum collections, contrasting the covert enterprise with art openly produced by local artists taking the islands' ancient artistic heritage in new directions.

Ostapkowicz, Joanna [139] see Knaf, Alice

Ostrich, Stephanie (CITiZAN / Museum of London Archaeology)**[34]** *CITiZAN's Digital Toolkit: Citizen Scientists Recording England's At-Risk Coastal Archaeology*

England's coastal and intertidal archaeology is increasingly at risk from winds, waves, rising sea levels and winter storms exacerbated by climate change and can be revealed suddenly and disappear just as suddenly. However there is no statutorily informed intervention for this heritage outside of the national planning framework for this at-risk archaeology and so no infrastructure in place to systematically record these freshly exposed sites before the next storm potentially washes them away. CITiZAN (the Coastal and Intertidal Zone Archaeological Network) is a community archaeology and citizen science project set up in direct response to these threats which raises awareness of at-risk archaeology across England. CITiZAN teaches local volunteers to identify, survey and monitor the long-term fate of their local coastal sites. This paper will discuss the rapid digital recording tools on which CITiZAN rely to not only engage with but also mobilise wider audiences, including 3D photogrammetry, an open-access interactive website and free smartphone app to record fragile coastal and intertidal heritage and monitor changes brought about by erosion and storm damage. This enables the public to 'take responsibility' for the archaeology in their local areas and explore the effects of global climate change at a local level.

[34] *Chair***O'Sullivan, Aidan****[23]** *Experimental Archaeology and Investigating Houses in the Past*

Experimental archaeology can be defined as the reconstruction of past buildings, technologies, objects and environmental contexts, their testing and use, so as to gain a better understanding of the role of material culture in people's lives in the past. We explore ideas of craft, materiality, knowledge, skills and the use of different materials to practically test how people made, used and discarded things in the past. This paper will investigate how early medieval houses in Europe can be understood in terms of construction, use and abandonment, using experimental archaeology, historical sources and archaeological sciences.

[103] *Ghosts of Climates Past: Evaluating the Effects of Climate Change on the Foraging Ecology of Paleoindian Hunter-Gatherers in the North American Great Plains*

The environment has a strong influence on the evolutionary ecology of hunter-gatherer foraging. Studies of prehistoric hunter-gatherers have often made hypotheses regarding the effect of climate on foraging strategies, but have rarely tested those hypotheses. The absence of explicit hypothesis testing has been partly due to a dearth of operationalized paleoenvironmental variables. Although paleoenvironmental reconstructions have been abundant, particularly those based on pollen, they have mostly been qualitative descriptions. This study demonstrates the usefulness of modern paleoenvironmental reconstruction techniques to test evolutionary hypotheses about the magnitude and direction of climate on North American Paleoindian hunter-gatherers' foraging behavior. I used pollen assemblages from across the North American Great Plains and neighboring regions to reconstruct multiple paleoenvironmental variables—mean annual temperature, annual temperature seasonality, annual precipitation, and annual precipitation seasonality. Using spatio-temporal statistics, this study estimated paleoenvironmental variables during the Paleoindian period and in areas across the Great Plains. The results have important implications for the understanding of Paleoindian foraging and subsistence within the context of paleoclimatic and nutritional resource reconstruction. Specifically, this study reconciles current hypotheses regarding the influence of climate and ecological change on Paleoindian dietary strategies and discusses its potential as a mechanism driving micro-evolutionary consequences.

[299] *La Obsidiana del Sitio Guadalupe, Colón, Honduras*

El movimiento de obsidiana para el periodo Posclásico (1500- 1530d.C) en el noreste de Honduras, ha sido prácticamente desconocido para nosotros, por las pocas publicaciones científicas y naturaleza de los suelos en esta área del país, el hallazgo de este material puede considerarse poco probable, sin embargo existe un cambio marcado de la presencia de obsidiana para el periodo Posclásico. Mediante el estudio de las secuencias de producción lítica, tomando en consideración atributos tales como mediciones de filo, análisis de plataformas, y forma; podemos comenzar a comprender como este material fue utilizado en el sitio; y como se estaba desarrollando la industria de micro navajas con fuentes de procedencia del sur de Honduras.

Overholtzer, Lisa (McGill University)

[181] *Previous Material Entanglements and the Rise of the Aztec Empire*

Precisely dated household middens at the Aztec site of Xaltocan suggest that Aztec imperial matter—decorated serving vessels imported from Tenochtitlan and small spindle whorls used to produce tribute cloth, for example—often predates imperial formation and expansion by nearly a century. In this paper, I consider the analytical purchase we might get in explaining this puzzling finding by considering literature from the material turn; Khatchadourian, Bauer, Kosiba, and others have recently offered useful frameworks for the politics of nonhuman things and beings, for example. I attempt to move away from traditional understandings of the archaeological visibility of the Aztec empire, which present imperial things as passive and inert, and as consequences of imperialism, but not as consequential for it. Instead, I reconstruct the flows of matter that later came to be known as Aztec imperial, or rather, the Aztec empire's previous material entanglements. Acknowledging that objects, in their flows and in their presence, had effects that were not confined to the intentions of their makers and users, or to the moment of their production and use, I contemplate how these flows might have contributed to the later rise and rapid expansion of the Mexica.

[334] *PennDOT Highway Archaeological Survey Team: Providing Immersive CRM Work Experience to Students*

Despite there being more applicants with graduate degrees than there are jobs, the CRM industry suffers from the number of people holding graduate degrees but lacking experience conducting archaeological surveys for Section 106 compliance. Additionally, conducting archaeological surveys is cost-prohibitive and can be a burden on state agencies on projects where federal funds are not involved. These two issues in the field of compliance archaeology prompted the creation of the PennDOT Highway Archaeological Survey Team (PHAST). Through a partnership with Indiana University of Pennsylvania, each year PHAST gives 4 students an opportunity to work on and complete small Phase I and II surveys for the Pennsylvania Department of Transportation. The students gain experience in the field, and are employed in the lab to perform the necessary background research, GIS mapping, curation and documentation following the guidelines of the Pennsylvania Historical and Museum Commission. Much of this experience is outside the purview of most field technician positions. This paper will explore the successes and failures of the PHAST program from both a professional and financial point of view. How have the students benefitted from their experience within the program, and how has the state benefitted from the services provided?

[24] *Late Neolithic and Early Bronze Age Agro-Pastoral Diets at Shimao, Northern Shaanxi Province, China: Stable Carbon and Nitrogen Isotope Analysis of Human and Faunal Remains*

The late Neolithic to early Bronze Age period (ca. 2800 BC–1900 BC) in the Ordos Region, Northern China was a transitional period, that included the adoption of agro-pastoralism, as well as increasing sociopolitical complexity. Subsistence economies were shaped by a variety of strategies that included a mixed agro-pastoral system focused on millet cultivation and herding of caprines and cattle, with limited contributions from hunting and gathering of wild plants. Here in this study we report the carbon ($\delta^{13}C$), nitrogen ($\delta^{15}N$), and nitrogen amino acid isotope analyses results for the dietary reconstruction of agro-pastoralists at the Shimao site in Shaanxi Province, China. Bone collagen carbon and nitrogen isotopic results of humans and animals are used as proxies of diet and local environment, and the local food web, that may also indicate differences in herding and management practices between different domesticated species. Results demonstrate that the majority of humans and domestic pigs were fed with substantial amounts of millets or their byproducts. The domestic herbivores, sheep and cattle, showed different dietary characteristics in that the former likely were foddered with C3 plants or grazed upon the local environment, while the latter species were fed with larger amounts of C4 products.

Oyuela-Caycedo, Augusto and Florencio Delgado Espinoza (Universidad San Francisco de Quito)

[177] *From Cooking to Smelting, the Social Technology of Pyrotechnology of Earth Ovens*

The effects of earth ovens on societies is a topic that has not been considered much, mainly because of the limitation of archaeological findings. Because our research has been mainly concentrated in floodplains environments, we have been successful in recovering a large sample that allows to propose explanations on the variability of them, and the relationship that features have in understanding some basic aspects of the social characteristic of the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

societies that created them. As a study case, we compare earth ovens from excavations conducted in lowlands Ecuador, and Colombia, that range from preceramic context, early ceramic societies like San Jacinto and Valdivia, to latter furnaces developed by the Jama Coaque and Manteño of Coastal Ecuador, and Colombia's lower Magdalena societies. Within this deep time perspective, we are proposing some basic model of the environmental and social relation of ancient Pyrotechnology.

[140] *Estimating Orthoquartzite Quarry Production on the Llano Estacado*

Morrison Formation red orthoquartzite was procured, reduced, and exported as large percussion flake blanks from a late pre-contact quarry and workshop (LA21699) near Tucumcari, New Mexico. Experimental flintknapping replication of the orthoquartzite reduction technology represented at the aboriginal quarry/workshop site produced data on the average frequency of various technologically diagnostic flake types per reduction event. Comparing these experimental flake type frequencies with archaeological frequencies of the same diagnostic flake types allowed identification of large percussion flake blanks as the modal goal of workshop reduction and estimation of the number of percussion flake blanks produced at the site and the number exported. Approximately 1,700 of the 3,000 red orthoquartzite large percussion flake blanks produced were exported from LA21699 for further reduction and use elsewhere on the Llano Estacado. This replication approach to technological analysis of a quarry assemblage illustrates a method for identifying quarry production strategies and estimating the quantities of stone implements produced and exported.

[158] *Modelo de co-participación para la infraestructura de investigación en Atzompá*

El Campamento de investigación del Conjunto Monumental de Atzompá, en Oaxaca, México, fue desarrollado con la participación de fondos federales y sectores privados como la Fundación Alfredo Harp Helú Oaxaca. Este espacio, que busca rescatar la arquitectura tradicional, ha permitido la práctica de estudios especializados del patrimonio arqueológico, el resguardo de objetos y el intercambio de conocimientos con los artesanos de Santa María Atzompá que han colaborado en el taller de restauración, montado en el mismo Campamento. Aquí se presentan algunos ejemplos de co-participación y alcances de investigación logrados hasta la fecha en la infraestructura que utiliza el Proyecto Arqueológico Conjunto Monumental de Atzompá.

Pacheco Silva, Monica (Freie Universität Berlin, Excellence Cluster Topoi)

[36] *Perception and Interpretation of the Landscape in the Lienzo of Coixtlahuaca/Seler II*

The Lienzo of Coixtlahuaca II, also named Seler II, was brought by the German mesoamericanist Eduard Seler to Berlin, Germany in 1897. The 375 x 425 cm document, made in the first half of the XVI century in the city of Coixtlahuaca located in the modern state of Oaxaca, Mexico, is made of eight cotton cloths sewn together to form an enormous Lienzo. The history of Coixtlahuaca's cacicazgo, its territory and lineages, is depicted alongside their mythical origins and migrations. The document portrays, in a prehispanic pictographic language, the history intertwined with landscape, showing the perception and close relation of it to the city-state settlement and the cosmological interaction between them. This presentation proposes an interpretation of the modern geographical landscape and its ties and perception to the mythical landscape and history portrayed in the Lienzo. By interpreting the modern geography, mythical places of origin and foundation like the Chicomoztoc and the Coatepec, could be found within it thus, the landscape would fulfill the cosmological aspects needed for a settlement. The cosmology, history and landscape should be considered an integral feature of the settlement itself.

Pacheco-Forés, Sofía (Arizona State University) and María García Velasco (Universidad Nacional Autónoma de México)

[282] *Mobility, Ethnicity, and Ritual Violence in the Epiclassic Basin of Mexico*

Within Mesoamerica, ritual violence and human sacrifice have long been topics of anthropological inquiry. In this study, we investigate how the perception of social difference contributed to the selection of victims of ritual violence at an Epiclassic (600–900 CE) shrine site in the Basin of Mexico. The Epiclassic was a period of dramatic political upheaval and social reorganization. In such a volatile geopolitical climate, aspects of individuals' social identities, such as their residential histories or ethnicity, could have acted as powerful indicators of social difference that culminated in violence. We present preliminary reconstructions of the residential histories of a sample of these individuals using stable oxygen isotope analysis of bioapatite carbonate (n=73). Additionally, we examine the ethnicity of sacrificed individuals through geometric morphometric analysis of the variation in cranial modification form and extent (n=61). These multiple lines of evidence contribute to an ongoing project examining how diverse categorical identities predisposed individuals to suffer ritual violence during a period of socio-political upheaval and reorganization.

Pacifico, David (Cardinal Stritch University) and Melissa Vogel (Clemson University)

[82] *Neighborhoods and Urban Political Organization at El Purgatorio, Peru ca. AD 700–1400*

El Purgatorio was the capital city of the Casma State, occupied from AD 700 to 1400. Neighborhoods at El Purgatorio were organized around social status, which was in turn related to a number of factors including occupation, access to and control over economic and ritual resources, and possibly length of tenure at the site. Neighborhoods were distinguished from one another by their architectural and topographical qualities, and exhibit both planned and organic elements. Neighborhoods also displayed some internal diversity. The interrelation of these neighborhoods' functions and the interdependence of their residents were key elements in the political economy of the capital city, and potentially in the Casma State. Research at El Purgatorio suggests that we need to be aware of the potential for multiple sociopolitical configurations among and between neighborhoods within the same city. Those contours can help us better understand the complexity and dynamism of settlements in the Prehispanic Andes. Moreover, the findings from El Purgatorio direct us to contemplate the relationship between urban core and hinterland neighborhoods in order to fully understand Prehispanic sociopolitical integration and dynamics.

Pagan-Jimenez, Jaime R. (Faculty of Archaeology, Universiteit Leiden)

[323] *Kitchen Affairs: First Insights into the Intimacies of Food Plant Preparation at El Flaco, Northern Dominican Republic (XII–XV Centuries)*

Ongoing investigations by the Nexus 1492 Synergy Project (Leiden University) at El Flaco archaeological site, has revealed the existence of an interesting Amerindian hamlet chronologically situated between XII and XV centuries. People who lived and died there, being carriers of the Meillacoid and Chicoid traditions, kept their kitchen areas extremely close to their houses, leaving noticeable remnants of their processing tools (shell scrapers, rudimentary grinding stones), cooking pots and griddles (made from stone and clay), serving implements (plates, bowls and ceramic bottles) and a key "crushing" tool used during food intake: human teeth. Residue samples from these plant-handling tools, recovered in one of the identified kitchens, has been subjected to ancient starch grain analysis aiming at knowing which were the main starchy plants prepared at these kitchens. Phytolith analysis

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

was also done in soil samples from these areas to retrieve potentially important microbotanical remains from plants that are typically unnoticeable to other research techniques. This preliminary report present results from both analyses by discussing first some methodological issues on starch and phytolith studies in such contexts and offering later the first interpretations of the phytocultural dynamics attached to these spaces of identity expression.

[227] *Was Acheulean Technology Genetically Transmitted? Comparing Variation in Acheulean Tools to Variation in North American Bird Nests*
Acheulean large cutting tools were made across Africa and Eurasia for ~1.5 million years, and show surprisingly little variation for a technology so spatiotemporally vast. One explanation for this puzzling degree of conservatism is that Acheulean tools were not culturally transmitted but rather genetically determined. If this hypothesis is true, then Acheulean tools are more akin to animal technologies such as bird nests than to modern human tools. Here we examine the extent to which the variation in Acheulean tools compares to the variation among bird nests of North American passerines. We compare measurements of Acheulean tools (N = 3,526) to measurements among simulated, time-averaged nest assemblages derived from observations across North America (N = 2,544). We discuss the results, as well as the potential of natural experiments, such as the evolution of bird nests, in exploring difficult problems in lithic analysis.

Pailles, Matthew (University of Oklahoma)

[131] *What's Really Important in the Ethnohistory of Sonora?*

Analysis of Contact Era ethno-historical accounts has played an outsized role in the interpretation of protohistoric Sonora, Mexico. Controversy surrounds interpretations, owing to incongruities between archaeological and textual data as well as disagreements over how to weight the disparate observations made in these documents. Modern researchers variably evaluate the biases, motives, and the overall truthfulness of the authors of these documents. Another issue is the general subjectivity involved in fitting non-systematic observations into pre-existing anthropological models; usually some support can be found for almost any position. This presentation will attempt to address some of these issues by applying a formulaic approach to the weighting of document subject matter. While there is still subjectivity involved in the method, it provides a consistent and replicable means of evaluating the importance of different themes in a text. These themes can then be interpreted to infer both biases of the author and the relative significance of observations regarding Indigenous social organization. A trial attempt at this approach supports many pre-existing interpretations but also suggests some of the topics previously identified as paramount in the social organization of Contact era Sonora are of secondary importance.

[18] *Issues Reconstructing the Ancient Population of El Mirador, Guatemala*

El Mirador, in the northern Peten, has redefined our ideas about the Maya Preclassic. Its massive architecture and its complex system of sacbes compare to the largest Classic period centers. Unlike many of its smaller Preclassic neighbors, El Mirador collapsed at the dawn of the Classic. Understanding El Mirador's organization, economy, and relationship to its environment requires detailed knowledge of the site's population trajectory. Reconstructing El Mirador's population trajectory, we face a series of issues: definition of site boundaries, visibility of above-ground structures, identification and counting of residential groups, the presence of hidden or invisible structures, dating residential groups, and populating residential groups. LiDAR images are analyzed to identify groups and define the sample universe. A sample of residential groups is defined for ground truthing a testing in the field, based on ecological factors, local settlement patterns, and socioeconomic estimates based on surface remains. We discuss sampling issues, the use of LiDAR, issues of accounting for hidden structures, and the combined use of ethnographic analogues and modeling to populate ancient structures, and how each affects population estimates for El Mirador.

[66] *Maya Ossuaries: Body Processing and Collective Memory in the Terminal Classic*

The allocation of space for the deceased is an integral component of understanding the relationship between a community and its mortuary practices. This paper explores how Maya ossuaries, or deposits with the commingled remains of multiple individuals, form a distinct body processing method that increases in frequency during the Terminal and Postclassic period in the Northern Maya lowlands. Data from salvage excavations of a Terminal Classic disturbed ossuary in the archaeological zone of Yaxuná in central Yucatan are compared with ossuary deposits at Chichén Itzá, 20km to the north. Along with population decline at Yaxuná during Chichén's rise to power came a number of new cultural practices associated with the larger mega-site. New funerary practices including an ossuary with numerous fragmented human remains as well as urn burials signal profound cultural changes during this time. This research illuminates how ossuaries are integral to the history of this region by providing spaces for collective memory and enhancing the relationship between space, the body, and community within Maya society.

[282] *Iron Age Trade and Mobility: Assessing Migration at the Site of Ban Pong Manao, Central Thailand*

The archaeological site of Ban Pong Manao is located in the highlands of central Thailand with mortuary contexts dating to the late Iron Age (300–400 CE). Most individuals were buried with numerous grave goods, including intentionally broken ceramics and ritually bent metal implements, and some graves included imported metal, glass, stone, and shell artifacts. The presence of non-local artifacts implies interregional interaction and may indicate

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

some degree of social inequality, but the scale, nature, and expression of these relationships remains unclear. This study uses radiogenic strontium isotope analysis to assess the migration histories of Iron Age inhabitants of Ban Pong Manao. First molar enamel samples from 32 adults were analyzed to distinguish between local and non-local individuals within the burial population. The results contribute to ongoing debates regarding the social significance of imported artifact inclusions in ancient Thai mortuary contexts—whether they signal high social status (prestige goods), the nonlocal origin of the deceased (reflection of social identity), or evidence communal aspects of memory and mourning. Results from this study further

contextualize the changing social, material, and lived experiences of Iron Age inhabitants at Ban Pong Manao through a clearer understanding of migration, social identity, inclusion, and belonging.

[18] *Underwater Archaeological Survey of Freshwater Lagoons in the Lacanja Basin, Chiapas, Mexico*

The intrinsic relationship between human beings and bodies of water is unquestionable. Among the ancient Maya it has been observed that many of their agricultural cults were linked to existing bodies of water where they settled. In the Maya Northern Lowlands, multiple underwater archaeological studies of cenotes record this behavior as offerings of luxury items and human sacrifice are often recovered and noted. The Rancho Ojo de Agua archaeological project focuses on the basin of the Lacanja River. In the preliminary year of study, ethnographic evidence suggests that on May 3 every year, the current indigenous Maya groups of the region conduct pilgrimages to neighboring bodies of water to assure assistance for a prosperous agriculture season. Underwater archaeological surveys including dive-line and circular survey of three lagoons, Sanctuary of the Crocodiles, Laguna Ramón Cruz and Laguna Sibal, in the basin of Lacanja river in the Maya Southern Lowlands were conducted by the Rancho Ojo de Agua archaeological project to understand the relationship of these bodies of water to early Maya settlement. The initial discoveries made in three bodies of water will be presented.

[261] *Addressing Today's Issues with Yesterday's Tools*

Dakota Access Pipeline. Ruby Pipeline. Ocotillo Wind Energy Facility. Topock Natural Gas Compressor Station. These are just a few examples of projects where the National Historic Preservation Act (NHPA) failed to protect cultural resources deemed significant by Native American tribes. In these instances, why did NHPA fail? Largely because NHPA does not consider impacts to the complete suite of cultural resources. It only addresses historic properties and historic properties "of traditional religious and cultural significance". This narrow focus makes NHPA a less-than-perfect tool to deal with cultural resources when it comes to today's current issues and concerns. Is there an alternative? For years, experts suggest that the National Environmental Policy Act (NEPA) is better equipped to protect a wider range of cultural resources. In this presentation, I highlight several court cases where NEPA has successfully protected cultural resources when NHPA has failed to do so under similar circumstances. This ultimately shows the broad strokes of NEPA are a stronger tool for preserving cultural resources today rather than the limiting paintbrush of NHPA.

[180] *Documentation, Methodology and Interpretation of Rock Art from Castle Rock Community, Canyons of the Ancients National Monument, Colorado*

Thirteenth century A.D. in the central Mesa Verde region was a time of socio-cultural transformations, climatic changes, and increasing conflicts and violence that took place shortly before the final depopulation of the region. Since 2011 the Sand Canyon-Castle Rock Community Archaeological Project is being conducted and it focuses on the analysis and reconstruction of the settlement and social structure in a community of forty Ancient Pueblo sites dated to the thirteenth century. The project research area encompasses several canyons of the Canyons of the Ancients National Monument, southwestern Colorado. This paper presents some results of the project work with a focus on the methodology of recording the rock art, both using traditional and modern techniques of documentation, such as photogrammetry and 3D scanning, as well as initial analysis and interpretations. It includes Ancient Pueblo or Fremont rock art showing anthropomorphic figures and later Pueblo petroglyphs connected, for example, with violence or possibly astronomy. The rock art from the project research area is also represented by huge panels with historic Ute and Navajo petroglyphs depicting clans' symbols, fighting warriors and hunting scenes, and also by "modern graffiti" or vandalism, like initials, names and dates from the nineteenth and early twentieth century.

Paludan-Müller, Carsten (NIKU, Norwegian Institute of Cultural Heritage Research)

[63] *Conflict and Heritage*

During recent years cultural heritage has moved into public awareness as part of contemporary conflicts. Destructions of sites and monuments in The Middle East and North Africa, and in the former Yugoslavia have given us blatant examples also of targeted destruction. However this is nothing new. Throughout history monuments and heritage have played their part in conflict between people. A recent conflict in the United States over monuments relating to the Civil War and its aftermath has further highlighted the importance of heritage as an active factor in how we understand ourselves and others in the stream of history.

But in order to fully appreciate what we are dealing with in the interplay of heritage and conflict, we need to understand that conflicts themselves are part of our cultural heritage. Conflicts that sometimes reach even far back into history is a living heritage with both tangible and intangible properties. They condition our contemporary interactions with "the other" and contemporary politics. The paper proposes approaches to understanding and dealing with the complex connections between heritage and conflict.

Palus, Emily (Bureau of Land Management)

[261] *Severed from the Landscape: Wrangling Over 100 Years of Collections from the Public Lands and Coordinating Repatriation*
The Bureau of Land Management's (BLM) cultural resource responsibilities expand beyond the landscape, to the artifacts recovered from archaeological sites, and the associated records. These "gatherings" under the Antiquities Act and "archaeological resources" under the Archaeological Resources Protection Act (ARPA) were collected in the public interest to be preserved in museums for future generations. Some of these collections may also be sacred and sensitive to descendant communities, and the Native American Graves Protection and Repatriation Act (NAGPRA) directs a pathway to return ancestors and cultural property to Indian tribes. Over a century of collecting from the public lands, some under a permit, some without, has left a legacy for the BLM to "manage" millions of items that were dispersed to more than 150 museums and universities. The well-intentioned goals of the Antiquities Act, National Historic Preservation Act, and ARPA place important responsibilities on Federal agencies to be stewards of this heritage, and under NAGPRA, to be agents to uphold tribal rights and facilitate repatriation. This paper illustrates through recent examples the complex challenges in implementing these statutes, navigating occasionally absurd scenarios, and the critical need for partnership with repositories and engagement within the discipline to care for this shared legacy.

Pan, Yan (Department of Cultural Heritage and Museology, Fudan University)

[284] *A New Hypothetical Framework of Understanding the Evolution of Agriculture in the Lower Yangzi Region*
Although a number of studies in recent years have contributed fresh knowledge to our understanding of the origins and development of agriculture in the Lower Yangzi, updated data have made this issue even more complicated. The empirical evidence shows very little information about any hunter-gatherers who might have lived in this area and indicates that, 10,000 years ago, humans first appeared here as successful resource managers or niche constructors. The human ecosystem characterized by wetland management had already become quite stable by 8,000 BP. How did such a system form? And where did it come from? Is the Kuahuqiao Culture truly the descendant of Shangshan or an independent culture that had come from the continental shelf that is submerged by the ocean now? Are the similarities in the subsistence patterns of Kuahuqiao and Hemudu caused by direct heritage or coincidental cultural choice? Here I intend to propose a new hypothetical framework that differs from the Chinese traditional cultural evolutionary view to explore these issues in light of cultural niche construction theory.

Panahipour, Mitra (University of Arkansas)

[71] *Patterns of Land-Use and Political Administration beyond the Core Areas of the Sasanian Empire*
The landscapes of the Sasanian Empire have long been viewed as massive and state-sponsored development projects, in particular in politically and economically core zones. Despite these unparalleled understandings, our knowledge of peripheries and their connection with the sociopolitical organization of the time have still remained as some of the key gaps in the studies of late antiquity. To address these questions, I examine the settlement expansion, water management systems and agricultural intensification along the Sirwan/Diyala River in the Kurdistan Region. With the application of satellite images for landscape classification, GIS-based hydrological modeling, proxy records to reconstruct the climatic conditions, and combined with results of archaeological fieldwork, this paper offers that a bottom-up approach to intensification will shed new light on the role of local communities and the degree of their autonomy. It presents that large-scale projects and dependence on the centralized political authority were not always agriculturally required and a different intensification strategy with the integration of both irrigation and rain-fed practices could sustain a growing population. I further discuss the great potential of this research as a case study to unravel the role of peripheries in broader socio-political and economic transformations during the Sasanian period.

Panich, Lee (Santa Clara University) and Tsim Schneider (University of California, Santa Cruz)

[327] *Peopling the Post-contact Landscape in Central California: A Pragmatic Approach*
A cornerstone of recent pragmatic approaches to archaeology is the notion that our efforts can be judged by their practical outcomes. This may take the form of illuminating historical silences, and for those archaeologists working in post-contact or colonial contexts this often means working with indigenous groups seeking governmental or popular recognition. In this paper, we explore our collaborative efforts to discover and characterize archaeological sites dating to the early historic era in the territory of Coast Miwok and Southern Pomo people in central California. Approved by the Federated Indians of Graton Rancheria, this research is explicitly designed to counter prevailing misunderstandings about the impacts of the Spanish mission system and subsequent iterations of settler colonialism, which are usually viewed as projects that eliminated native landholdings and cultural knowledge. Through the use of historic documents, early maps, ethnographic data, and targeted archaeological fieldwork, we are illuminating a complex refugium along Tomales Bay that sustained native people during the first century after the arrival of Europeans to the region. We will discuss the challenges and opportunities of our research in light of the emerging concern for pragmatism in archaeology.

[142] *Social Complexity of Peripheral Settlements on the Regional Capital of Ichkaantijoo*
In the last decade, research done by "Proyecto Arqueológico Region de Merida" (PARME) on peripheral settlements of the Ichkaantijoo area has had as a main objective to recognize and interpret the social organization of these ancient communities, that according to literature have been defined as rural settlements. Therefore, how is this area and the sites that constitute it characterized? What role did they play in the political and economic system? And, which cultural elements have witnessed them?
Multidisciplinary research, including the pattern of settlement, architecture, analysis of diverse cultural material and funerary context, lead to think that these Mayan communities were autonomously organized, showing their very complex and enduring politic, social and economic organization.

[219] *Evaluating the Impact of Climatic and Environmental Conditions on AMH Initial Dispersal into Western Europe*
Paleoenvironmental reconstruction is an important tool for evaluating and understanding interactions between human populations and their environment during Prehistory. The downscaled global paleoclimatic models produced by the multidisciplinary efforts of the Hominins Dispersal Research Group allow for a fine-scale examination of climatic conditions in Paleolithic Europe. These models enable a spatial accuracy of 15 x 15 km and the consideration of inter-annual variability for different climatic variables. Using these data, an exploration of the MIS3 archaeological deposits and their environmental and climatic conditions is in progress. This project's goal is to evaluate the influence of climate change and variability on AMH spatial organization and test proposed routes of AMH dispersal into Western Europe. The ongoing creation of a database for early Aurignacian sites

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

which is based on a critical analysis of archaeological dates will be presented. This database will be used to process paleoclimatic models and carry out micro-regional analysis within the putative paths of AMH dispersion.

[245] *Peeling Back the 'Overburden': Collaborative Projects Studying Middle Bronze Age Societies in the Körös-Region, Southeast Hungary*

The transition to the Middle Bronze Age in the Carpathian Basin encompassed a broad range of changes in material culture, settlement and social organization. Upon first glance, the Körös-Region was no different from its neighbours. Tell sites emerged, population increased, farming intensified, and people engaged in long distance trade. The international Bronze Age Körös Off-Tell Archaeology (BAKOTA) project has studied this area through settlements and mortuary archaeology for over 11 years. Our research reveals that despite expectations, the Körös-Region followed a path quite different from its neighbours during the Middle Bronze Age: it did not experience the emergence of social inequality typical of societies just dozens of kilometers away. In this paper, we address how collaboration between North-American and European researchers shaped our questions, and how our project culture and language—"Hunglish"—have built on the successes and legacy of the Körös Regional Archaeological Project. We highlight our process of discovery, our continued interaction with KRAP, and the unexpected lessons to come from the deposits that superimpose the Copper Age layers.

Pargeter, Justin (Emory University) and Marika Low (University of Wollongong)

[41] *Lithic Miniaturization and Behavioral Variability in Southernmost Africa 18–11 kcal. BP*

Lithic miniaturization, the systematic production of small stone artifacts by controlled fracture, was a pervasive feature of late Pleistocene lithic technology. Smaller toolkits enabled humans to exploit raw materials more efficiently, to produce composite tools more effectively, to reduce a wider range of rocks, and to increase mobility by lightening toolkits. These benefits allowed humans to occupy a wider range of ecological niches. Archaeologists working in southern Africa have long acknowledged lithic miniaturization's importance in framing the region's late Pleistocene prehistory. However, to date archaeologists have conducted very little inter-region comparative research on the topic. This paper presents the results of a comparative lithic technological study between Klipfonteinrand and Sehonghong- two large rock-shelters located in southern Africa's winter and summer rainfall zones respectively. Evidence from these sites shows not only a comparative technological approach's effectiveness but also that lithic miniaturization expresses itself differently in different regions. Patterned variability of this nature fits a model of strategic behavioral variability. To gauge variability in prehistoric lithic miniaturization, archaeologists need to adopt more contextual and comparative methods of stone tool analysis.

Parish, Ryan (University of Memphis) and Brad Koldehoff (Illinois Department of Transportation)

[140] *Documenting the Crescent Hills Quarry Complex, Missouri*

Presently, no detailed distribution map of the full scope of prehistoric procurement activities in the Crescent Hills area exists. The Crescent Hills area near St. Louis, Missouri is synonymous with high-quality Burlington chert. This paper presents data gathered from a preliminary survey of procurement activity preserved in the Tyson Research Center. The spatial data within a Geographic Information System allows researchers to study the relationship between geologic context, occurrence, and prehistoric industry. Future research will build upon the initial survey data by investigating adjacent potential procurement areas. Additional studies will assess the spectral variation of the deposits and examining synchronic and diachronic use of Burlington chert at associated workshop sites.

Parker, Ashley, Lisa Johnson (University of Utah), Kate Magargal (University of Utah), Marianna Di Paolo (University of Utah) and Brian Coddling (University of Utah)

[36] *When Is a Horse Not a Horse? It Depends on Your Local Ecology*

The (re)introduction of the horse to North America brought dramatic changes to American Indians. However, not all populations were affected equally; the horse became central to some societies, but had seemingly little effect on others. This variation is seen across Great Basin ethnographic groups, where some populations adopted the horse for transportation and hunting, while others ignored or even ate the horse. Some argue that this variation is the result of environmental constraints: where the local ecology could support horses, people adopted them; where horses could not survive, people did not. Here, we propose a novel ecological hypothesis based on the costs and benefits of riding versus eating the horse. We review the historical and linguistic evidence for variation in the adoption of the horse throughout the Great Basin, and then test the proposed environmental and ecological hypotheses.

Parker, Bradley (University of Utah) and Gabriel Prieto (Universidad Nacional de Trujillo)

[165] *Microartifact Analysis: An Application at Pampa La Cruz, Huanchaco, Peru*

For decades archaeologists have been trying to develop methodologies that will help them determine what activities took place in and around ancient structures. Since people tend to clean activity areas, especially those that are used repeatedly, visible artifacts are rarely discovered in the context where they were originally used. Microartifact analysis focuses on the tiny fragments (<1 cm) of ceramics, bone, lithics, shell and other microartifacts that are produced as a result of human action. These tiny fragments are much more likely to remain in or near the context where they were originally produced because they are too small to be easily gathered and are often trampled into the soil matrixes of ancient surfaces. This study applies microartifactual sampling, processing and analytical techniques to characterize and compare the activities that took place on ancient surfaces at the site of Pampa la Cruz in Huanchaco, Peru. By examining the ubiquity of various microartifact categories per liter of excavated surface matrix, we isolate loci of food production, suggest which types of local and non-local foods were consumed, theorize about cooking practice and waste disposal, and examine traffic patterns in and around two Gallinazo structures.

Parker, David

[274] *Beer, Bologna, and Beaux-Esprits: A Legacy of John R. White*

This paper discusses the public engagement of the late Dr. John R White through stories, observations, and news media. White, who passed away in 2009, had been an archaeologist at Youngstown State University, where he led excavations, gave interviews, and presented the past since 1971. For many residents of the Mahoning Valley, White was a fixture, often teaching archaeology to his students, then later their children, and finally the grandchildren over the course of four decades. Not content to teach only in the classroom, White led excavations from early spring until the late autumn to tell a variety of histories throughout the Mahoning Valley. Additionally, White organized trips to many of the region's important archaeological sites, such as the earthworks of the Ohio Valley, blast furnaces of Western Pennsylvania, and several international destinations. Moreover, this paper

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

focuses on the many newspaper, radio, and television reports to demonstrate the passion White had for informing the public about the recent and distant past. Finally, this paper discusses the lasting legacy of White's long-term public engagement.

Parker, Evan (Tulane University)

[162] *Middle Preclassic Greenstone Caches from Paso del Macho, Yucatan*

Complex ritual deposits dating to the Middle Preclassic period are rarely encountered in Yucatan, and typically have only been recovered from disturbed contexts. Excavations along the center axes in the plaza of the Middle Preclassic village of Paso del Macho in the Puuc region of Yucatan

have yielded a series of offerings spanning from the early Middle Preclassic to the cusp of the Late Preclassic. Three different floor sequences were each associated with several offerings. The forms of the nine pottery vessels recovered from the cache are quite unique compared to types normally encountered in Middle Preclassic contexts from the Puuc region. These include a bucket, miniature bowls and dishes, and cacao serving vessels. Several of these vessels contained large greenstone axes and basalt, while another contained a perforated greenstone plaque. Upon reaching sterile soil, a massive pile of basalt fragments was found, under which three large east-oriented greenstone axes were recovered. This greenstone cache bears strong resemblance to other Middle Preclassic place-making deposits from the Maya lowlands, including Ceibal, Cahal Pech, and Cival. Its presence indicates the Northern Lowlands were embedded in the same expansive Mesoamerican trade networks as elsewhere in the Maya world.

[256] *Sacred Landscapes, Spaces, and Ritual Offerings as the Materialization of Environmental Narratives at the Site of Pacbitun, Belize*

Material culture studies allow archaeologists to examine the social implications of the physical world in which people are embedded. Sacred landscapes, for example, inspire social narratives regarding how people should interact with the environment. Components of those landscapes, such as caves and mountains, become active participants in the establishment, maintenance, and mobilization of environmental narratives. They serve as hegemonic tools for conveying morality and proper behavior, and as such they are prone to appropriation by those in power. Using archaeological data from the Maya site of Pacbitun, this paper seeks to understand how materialized narratives are part of broader networks of power used to reinforce and challenge dominant hegemony. The presence of elite-sponsored constructions near caves act as overt manifestations of environmental narratives seeking to situate the community as a unified whole. Yet, studying ritually deposited offerings in Pacbitun's caves reveals differences in ceremonial practice. These deposits inform about the day to day concerns of individuals, their socioeconomic status and differential access to power.

[245] *The Körös Regional Archaeological Project, 20 Years of (Mostly Successful) Collaboration*

The Körös Regional Archaeological Project was established in 1998 as a collaborative, multidisciplinary, research project focused on the later prehistory of the Körös region on the Great Hungarian Plain in the Carpathian Basin. Over the last two decades, the project has attempted to build upon the success of previous ambitious projects in the region by emphasizing not only the collaborative nature of the research endeavor but also by incorporating a robust training component into the project. In this paper, we attempt to review, critically, our research at Neolithic and Copper Age sites in the region, with an eye towards what has been successful and what could have been improved. We also discuss our current research, which attempts an explicit comparison of the trajectories toward settlement nucleation and tell formation during the Neolithic and the Bronze Age.

[337] *Middens, Caches, and Burials: Contextualizing the Ceramic Assemblage of La Corona*

Mundane utilitarian ware, finely decorated polychromes, fine paste and epigraphic imports, and plates bearing idiosyncratic local designs characterize La Corona's ceramic assemblage. The ceramic chronology of La Corona is presented with emphasis on construction phases, middens, caches, burials, and special deposits in an effort to reconcile the ceramic assemblage and the political history of the site. Polychromes bearing place names highlight La Corona's elite regional relationships while the prevalence of Lowland utilitarian ceramic types regionally contextualizes the nonelite. This paper seeks to situate the ceramic assemblage of La Corona within its chronological, regional, political, and social contexts.

[3] *Paleodietary Analysis of Xiongnu Individuals in Zuunkhangai, Mongolia*

The archaeology of the Xiongnu period has grown considerably over the last decade, yet debate still surrounds Xiongnu subsistence practices and the timing for the rise, expansion, and 'collapse' of the Xiongnu polity. The problem, in part, has to do with discrepancies between dates that come from the same sites. Some dates have been reported to be earlier when the samples came from human remains. These discrepancies have been attributed to the 'reservoir effect'. In order to investigate this, we analyzed and dated both human and animal remains from three Xiongnu period 'ring' burials in northwestern Mongolia—the so-called periphery of the Xiongnu Empire. Given this region has many lakes and that isotopically "heavy" $\delta^{13}\text{C}$ -values have been detected in cases from other regions of Mongolia, it is possible that fishing played a more important role than previously thought in the subsistence economy of some Xiongnu period pastoralists. Accordingly, paleodietary reconstructions based on dental pathology and stable carbon and nitrogen isotopic analyzes were also examined to evaluate how broad the dietary resources might have been and whether these individuals subsisted mainly on terrestrial animals or if fish made up an important enough source of food as to affect ^{14}C dates.

[302] *An Analysis of Bark Beaters from the Postclassic Site of Mayapán*

This project examines an assemblage of 37 bark beaters from Northwest Yucatán, principally from the Postclassic Maya site of Mayapán. Bark beaters are stone tools used in the production of bark paper. In Mesoamerica, these tools were important in several specialized craft industries, including the manufacture of codices and clothing for religious and political ceremonies. There is still much that is unknown about pre-Columbian bark paper production, as bark paper rarely survives in the archaeological record, and bark beaters are often the only remaining physical evidence indicating that

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

the production of bark paper took place at a site. Ethnohistoric sources suggest that the Postclassic Maya site of Mayapán was an important religious center that supplied priests from surrounding provincial capitals with codices made of bark paper. This study examines the degree of standardization of bark beaters, along with potential distinctions in use based on form and ethnohistorical information. The findings suggest that bark beaters were fabricated in a standardized manner, with two distinctly identifiable forms. In addition, bark beaters were also utilized for tasks other than the production of bark paper, such as smoothing plaster.

Parsons, Timothy (Florida Division of Historical Resources)

[245] *Reinventing the Wheel: Discovering the Late Copper Age in Hungary, Again*

At about 3500 BC, a seemingly intrusive population of burial mound (kurgan) builders undertook a long-term series of migrations that resulted in the disruption of settlement patterns and social structures throughout eastern and central Europe. This phenomenon coincided with the emergence of the expansive and geographically homogeneous Baden material culture. From the 1960s to the 1990s, a series of archaeologists investigated the relationship between kurgan builders and Baden in the Carpathian Basin at various geographic scales. They questioned whether the Baden tradition was adopted by indigenous populations, if the tradition arrived with people via migration, and what role, if any, kurgan builders played in the emergence of Baden. The research presented in this paper is a reassessment and continuation of work done by researchers such as Maria Gimbutas and Andrew Sherratt, developed within the context of long-term, international, collaborative projects that address broad anthropological and archaeological issues related to social organization and hereditary inequality. Ultimately, I conclude that the shift in material cultural witnessed during the Late Copper Age on the Great Hungarian Plain is consistent with models of social change developed by other presenters in this session.

[285] *Obsidian Processing and Distribution in Classic Period Lower Cotaxtla Basin, Veracruz, México*

During the Classic period (1st mill. CE), South Central Veracruz was a mosaic of microstates in which obsidian was scarce but available to everyone. Semi-intensive systematic survey in 400 km² of the lower Cotaxtla basin showed occasional concentrations that led to propose two alternatives: state-controlled workshops obtaining and redistributing artifacts to resident population, or independent workshops servicing clients across borders, implying the existence of a market-based economy.

Chaîne opératoire analysis shows that, while obsidian sources (Zaragoza-Oyameles for prismatic blades and Pico de Orizaba for percussion flakes), core types and knapping techniques are identical across the survey region, there is a high incidence and a wide variety of knapping errors. The evidence reflects a well-established procurement system coupled to a low degree of specialization, which opens the possibility of a third alternative: state procurement of raw material (acquired using surplus of commercial staple like cotton, cacao, or rubber), with limited individual household access and production of artifacts.

[177] *Reconstruction of Pyrotechnology Connected with the Earliest Pottery. Micromorphology and -FTIR at Xianrendong and Yuchanyan, South China*

The sites of Xianrendong (Jiangxi) and Yuchanyan (Hunan), China, contain the earliest pottery yet discovered, dating respectively 20,000 cal BP and 18,600 cal BP. This pottery is found in otherwise Late Paleolithic, hunter-gatherer contexts. To understand human activities at these caves we employed micromorphology and -FTIR on the sediments. Here we present the results of analysis of the layers containing combustion episodes, which suggest low heating temperatures at both sites, and infer different kinds of activities in the caves. The low temperatures evident at Xianrendong raise new questions regarding cooking methods and pottery-making techniques. Thoroughly consumed wood fuel and presence of prepared clay surfaces at Yuchanyan indicate sophisticated pyrotechnological knowledge. These results are a first step in generating a high-resolution account of life in these two sites.

[121] *Ceramic Technological and Stylistic Boundaries on the Indus Frontier of Gujarat*

Rita Wright's pioneering work on the ceramic stylistic and technological traditions of the Indo-Iranian borderlands highlighted the potential of new theoretical approaches to our understanding of cultural boundaries within South Asia. This work highlighted the complex nature of technology and style boundaries within specific contexts of cultural interaction. This paper takes inspiration from Dr. Wright's work and applies this framework to another frontier of the Indus: the northwestern state of Gujarat. At the time of the Harappan occupation of this region (4th to 2nd millennia BCE), Gujarat was home to a number of localized ceramic traditions. Overtime, this area came to represent a mix of both traditional cultural expressions of Harappan stylistic norms as well as regional appropriations and adaptations of Harappan ceramic style and technology. This unique cultural landscape developed as a result of different forms of cultural processes, whether it be emulation, knowledge transfer, or shared aesthetics. By comparing the technology and styles of local ceramic traditions with that of the Harappans it is possible to trace one aspect of social interaction within this area.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Patterson, Erin (Tulane University)**[337]** *The Bioarchaeology of La Corona, Guatemala*

Analysis of human skeletal remains has made significant contributions to the understanding of the history of La Corona and its interaction with the wider Maya world. The skeletal sample has now grown to include nearly thirty individuals, and includes single and multiples burials, non-burial deposits, and individuals from the site center and outlying sites. The study, one of the most comprehensive in northwest Peten, has focused on establishing demographic information and examining osteological indicators of diet and health, especially dental pathologies like caries, calculus, antemortem tooth loss, and linear enamel hypoplasia. Through the analysis of human bone, this paper will explore how factors like sex and social status are correlated with health and diet at La Corona. These data help situate La Corona within a broader regional context.

Patterson, Erin [337] see Ponce, Jocelyne

Patton, Katherine (University of Toronto), Susan Blair (University of New Brunswick) and Ramona Nicholas (University of New Brunswick)**[199]** *Recent Insights into Protohistoric Foodways in the Northern Quoddy Region of the Northeast*

Despite more than a century of archaeological research in the Quoddy Region of southwestern New Brunswick, in the Canadian Maritime Provinces, the protohistoric and early contact periods in this area have remained obscure. However, recent research at several sites has begun to illuminate this period, and like many of the precedent Woodland period sites (prior to 500 BP), many of these newly studied protohistoric sites have produced shell-bearing components, and contain a wealth of information on the integration of foodways and settlement, including site intensity and season of habitation. In this paper, we report on recent research at one of these sites, BgDs25, located along the northern mainland of the Quoddy Region, integrating an analysis of faunal remains as a means of gaining insight into Pestomakati food and lifeways, and to add to a growing body of primary research.

Pavlik, Bruce [86] see Louderback, Lisbeth

Pawlowicz, Matthew (Virginia Commonwealth University)**[210]** *Capturing People on the Move: Spatial Analysis and Remote Sensing in the Bantu Mobility Project, Basanga, Zambia*

From its inception in 2014, the Bantu Mobility Project has sought to recover the various mobilities that made up peoples' experience of the Bantu Expansions, the spread of over 500 related languages across nearly half the African continent. We have sought to refocus research on the Bantu Expansions away from the macro-scale and onto the specific movements of people, animals, and material goods at various spatial and temporal scales. From an archaeological standpoint this effort necessitates careful study of the spatial contexts of recovered artifacts—and of the human activities that left them behind—to capture different forms of mobility. Analysis of spatial data from archaeological and geoarchaeological surveys using GIS has already illustrated important relationships between different kinds of sites in the region around Basanga, Zambia, with implications for the kinds of daily, seasonal, and long-term movements that connected the people living and working in those places. Similarly, using GIS to combine such data with that available from satellite imagery has enabled the creation of a predictive model for the location of other sites, and which concerns from a mobile, Bantu-speaking community might have driven those selections, that can be evaluated through remote sensing and further survey.

Pay, Nicholas (Bureau of Land Management), C. Cliff Creger (Nevada Department of Transportation) and Beth P. Smith (Nevada Department of Transportation)**[261]** *The Long and Winding Road: Documenting Historic Transportation Routes*

One tough issue facing federal agencies in the United States and their archaeologists is how to document historic era transportation routes. In Nevada alone, there are nearly 6,000 miles of roads managed by the Nevada Department of Transportation (NDOT) most of which follow, cross or parallel historic routes. The Bureau of Land Management (BLM) manages nearly 48 million acres (~75,000 sq miles) of land in the state of Nevada with several thousands of miles of historic routes. This being the case, the questions always arise, how do we document these linear features and how do we remain consistent with recordation, context, significance and integrity beyond our lands? Many agencies are dealing with this using formal historic contexts or Multiple Property Documentation Forms as outlined by the United States National Park Service, while others are using exemptions and categorical exclusions in formal agreement documents. Archaeologists from BLM and NDOT will explore the advantages and disadvantages of the documentation methods that are currently being used to work towards a standard for this type of work in the state of Nevada.

Payntar, Nicole, Julia Earle (University of Texas at Austin), Camille Weinberg (University of Texas at Austin) and R. Alan Covey (University of Texas at Austin)**[100]** *Foreign Travel and the Development of Inca Archaeology in Cuzco, Peru*

The roots of Inca archaeology lie in reports and memoirs of 19th century travel, which culminated in Hiram Bingham's 1911 Yale Peruvian Expedition. These accounts traced routes that brought international attention to architectural remains of Inca royal estates and religious monuments, providing an early "guide" to would-be travelers and framing the formative years of Inca archaeology. As research proliferated in the past 50 years, some archaeologists have promoted the remains of royal estates as the materialization of the Inca dynasty, whereas others have advocated a more dynamic approach. Today, the articulation of a well-defined tourist circuit that connects Cuzco to Inca monuments in nearby areas perpetuates the historicist interpretation of the dynasty, promoting a sense of imperial timelessness. This poster uses GIS analysis to frame the historical development of the Cuzco tourist circuit in the broader archaeological context that has developed alongside it.

Pazmiño, Estanislao**[178]** *Entre los Andes y la Selva: Una aproximación al desarrollo prehispánico en el valle del Alto Upano, Ecuador*

Localizado en la alta amazonía ecuatoriana el entorno geográfico del valle del río Upano acoge una amplia diversidad ecológica y de suelos que, sin duda, resultaron atractivos para los diferentes grupos humanos que se asentaron en la región durante la época prehispánica. Por otra parte la ubicación estratégica hizo que el valle sin duda constituya un nodo importante en la interacción cultural entre los altos valles andinos y las tierras bajas

[189] *Talking to Our Selves? An Applied Zooarchaeology Citation Analysis*

Applied zooarchaeology has been on an apparent upward swing, gaining practitioners and seeing an increasing number of publications in natural science journals. Whether the intended consumers (conservation biologists, land managers) are receiving the message remains uncertain. We used a two-phase process to survey the literature pertaining to applied zooarchaeology: 1) keyword searching for highly cited applied zooarchaeology publications in Google Scholar; and 2) tracking of specific articles reflecting different scales of applied zooarchaeological research (species, community, ecosystem). For each source type, we organized bibliographic information in Excel and collected Library of Congress Subject Headings (LCSH) for the publication source to characterize the overall type of discipline(s) citing this work, whether archaeology, conservation biology, or related fields. We then assigned subject categories to each source by using the Library of Congress Linked Data Service to identify broader, discipline-level terms under which related LCSH could be grouped, allowing analysis of which publications were primarily within the boundaries of anthropology/archaeology, which were overall more closely associated with specific disciplines beyond anthropology/archaeology, and which were more interdisciplinary in nature. Preliminary results indicate a significant concentration of citing sources in the disciplines of anthropology and archaeology, suggesting that the product remains to be adequately marketed.

Peacock, Taylor (University of Victoria)

[305] *Names, Lineages, and Document Archaeology: Examining Traditions and Cultural Shifts in Jewish Personal Names*

While artifacts and grave goods remain an archaeologist's primary tools for gathering information on past populations, document and historical archaeology increasingly look to census records, obituaries, and family records, not just to confirm information about recovered artifacts, but as artifacts themselves. This study analyzed census data, birth records, and obituaries associated with three missing individuals assumed to be buried in Victoria's Congregation Emanu-El Jewish cemetery to understand how personal names could be used in identification. The study determined that shifts in personal naming traditions in a family can indicate religious conversion, as was found across four generations of the Sylvester family, preventing burial in the cemetery. The study also examined name shifts across a single individual: first, how those who create records impact the data they collect, as was the case of Huldah who became Hilda across three decades of census, and second, how individuals themselves may change names between documents, highlighting how personal choices impact identification, as was the case of Solomon, also Simon. In examining three different forms of naming as case studies, the results emphasized how crucial documents can be to identifying individuals and families, but in doing so, we must consider social and cultural contexts.

Pearsall, Deborah [323] see Berman, Mary Jane

Peasley, Ariel (California State University, Chico) and Georgia Fox (California State University, Chico)

[70] *Digging the Dockyard: An Analysis of Curation Practices in Antigua*

Museums and their exhibitions are representations of archaeological research. Archaeological excavations, associated objects, and subsequent interpretations frequently end up in museums and are often the only access the general public has to this knowledge. How objects are acquired, cared for, and presented ultimately affect what people learn about them in a museum setting. It is crucial for museums and museum professionals to maintain standard practices and care for these objects to the best of their ability with the resources they have available.

Our work at the Dockyard Museum in Antigua focuses on the difficulties and the potential for proper curation and care of unique archaeological artifacts while keeping a narrative the public is attracted to. Our project focused on rejuvenating the museum's displays, but through this process we realized the necessity for professional archaeologists to understand how curation and narrative at a museum have lasting implications on the archaeological record. This presentation highlights the history and current state of the Dockyard Museum while addressing how the care and display of archaeological materials affects the interpretation and preservation of the archaeological record.

Pedro Black, Marielle and Connie Reid (Kaibab National Forest, USFS)

[106] *Saddle Mountain Wilderness, North Kaibab Ranger District, Kaibab National Forest*

The Kaibab National Forest has a long history of completing site inventory, recordation, and research within wilderness areas with the help of assorted volunteers. Recent work on the North Kaibab Ranger District of the Kaibab National Forest in the Saddle Mountain Wilderness has been the result of the Wildcat and Fuller fires. Archaeological involvement during the fire planning process helps to proactively identify and protect heritage resources ahead of fire spread. Working with fire crews, archaeologists are able to prep, discover, and avoid/protect sites. Sites located in fire planning or burned areas are highly visible for easy recordation, and require resource damage assessments to evaluate and treat sites susceptible to erosion and other disturbances. The occurrence of fires in wilderness offer an opportunity to learn more about sites that may not otherwise be achieved except during directed research activities carried out with the help of volunteers. Exposed sites are ideal for research regarding fire effects and spatial and temporal land use studies, as well as gaining a more comprehensive view of features and artifacts within and among sites.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Peebles, Matt (Arizona State University), Barbara Mills (University of Arizona) and Jeffery Clark (Archaeology Southwest)**[83]** *The Risks and Rewards of Network Position in the Chaco World*

In a previous study Peebles and Haas (2013) compared brokerage (intermediate) positions in networks of ceramic similarity to measures of settlement growth and longevity for the late pre-Hispanic western U.S. Southwest (A.D. 1200–1500). Counter to expectations from many contemporary network studies where brokerage positions are associated with long-term advantage, this work instead suggested that broker settlements tended to be small, short-lived, and that brokerage was temporary. This example suggests that the outcomes associated with network position are not strictly determined but that culturally and historically contingent factors can influence how the risks and rewards of network position play out. In this study we take this investigation further by exploring the changing outcomes associated with brokerage positions across a major cultural/historical transition in the northern Southwest. Specifically, we track the relationship between brokerage and settlement trajectories across the rise and fall of the Chaco World (A.D. 800–1250). Initial results suggest that brokerage positions may have conferred advantage that did result in settlement growth and longevity during the height of the Chaco system, but not before or after. In light of this finding, we explore the role that political organizational complexity may play in how network ties are valued.

Peebles, Matt [287] see Dungan, Katherine

Peixotto, Becca (American University)**[239]** *Paths of Connection in the Great Dismal Swamp: Wetland Watercourses as Indigenous and Maroon Landscape Features*

Speckled with mesic islands and peat hummocks, the soggy lowlands and standing water of the Great Dismal Swamp in Virginia and North Carolina (USA) were home to thousands of African and African American Maroons ca. 1608–1863 and were a significant feature of the landscape of Indigenous Americans for many centuries prior. The Great Dismal Swamp Landscape Study and the Swampscape project archaeologically investigate the landscape of resistance created by Maroons. The Dismal is far from a homogenous morass and surrounded by seemingly impenetrable vegetation deep in the Swamp's interior, one may be tempted to view the small dry landforms on which Maroons, Indigenous people and others built structures, had fires, and engaged in other activities of daily life as isolated locales. Recent LiDAR studies and exploration has revealed a significant topographic similarity amongst the sites and potential sites identified to date in this varied wetlands: their proximity to a stream or watercourse. This poster examines the watercourses and what they may have meant for travel, community connections, and contact with the world beyond the Swamp.

Pellegri, Evan [106] see Dillingham, Frederic

Pelton, Spencer (University of Wyoming)**[58]** *A Thermoregulatory Perspective on the Folsom Archaeological Record*

Human cold intolerance unambiguously suggests that mid to high latitude prehistoric foragers used thermoregulatory technologies, such as clothing and housing, to cope with the environment, even if archaeologists rarely find them in the record. Others have recognized this, but none have developed a formal means of expressing variation in thermal technologies in the archaeological record over widespread temperature clines. I draw from observations collected during ethnoarchaeological fieldwork with the Mongolian Dukha reindeer herders to understand the material correlates for thermal technologies. I then present an analysis of 53 published Folsom archaeological assemblages to test the notion that phenomena associated with thermoregulation, such as end scrapers and houses, become more abundant in colder environments. I make the case that my results have widespread implications for understanding variation in forager archaeological sites independent of and complementary to subsistence-based interpretive frameworks.

Pelton, Spencer R. [105] see Robinson, Erick

Peña, Jose**[65]** *Casma Domestic Life at the El Campanario Site, Huarmey Valley—Peru*

Households are the most important social unit in every society. The production and consumption of resources within the household can provide information on how resources were obtained, stored and distributed within the Household or the community. Recent archaeological research has provided significant information about the Casma polity, which occupied the northern coast of Peru between 700–1400 A.D. The Casma society is viewed as a centralized polity that controlled several coastal valleys. Although certain aspects of the Casma society are still unknown, the research conducted at El Campanario was oriented towards understanding the domestic life of the Casma people. The excavations within the households at El Campanario has provided baseline information that will aid in reconstructing the domestic activities related to food preparation and consumption as well as craft production. The craft activities identified at the site include pottery manufacture, textile production, maize beer preparation, and fishing.

[162] *The Ch'ulel of Architecture of Power: Preclassic Ritual Behavior in the Northern Maya Lowlands*

How does a building become architecture of power? How can this power be release or lost? There are many ways in which a building can be imbued with certain attributes that allow expressing and regulating unequal power relations. Along with the form and style of buildings, ritual is perhaps one of the most important means. Through ritual performance, actors imbue the building with the ch'ulel, ensouling and animating it; obliged the ch'ulel to leave the building, killing the animate construction, and make it possible for the ch'ulel to reborn, favoring it to become more powerful. In the lowlands, the performance of rituals that had as purpose to animate, kill or make reborn buildings is a long-standing tradition that dates back to the Middle Preclassic period. This paper focuses on Structure 1714-Asub of Xaman Susula, a public building interpreted as architecture of power, precursor of the Classic palaces that had administrative and ritual functions but lacked domestic functions of palaces. During the archaeological explorations, we found material remains of ritual behavior that indicates that Structure 1714-Asub was alive and powerful. This building was likely manipulated by actors to wield power over other members of their community.

Penny, Dan (The University of Sydney) and Tegan Hall (The University of Sydney)

[175] *Urban-Palaeoecology of Cambodia's 'Middle Period'*

The transition from the sprawling Angkor kingdom with its vast, low-density urban forms, to a constellation of smaller cities on the Mekong River was accompanied by profound changes to urban ecology and to landscapes—both in the failing low-density cities, and in the burgeoning trade-based centres that replaced them. Here, we present a paleo record of urban ecology that responds, in part, to changing population dynamics across Cambodia during the 15th to 19th centuries C.E. Implications for current models of 'urban diaspora' following profound social transformation will be discussed.

Pentney, Sandra (Atkins) and Stephen Bourne (Atkins)

[135] *Using the City Simulator Tool to Aid in Preservation during Resiliency Planning*

The SAA has held sessions on how climate change is affecting cultural resources for several years now. We began with characterizing the impacts and concerns on how to preserve or mitigate. We have discussed ongoing studies, and strategies to engage the public and local government in conservation and recordation initiatives. This year, Atkins will be presenting a newly developed tool to help planning organizations visualize physical impacts to built environment, traditional cultural properties, and archaeological resources. The 'City Simulator Tool' will be presented as a method to understand climate change impacts at the community level, with particular emphasis on looking at impacts to all forms of cultural resources. By using this tool, we can help agencies see the effects of different resiliency plans on historic planning efforts and help agencies evaluate which plans represent the least impact to resources.

Perales, Manuel

[273] *To walk in order to remember... and to dominate: Inca Roads and Hegemonic Processes in Jauja, Central Highlands of Peru*

Previous research on the Inca road system have generally developed functionalist perspectives on their associated characteristics and infrastructure, inherited in several cases from processualist approaches that focused primarily on their economic and military role. However, more recent studies on the nature of the Inca state have varied substantially, granting an outstanding importance to ideology and religion as mechanisms of domination. Based on these considerations, this paper presents an approach to the role that would have been played by the roads in the strategies of domination and hegemonic processes established by the Incas in the region of Jauja in the central highlands of Peru. Based on a set of data obtained by the Qhapaq Ñan Project in that territory, I propose that the road system was thought of as a kind of technology of power in the Foucauldian sense of the term.

[105] *Human Demography and Ecosystems: Comparative Approach of Human Age-at-Death Profiles from Northpatagonia (Southern Mendoza, Argentina)*

The aim of this presentation is to provide information about human age-at-death profiles in order to understand the environmental/demographic dynamics of pre-Hispanic people from Southern Mendoza. Burials from 20 archaeological sites are included in age-at-death profiles, which are compared to discern regional particularities. This is a transitional area between hunter-gatherers groups and farming populations. The presentation evaluates if the introduction of domesticated resources in the diet and the new agricultural subsistence patterns altered the hunter-gatherer demographic dynamics, and specifically if human demography declined during the Little Ice Age (LIA).

[217] *Shell Heaps as Indicators of Resource Management*

The Neolithic Revolution of the 9th millennium BC marks the period when forager groups independently experimented with the management and, in some instances, the domestication of terrestrial plants and animals. However, global evidence for human consumption and management of gastropods predates the Neolithic Revolution, indicating that terrestrial and aquatic snails were an important resource for human societies during the Holocene. Abundant deposits of aquatic snails are reported from archaeological sites in Mesoamerica, Japan, and China, while the consumption of land snails is well-documented in the Iberian Peninsula, the circum-Mediterranean area, Africa, and North and South America. These studies show the temporal depth and spatial breadth of human's knowledge of, and interaction with, gastropods. Along the interior waterways of the American Southeast, accumulations of freshwater gastropods appear in archaeological sites during the pan-regional culture phase of the Shell Mound Archaic, from approximately 7000 to 1000 cal BC. Using data from zooarchaeology, geoarchaeology, invertebrate zoology, and taphonomy, we show that the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

anthropogenically induced freshwater gastropod deposits along the Cumberland River in the American Southeast comprise the oldest documented occurrence of freshwater aquaculture in the Americas, ca. 5300 cal BC.

[334] *Partnerships for Heritage Stewardship*

The objective of my Master's thesis was to formulate a history of the Carroll Cabin and farm, a historic log house located in Fayette County, Pennsylvania on Department of Conservation and Natural Resources (DCNR) land. My research focused on how archaeological and historical records could be used to answer questions about the farm's extant home and the property's history. In Pennsylvania and other states (and at the federal level) multi-use public land managers are responsible for similar structures and the associated archaeological sites. These resources are often located in remote areas with little or no associated primary records, which means there is no construction date available to assist with resource management and a significance assessment. Dendrochronology, or tree-ring dating, is an affordable and effective methodology that has the potential to date log buildings or structures whether primary records exist or not. Partnership research using such technology is not only beneficial to the story of Pennsylvania and the region, it is also important for promoting heritage stewardship on public land.

Perez, Daniel and Karen Harry (University of Nevada, Las Vegas)

[164] *House 47: A Case Study of Abandonment and Trade in the Lowland Virgin Branch Puebloan Region*

Considerations of chronology, chronometry, and systemic contexts of archaeological sites in the American Southwest have primarily focused among the larger prehistoric cultural centers (e.g., Hohokam) throughout the history of archaeological research in this region. Research pursuits beyond the southern and eastern regions of the American Southwest—particularly within the Virgin Branch Puebloan cultural region—have not been pursued accordingly for various reasons. Seminal work by Margaret Lyneis (University of Nevada, Las Vegas) in the lowland Virgin Branch Puebloan (VBP) region, among other scholars, provide the context for the present study in which a fuller understanding of the prehistory of the VBP region is sought. House 47, an archaeological site in the lowland VBP dating to the early Pueblo III period, likely represents one of the final occupations prior to abandonment of the lowland region. This paper considers both the unusually large size of House 47 (comprising more than 100 houses) and what recent excavations at the site suggest regarding abandonment of the region and related impacts on trade networks during the Pueblo III period.

[195] *At the Intersection of Academia and Activism: Using the Historical Ecology Framework toward the Conservation and Restoration of Natural and Cultural Heritage*

Historical ecology has become one of the most relevant research paradigms in understanding the long-term relationships between humans and their environments. Its multidisciplinary approach dissolves the boundaries between the social and natural sciences to bring together disciplines such as archaeology, ecology, biology, anthropology, ethnohistory, and geography toward the conservation and restoration of natural and cultural heritage. This paper specifically explores archaeology's unique position within the framework of historical ecology and raises questions regarding its role in contemporary public policy discussions. Archaeological data are invaluable assets in addressing current environmental issues, establishing baselines for natural resource management strategies, and providing insight into long-term human-environment interactions. Concurrently, scholars and academics, traditionally avowedly apolitical, are increasingly redefining the intersection of being an academic and an activist. We bring attention to the community of scholars who engage with historical ecology and present the case for a historical ecology interest group within the Society for American Archaeology. To do this, we present case studies that explore how the historical ecology framework is being used in various contexts to inform and influence management of both natural and cultural heritage.

Pérez, Jan (University of Puerto Rico, Rio Piedras Campus) and Paola Schiappacasse (University of Puerto Rico, Rio Piedras Campus)

[57] *Recreating the Late 19th Century Urban Landscape of Puerta de Tierra, San Juan, Puerto Rico*

Throughout the 19th century, the Spanish colonial capital of Puerto Rico, San Juan underwent an urban expansion outside its city walls. Puerta de Tierra, a neighborhood located east of the walls, registered a steady growth between the 1870s and 1890s. Through the use of primary documents such as maps, construction permit requests, blue prints, and historical photographs it is possible to reconstruct part of this urban landscape. This information in combination with census records can also help to identify the characteristics of this working class sector of the city of San Juan, as well as the material culture that could be found if archaeological excavations were to be conducted in these houses.

[25] *Infancy and Breastfeeding at Cerro Jazmín: Isotopic Data from a Late-Terminal Formative Population in the Mixteca Alta, Oaxaca*
 We present isotopic results from 25 adults and children from Cerro Jazmín. Bone collagen (n= 17) and bone and enamel apatite (n=21) isotopic data provide C, N, and O values describing diet and breastfeeding patterns. Carbon values suggest a narrow diet heavily based on maize and little animal protein. Individuals between 0–3 years of age had significantly higher nitrogen and oxygen values than adults, suggesting that these infants may have still been breastfeeding at the time of death. Weaning likely occurred between 3–6 years of age when C3 foods, perhaps squash, were introduced in the weaning diet. By 6 years of age isotopic values matched those of adults. Alternatively, since the subadults in the sample are those who did not survive into adulthood, their elevated nitrogen and more negative carbon values may be attributed to severe stress prior to death. Therefore, we also consider the proportion of adults versus subadults recovered from different periods of occupation at Cerro Jazmín as well as pathological and traumatic lesions to discuss broader patterns of infant health and mortality.

[222] *Students Discover Heritage: Lessons from the Field Boston University Field School in Archaeological Heritage Management (Menorca-Spain)*

Boston University's field school in Menorca, Spain, started 17 years ago as a traditional field school experience. Over the years, we incorporated the study of archaeological heritage management—both theoretical and practical—as an integral part of the curriculum. In the last decade, the increasing number of students interested in cultural heritage management inspired us to move to a heritage management-only field school. This poster will present the results of our first season. Menorca is a UNESCO biosphere reserve and candidate for World Heritage status. Menorca preserves archaeological and cultural sites from every period of its history, ranging from megalithic Bronze/Iron Age settlements to the remains of the Spanish Civil War. The island's rich cultural legacy, together with its impressive and diverse natural settings, makes it an outstanding laboratory for studying heritage management. During the field school we introduced students to the principles and practice of archaeological stewardship: preservation, interpretation, management, and public outreach. There is nothing more eye-opening than learning this in situ: at sites, museums, and throughout the landscape. A student project researched links between the US and Menorca. From Admiral Farragut to the Second World War, students discovered a fascinating common past worth safeguarding for the future.

Perkins, Leslie and Travis Stanton (University of California Riverside)

[238] *Light Detection and Ranging (LiDAR) of San Gervasio, Isla Cozumel, Quintana Roo, Mexico*

The use of Light Detection and Ranging (LiDAR) in Mesoamerican archaeological research has been steadily increasing. Building on this knowledge, LiDAR was conducted during the summer of 2017 over a 6km² area of the prehispanic site of San Gervasio, Isla Cozumel, Quintana Roo, Yucatan, Mexico. This was part of a larger survey and mapping project conducted by the Proyecto de Interacción Política del Centro de Yucatán (PIPICY) spearheaded by Dr. Travis Stanton.

The proposed poster will discuss LiDAR imagery of San Gervasio, Cozumel along with overlays of excavations done during the Spring of 2017, which focused primarily on ossuary structures located just outside of the site center. Here I will be presenting preliminary findings of the mapping project at San Gervasio and discussing how the newly acquired LiDAR matches with what has been ground truthed through traditional survey methods, and what future research is on the horizon with the aid of this new data.

[171] *Hurricanes as Agents of Cultural Change: Integrating Paleotempestology and the Archaeological Record*

Hurricanes are major climatological events with significant impacts in tropical and extra-tropical regions worldwide. Despite this, little research has been undertaken on the effects of hurricanes and other intense storms on prehistoric societies. New evidence from the field of paleotempestology—the study of past hurricane activity using geological proxy techniques, such as lagoon sediments and speleothems—is shedding light on how hurricanes varied over the Holocene in terms of frequency, geographic distribution, and magnitude. This information, in conjunction with archaeological data from coastal locations, may provide a means for helping us better understand mechanisms for human adaptation and resilience in the face of abrupt, high-magnitude climatic events. The purpose of this paper is twofold: 1) to summarize the current state of knowledge of Holocene hurricane variability in a key region—the Caribbean—where recent findings have identified a number of centennial-scale periods of hurricane “hyperactivity”; and 2), to identify and evaluate the ways that human responses to hurricane activity can be identified in the archaeological record at different spatial and temporal scales, including house and dwelling architecture, to the planning of settlements in protected areas, to regional-scale migration and demographic change.

Perri, Angela (Max Planck Institute for Evolutionary Anthropology)

[212] *New Evidence of the Earliest Domestic Dogs in the Americas*

While the arrival of domesticated dogs with an initial human migration has been the most reasonable explanation for their presence in the Americas, evidence for Paleoindian dogs has proven elusive. Here, we present the identification and direct radiocarbon dating of an isolated dog burial from Stilwell II, an Early Archaic site in the Lower Illinois River Valley. We also present new direct radiocarbon dates for two dogs from the nearby Archaic Koster site. These dates confirm that the Stilwell II and Koster dogs represent the earliest directly-dated evidence for domesticated dogs in the Americas and the oldest intentional burials of individual dogs known in the worldwide archaeological record. The appearance of the earliest domesticated dogs in the Midwest around 10,000 years ago presents a conundrum both temporally and spatially. If dogs arrived with the first migrating human groups, the earliest dog remains should appear in northern and western North America during the Paleoindian period.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Perrotti, Angelina (Texas A&M University)**[290]** *Non-pollen Palynomorphs Reveal Environmental Fluctuations in the Terminal Pleistocene Southeastern United States*

Paleobotanists and palynologists must be able to identify various types of plant remains from archaeological sites. Because of the difficulty of becoming familiar with the vast array of microfossils found in a typical pollen sample, non-pollen palynomorphs (such as fungal spores) are often overlooked in traditional palynological analyses. However, they can be indicators of various environmental changes such as fluctuations in plant and animal communities, erosion and fire events. This paper demonstrates the utility of fungal spores as paleoenvironmental proxies at two submerged sites in the Southeastern United States: Page-Ladson, Florida and White Pond, South Carolina. Non-pollen palynomorph assemblages at these sites provide evidence of considerable disturbances to vegetation, including fires, grazing and browsing regimes, and periods of erosion. Of particular interest are the coprophilous fungal spores, which indicate a decline in megaherbivores at both sites by ~12,600 cal BP. The information provided by non-pollen palynomorphs can enhance other paleoenvironmental data to further contextualize cultural adaptations of Terminal Pleistocene peoples.

[290] *Chair***Perry, Laureen (U.S. Bureau of Reclamation)****[164]** *Margaret Weide Lyneis—Archaeologist, Professor, Mentor, Student, and Friend*

Dr. Margaret Lyneis had a long career as an archaeological researcher, preservationist, and scholar, starting with field research in the 1960s when few women were in the field and as a professor at the University of Nevada, Las Vegas. Early research was in the Warner Valley of Oregon, in California, and in the Great Basin. As she focused her research on Far Western Puebloans, Dr. Lyneis became the expert on their early occupation of southern Nevada and the Virgin Region. Her influence on the world of archaeology extends far beyond that research as her students and colleagues continue applying her approaches, professionalism, and passion to other archaeological topics, careers, and advocacy. This symposium barely touches the extent of Margaret Lyneis' influence on archaeology.

Person, Dylan (University of Nevada, Las Vegas)**[186]** *Rocky Refuse or Useful Utensil?*

What is the value of an expedient lithic tool? By what standard is its performance judged? Analysis of lithic debitage has long focused on morphological characteristics of flakes to determine fracture mechanics and other technological aspects of the flintknapping process. As such, most lithic flake termination types are seen as the result of misdirected force as opposed to techniques producing a mechanistically ideal flake type. What does this mean for past humans who did not follow the analytical approach employed by contemporary archaeologists? Could these flakes have been useful for reasons not apparent from study of fracture mechanics? Though archaeologists have long been aware of the dangers of applying current knowledge to past contexts, does this mean that there is no way to infer human activity involving these non-ideal flakes? Behavioral archaeology offers a method to explore this issue through analysis of the performance characteristics of flake termination types in common daily activities known from the archaeological record. This allows comparative analysis between termination types to use as a basis for archaeological inference. Combined with an experimental approach, this study utilizes performance characteristic modeling to identify behavioral contexts for the use of non-ideal flake types in past activities.

Peter, Damgaard [143] see Lynnerup, Niels

Peters, Ann (University of Pennsylvania Museum)**[141]** *Cultivation and Herding Practices, Fiber Colors and Textile Styles in the Paracas-Nasca Transition*

Improving documentation of artifact assemblages in the funerary contexts of the Necropolis of Wari Kayan (Paracas site, south coast of the Central Andes) leads to identification of multiple contemporary textile styles as well as their transformation over the period of cemetery use (c. 250 BCE to 250 CE). While artifact variability in the region has largely been organized in hypothetical phases, expanded data on garment design and production details, as well as imagery, is most usefully organized and correlated using a formal typology. While social diversity may account for a larger percentage of formal variation than has been considered under the phase model, hypothetical temporal sequences among garment styles imply processes of adoption and syncretism. While to date we cannot document the geographic loci of garment production, correlations between characteristics of plant and animal fibers, natural and dyed colors and particular style groups suggest a vertical organization of production and exchange that ranged from agricultural selection and herd management practices to the contribution of a finished textile to a particular mortuary rite. Artifact forms and component materials support a model of sociopolitical relationships linking diverse communities of practice, whose presence, prominence and self-definitions change over time.

[141] *Chair***Peters, Mallory (California State University, Chico), Jessica Curry (California State University, Chico) and Eric Bartelink (California State University, Chico)****[179]** *Analysis of Anatomical Dissection at Point San Jose Hospital, Fort Mason, San Francisco*

During a 2010 National Park Service project to remove lead contaminated soils from behind a historic hospital at Point San Jose (now Fort Mason), San Francisco, a medical waste pit containing commingled human and faunal remains was discovered. From 1864–1903, several military surgeons were posted at the Point San Jose Hospital to treat military personnel.

Analysis of the human remains revealed evidence of anatomical dissection indicated by numerous incised cut marks, saw cut marks, and other postmortem modifications. The incised cut marks and saw cut marks have significant implications for interpreting the purpose of the Point San Jose skeletal material. The presence of saw marks through many skeletal elements signified that the remains were likely used for a variety of purposes. Possible indicators that the skeletons were used for autopsies include saw marks through the skull and sternum. The presence of both incised cut marks and saw marks on other elements suggested removal of soft tissue and were indications of dissection or prosection performed during anatomical teaching, training, or research.

Peterson, John (University of Guam)**[145]** *World Heritage Listings, Changing Climate, and the Salalah Doctrine: Archaeological Heritage Management at Nan Madol Monument, Pohnpei, FSM*

Nan Madol monument in Pohnpei in the Federated States of Micronesia was inscribed on the World Heritage list in July 2016. The same day it was listed on the Endangered List for World Heritage sites by the Committee. The designation was meant to insist on the seriousness of conservation and

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

management planning and it has had a profound impact. A Conservation Plan has been launched, supported in part by UNESCO, and fine-grained monitoring with geocontrols, 3-D mapping, UAV structure-in-motion models, Synthetic Aperture Radar imaging, and detailed descriptions and monitoring for each islet have been initiated. Governance policy in the FSM, Pohnpei, and the Nahnmwarki of Madolenihmw is being reviewed for sustainable preservation and management. Monitoring for site impacts also supports observations of sea level rise, storm surge, erosion and siltation, and subsidence around the site. Nan Madol's conservation management is a watch on the effects of climate change as well as ongoing environmental observations for the site.

Petraglia, Michael

[329] *Acheulean Hominins and Out of Africa Dispersals: Challenges and Advances*

The dispersal of Acheulean hominins outside of Africa is one of the most important research areas in human evolutionary studies, having been the topic of paleoanthropologists and archaeologists for many decades. Yet, precise knowledge about the timing and geographic movement of archaic hominins across Eurasia is still in its infancy. The aim of this presentation is to discuss what we currently know about the distribution of Acheulean hominins, and to report on new field work findings in southern Asia, particularly in the Indian subcontinent and the Arabian peninsula. We examine technological trends and present new information on the dating of archaeological sites. We examine the role that climate change plays in the demographic history of Acheulean hominins and whether there is temporal overlap of archaic species and advancing groups of *Homo sapiens* populations. We address long-standing questions about whether Acheulean tool-making hominins moved into Eastern Asia, and the implications of this information with respect to our evolutionary history.

Petrie, Cameron (University of Cambridge), Adam Green (University of Cambridge), Hector Orengo (University of Cambridge) and Ravindra Singh (Banaras Hindu University)

[121] *Hidden in Plain Sight: Reconstructing Landscapes of Urbanism in Northwest India*

Archaeologists cannot understand the urban process based on investigations at urban centers alone. In the Beas River Landscape and Settlement Survey, Wright contributed greatly to understanding of landscapes in South Asia's Indus civilization (2600–1900 B.C.), revealing necessity and value of integrating settlement data into broader analyses of urbanism. Research on the Indus civilization's settlement distributions highlights the presence of an array of archaeological sites spread across a diverse range of environments. This is particularly true in northwest India, a dense locus of settlement before Indus cities emerged and after they declined. It is not clear, however, whether our current knowledge is representative of past settlement distributions or an artifact the early methods and previous assumptions. Fieldwork that combines the analysis of historic maps with remote sensing site detection methods is highlighting large numbers of archaeological sites, some of which may have been documented in the late 19th and early 20th centuries. These sites, never included in the analysis of archaeological landscapes, have the potential to revolutionize our understanding of Indus, Early Historic and Medieval urbanism throughout the subcontinent.

[147] *De Facto Refuse, Termination Deposits, and Abandonment Processes: Contextualizing the "Problematical"*

Archaeologists working in the Maya area frequently find dense deposits of artifacts that are classified 'terminal deposits,' 'final deposits,' or 'problematical deposits'. These classifications may accurately reflect a deposit's stratigraphic placement, but ultimately mask or even misrepresent the diverse social behaviors which led to the creation of such deposits. Excavations in the courtyard in front of Structure B-6 at Xunantunich, Belize, exposed a dense deposit of artifacts. Through detailed analysis and recovery of the artifacts and ecofacts and an emphasis on both recording and analyzing the microstratigraphy, we argue that this deposit was de facto refuse left by people who occupied the group after a period of abandonment. Our analysis more broadly underlines the importance of careful excavation and contextual analysis of these deposits in order to understand the behaviors associated with each one. Such analyses form the basis for the creation of behaviorally distinct categories of final deposits.

Pettitt, Alisa (George Mason University and Fairfax County Park Authority) and Sven Fuhrmann (George Mason University)

[331] *Educational AR and VR Applications for the Interpretation of Archaeological Sites in Northern Virginia*

Virtual reality (VR) and augmented reality (AR) applications can influence the user's perception of the world. In regards to archaeological sites these technologies can be used as educational tools to recreate past environments and offer interpretive perspectives on history. This research examines several archaeological sites in the Northern Virginia region and investigates how educational VR and AR applications developed through accessible, user-friendly platforms can aid in reconstructing and interpreting cultural resources.

Pettitt, Paul (Durham University, UK)

[136] *Neanderthal Activities in Caves: Was There a Ritual Dimension?*

We know that Neanderthals used the mouths of caves for habitation, and on occasion buried their dead in such contexts. The behavioural repertoire was recently extended to include the assembly of a circle of stones deep in a cave in France. But can any evidence be taken to imply specifically 'ritual' behaviour? I build here on ongoing collaborative research on the emergence of art, and on wider Neanderthal activities in caves and their environs to address the question as to whether 'ritual' use of caves was specific to *Homo sapiens*, or shared with our closest sister clade.

Peuramaki-Brown, Meaghan (Athabasca University) and Shawn Morton (Northern Arizona University)

[37] *Maya Monumental 'Boom': Spatial Development, Rank Ordering, and Planning Considerations at Alabama, East-Central Belize*

In the 1980s, archaeological investigations by the Point Placencia Archaeological Project (PPAP) noted the rapid, single-phase development of monumental construction at the Maya site of Alabama in the Stann Creek District. Though never fully investigated by PPAP, this rapid, 'boom-like' development during the late facet of the Late Classic to Terminal Classic periods is being pursued in current investigations by the Stann Creek Regional Archaeology Project (SCRAP). This presentation, by directors of the SCRAP project, discusses ongoing research at Alabama, particularly the spatial, rank order, and planning analyses being considered as part of epicentre investigations, which we hope will shed additional light on the interesting development processes we believe are occurring in this understudied material culture sub-region of the eastern Maya lowlands known as East-Central Belize.

[176] *Overlapping and Shifting Networks: Comales, Spouses and Other Social/Material Interactions between/within Highlands and Coast in Colonial Guatemala*

Ceramic assemblages of Postclassic and Colonial Maya sites in highland and coastal Guatemala are dominated by comales: griddle-like cooking vessels indicative of a maize tortilla diet. Given that some archaeologists have interpreted the appearance of the nixtamal/tortilla/comal complex in Guatemala as evidence of the "Mexicanization" of the Maya region, the Pacific coastal region of Guatemala -and its Central Mexican diasporic populations- is seen as the likely source of comales. As a result, comales are useful for tracking the degree/nature of entanglements between coastal and highland populations. Whatever the origin of comales, by the Colonial period, their presence is ubiquitous, despite the fact that documentary sources speak to strained interactions and severed social and economic networks between coastal Pipil and highland Kaqchikel communities. This paper explores coastal and highland interactions prior to and after colonization through the comparative Instrumental Neutron Activation Analysis (INAA) of comales at the Pacific piedmont Kaqchikel Maya site of San Pedro Aguacatepeque and Guatemalan coastal sites. We also draw on Colonial censuses, other archival sources and ethnoarchaeological research as additional lines of evidence that help reconstruct the dynamic, varied and overlapping social and material networks between and within coast and highlands in Postclassic and Colonial Guatemala.

[334] *Archaeology at Warren Grove Gunnery Range, Pine Barrens, Burlington County, New Jersey*

In the winter of 2015–2016 and the spring of 2017, the University of Montana-Center for Integrated Research on the Environment and GAI Consultants (UM-GAI) conducted an archaeological survey and evaluation project at the New Jersey Air National Guard's Warren Grove Gunnery Range. The project was funded by the Air National Guard through a cooperative agreement with the United States Army Corps of Engineers (Omaha District) and the UM. UM-GAI completed archaeological survey of ca. 9,911 acres of the range. The survey identified and evaluated nine historic/modern sites and one of three previously-reported prehistoric sites. Two sites are recommended NRHP eligible as part of a historic charcoal production complex: UMWG-1 is a probable late 19th century collier's hut with ceramics and associated charcoal production features, and UMWG-9 is a nearby set of at least eight charcoal kilns and possible associated transportation features. UM-GAI is participating in public outreach programs including schools and conferences as well as updating the GIS archaeological predictive models for the range and region.

[40] *Escaping from the Tomb: A Spatial Analysis of Possible Escape Routes in the Valley of the Kings, Egypt*

Howard Carter discovered the relatively intact tomb of Tutankhamun (KV 62), one of the last kings of the Eighteenth Dynasty of Egypt, in the Valley of the Kings in 1922. Prior to the discovery, Carter discovered several small artifacts in the cliffs above the valley's floor, which he proclaimed were indicators of a possible escape route of the ancient tomb raiders from the Valley of the Kings. During the excavation of the tomb, Carter also claimed to have identified two distinct robberies that most likely occurred with a few years of the initial interment. Other scholars have debated this assertion. A spatial analysis of the Valley the Kings will provide insight into this debate. This paper will investigate the possible routes ancient robbers may have taken while escaping from the tomb of Tutankhamun through the utilization of Geographical Information System (GIS) analyses including viewshed and least cost pathways. The most efficient route out of the valley will determine if Carter's initial claim of finding dropped artifacts from the tomb was in correct or not.

[99] *Taphonomic Comparisons of Stone Tool Transport: Surface vs. Excavated Collections*

It has been argued that surface assemblages may provide insights into questions regarding large scale patterns of human behavior such as mobility and stone tool transport. However, excavated material is often preferred over surface assemblages due to concerns of potential biases introduced by the process of exposure. Here, we examine this claim by comparing measures of stone tool transport between surface and excavated assemblages. Surface and excavated lithic assemblages were collected from the similar locations in East Turkana, Kenya. Size distributions of each assemblage were compared to determine differences that may be introduced by taphonomic bias. Measures of cortex, volume, and stone tool reduction were then applied to each assemblage to determine influence of lateral displacement on proxies of stone tool transport. Preliminary results suggest that, despite gross differences in size distributions between the two assemblages, signatures of stone tool transport preserved in excavated assemblages are also reflected in surface assemblages. This is dependent on the measures of transport that are investigated. A discussion of the preliminary results and the efficacy of various measures of stone tool transport is reviewed.

Phillips, Laura

[253] *Repository Reflections: Where's the Humanity?*

As the neutral repository appointed by the court, the Burke Museum has played a unique and often frustrating role as temporary caretaker of the Ancient One/Kennewick Man. Decisions on overall curation, research and access resided with the US Army Corps of Engineers, yet the Burke provided the environment, security, and safety. Museum standards of access and care are not straightforward, and staff tried to balance ideas of neutrality and bioethics with real people and their needs. The Ancient One lived thousands of years in the past, yet he is now deeply rooted in the present. His journey has highlighted some key bioethical issues of our time—in particular, how we understand what constitutes a human being, and how that understanding shapes the tracking of research and analysis.

Phillips, Lori (Washington State University), Erin Thornton (Washington State University) and Eleanor Harrison-Buck (University of New Hampshire)

[7] *Understanding Animal Use at the Wetland Maya Site of Chulub*

Reconstructions of ancient Maya animal use often emphasize the importance of terrestrial species, such as deer, to the overall diet. While these species played an important role, much less attention has been paid to the use of aquatic resources despite the presence of resource rich perennial wetlands in the Maya lowlands. To further understand this crucial area of the Maya-environment relationship, we investigated the site of Chulub located in the Western Lagoon Wetlands of Belize. This site dates to the Classic-Postclassic transition (ca. AD 800–1200) and contains only one formal plaza, but it includes numerous outlying structures associated with a series of artificial pond and canal features. During the 2017 season, we tested one of these structures and performed a series of test pits targeting midden deposits in the main plaza. The preliminary zooarchaeological results presented here suggest terrestrial and aquatic species, particularly freshwater turtles, were important components in the overall subsistence of Chulub inhabitants. The presence of ceramic net weights further corroborates the importance of aquatic species, possibly raised and farmed in the nearby ponds. These preliminary results highlight the importance of aquatic resources within Maya subsistence and support the need for further research within this understudied area.

[91] *Analysis of Settlement Patterns near the Big Burro Mountains*

This poster presents the results of an archaeological survey of Pitchfork Ranch, located near the Big Burro Mountains in southeastern New Mexico. The survey was conducted by staff and students of the Archaeology Southwest Upper Gila Preservation Archaeology (UGPA) field school from 2015 to 2017. There is evidence on the ranch of human activity ranging from possible Paleolithic and early Archaic sites up to 20th century sites. Using GIS and geospatial data collected during this survey it is possible to examine the extent of human occupation on the ranch and analyze changes over time in settlement patterns and land use in the region. The Pitchfork Ranch is the location of the Burro Creek Cienaga, and the data from this survey is useful for understanding human use of this rare environment and hydrological resource. Additionally, the survey data could help develop a better understanding of Mimbres-culture sites outside the Mimbres Valley and Upper Gila.

[171] *Earthquakes as Nonhuman Agents in the Roman—Late Antique Mediterranean*

Recent studies of the sociology of contemporary earthquakes have emphasized the generative physical spaces of potentiality created by these disasters: the destruction of earthquakes, while traumatic for survivors, also clears the way for large-scale infrastructural and architectural development programs that can re-shape aged urban environments to better reflect changing societal values and priorities. This paper offers a survey of earthquakes as non-human change agents in the Roman and Late Antique Mediterranean, with especial focus on the cities of Ephesus, Antioch, and Phrygian Hierapolis. While contemporary Roman sources tend to describe urban rebuilding after earthquakes in a symbolic manner with a generic picture of cities “rebuilt” (ἀνοικοδομήσθαι) or “restored” (ἀνεύθει) with state-directed support in coin or labor, these literary images rarely correspond with the archaeological evidence. Rather, earthquake events in Roman cities provided opportunities for adaptation and the implementation of new planning schemes.

[9] *Seeing Red: An Analysis of Archaeological Ochre in East Central Missouri*

The Truman Road Site (23SC924), St. Charles County, Missouri, features a diversity of material remains and a long periods of occupation mostly occurring during the Late Archaic (3000—2500 BC) and Middle Woodland (100 BC—AD 500). For this region of prehistoric Missouri, ceramics and chert constitute the main evidence for understanding trade and cultural dynamics. Despite its relative ubiquity among sites, ochre has rarely been considered in such studies. Recognizing that this material is a valuable component of material culture, we used NAA to analyze a collection of ochre from the Truman Road site (n=31) and seven specimens total from four other nearby sites. Results indicate no significant temporal or spatial patterning of ochre usage or acquisition in the total sample. Similarly, no correlation exists between the chemistry and artifact type. Finally, the assemblage is compositionally distinct from previously analyzed samples from elsewhere in region. Precise provenance has yet to be conclusively determined due to the dearth of comparative data in Missouri. Although these artifacts could not be linked to a single acquisition locale, the results remain an important addition to our understanding of the characterization and diversity of ochre and its usage in prehistoric Missouri.

Pierce, Karen (Pacbitun Regional Archaeological Project) and Mike Lawrence (Pacbitun Regional Archaeological Project)

[256] *Recent Building Excavations in the Triple-Courtyard “Palace” Group at the Ancient Maya Site of Pacbitun, Belize*

Adjacent to Plaza B at Pacbitun is a Classic Period “palace” complex consisting of three conjoined courtyards each ringed by elevated range structures, likely serving elite-residential and administrative functions. Previous excavations indicated initial construction in the Early Classic period with numerous modifications made in the Late Classic, and preliminary evidence of occupation or use into the Terminal Classic period. The Pacbitun Regional Archaeological Project has begun to explore this palace complex to gain a better understanding of its architectural chronology and function in order to broaden our knowledge regarding the sociopolitical and economic changes taking place at Pacbitun during the Late to Terminal Classic period. At Structure 23 (Courtyard 2), 2017 excavations built upon earlier work to further explore a slate workshop/storage area and modifications restricting courtyard access. At Structures 22 and 33 preliminary excavations exposed portions of two Late Classic buildings enclosing a small courtyard atop a platform situated above Courtyard 3. Here we discuss the results of our excavations within the broader framework of Late to Terminal Classic changes in the Maya Lowlands and touch upon numerous questions generated regarding chronology, workshops, production control, building function, access restriction, and the roles of the three different courtyard groups.

Pigott, Michelle (Tulane University)

[255] *It's Not in the Ceramics: 18th Century Apalachee Cultural and Ethnic Identity*

Archaeologists have always made use of ever-abundant ceramic materials as markers for cultural and ethnic identity of past peoples. This works distinctly on the assumption that these identities and their linked ceramic traditions are stable and unchanging; ceramics that do not fit into the expected pattern are often explained away as trade items or the arrival of new ethnic groups. This paper instead argues that ceramics reflect the sequence of ceramic manufacture generated by individual potters whose behaviors reinforce a community of practice, open to change over time through innovation and interaction. A series of detailed ceramic analysis methods were developed to interpret data from four related 17th and 18th century sites, tracking the diaspora and culture change of the Apalachee, a Native American group originally from Northern Florida. In the case of examining the ceramics of post-diaspora Apalachee, these assemblages allow an in-depth study of ceramic practice with the unique advantage of also having substantial historic documents identifying the potters' ethnic identity. With this knowledge, this paper attempts to divorce the unchallenged connection between ceramics and ethnicity and instead encourage interpreting ceramics as a vehicle for culture change.

[206] *Aztecs in the Empire City: The Rise and Fall of Ancient American Art at The Metropolitan Museum of Art, 1877–1914*

With the return of peace after the dislocations of the US Civil War, The Metropolitan Museum of Art was founded in 1870 by businessmen, civic leaders, and artists in New York. Unlike its European counterparts, the institution had no royal collections on which to build. Its ancient American holdings grew through gifts and purchases from diplomats, philanthropists, and collectors. By 1900, with the acquisition of the Petich Collection of some 1500 “Aztec,” and “Toltec” works, The American Archaeologist hailed the Met’s holdings as second only to Mexico City. Yet by 1914, the Museum had turned away from American antiquities, redefining not only itself but also what was considered the appropriate aesthetic purview of an art museum for decades. This paper considers the civic, national, and scholarly currents affecting the collection of ancient American art in the Gilded Age.

[174] *12,500 Years of Altitude*

The earliest occupations in the Salt Puna—a high elevation desert in the Andes Mountains—date to the Pleistocene-Holocene boundary and are relevant to the discussion of the timing of the first exploration and colonization of South American elevations above 3500m, as well as the relationship between mountain environments and other ecological areas. The wooden shafts used in the extractive technologies of the earliest hunter-gatherers originated outside the Puna, in the eastern lowlands. However, the sources of obsidian used for manufacturing projectile points were located at high altitudes in the Puna, between 4000m and 4500m, revealing the existence of adaptations to very high elevations a few millennia after the initial peopling of South America. The implications of these data are broad, as they suggest that early hunter-gatherer groups inhabiting these very high elevations were using resources from far afield and had a good knowledge of the local and regional landscape that extended into adjacent ecological zones located several hundred kilometers away—a familiarity that would have taken several hundred to a few thousand years to develop and possibly enabled them to associate with and rely on neighbors in times of need.

Piperno, Dolores (Smithsonian National Museum of Natural History)

[137] *The Past (and Future?) of Our Crop Plants in Changing Global Environments*

The development of agricultural societies, one of the most transformative events in human and ecological history, began independently in a number of world regions including the American tropics during a period of profound environmental change at the Pleistocene-Holocene transition. Plant domestication is at its core an evolutionary process involving both natural and human selection for traits favorable for harvesting and consumption. Scientists from a number of disciplines have long sought to understand the process of crop plant evolution, but still must rely on imperfect morphological and genetic data based on characteristics of living representatives of crops and wild progenitors in the modern climate, and limited archaeobotanical evidence. Experimental research on living crops and their wild ancestors together with recently developed molecular applications are providing new understandings of, and mechanisms for, domestication and early agriculture. They include phenotypic (developmental) plasticity, a subject of rising importance in evolutionary biology and an oft-neglected concept in domestication research. This talk will discuss multi-year investigations of phenotypic, productivity, and gene expression changes in teosinte and maize when grown under atmospheric CO₂ and temperature conditions that characterized the Late Pleistocene and early Holocene periods, when teosinte was first collected, cultivated, and transformed into maize.

[64] *The Extraordinary Case of the Late Preceramic Norte Chico*

The Late Preceramic Period was a time of dramatic cultural transformations in the Central Andes. At the beginning of the 3rd millennium B.C., at least 30 large, sedentary agricultural settlements with monumental architecture appeared between the Huaura and Fortaleza river valleys in a region known locally as the “Norte Chico” (“Little North”). Since the publication of Moseley’s *The Foundations of Maritime Civilizations* (1975), the north central coast of Peru has been viewed as an exceptional case in global prehistory. Although this precocious development has been a subject of study since that time, research has focused almost exclusively at the site-level. Such a narrow focus has obscured the analytical value of the Norte Chico region as a regional phenomenon. By adopting a broader perspective, I will demonstrate what the Late Preceramic cultural landscape of the Norte Chico region can tell us about social interaction, power relations, and cultural complexity.

[79] *Dr. Dennis J. Stanford: A Legacy of Research in Colorado Paleoindian Archaeology*

I began my graduate studies in 1990, knowing I wanted to learn about the earliest human use of the Colorado Rocky Mountains. It became immediately clear that two decades of work by Dennis Stanford, much conducted with his research- and life-partner Pegi Jodry, contributed myriad bricks to the platform upon which I would construct my own body of work. Stanford’s research at early sites in Colorado spanned the chronological spectrum, from potentially pre-Clovis (Lamb Spring, Dutton and Selby), to Clovis (the Drake Cache), to Folsom (in the San Luis Valley), to Hell Gap (Jones-Miller), to the late Paleoindian Cody Complex (Claypool, Frasca and Nelson). Even more crucially to me, in 1992 he and Jane Day co-edited “Ice Age Hunters of the Rockies,” which immediately became—and remains—my go-to reference for early human use of the Rocky Mountain landscape. Dennis published that book in part to honor the contributions of Marie Wormington and other Denver Museum of Natural History scholars to Paleoindian archaeology generally and Rocky Mountain Paleoindian archaeology specifically. My paper in turn honors the contributions of Dr. Dennis J. Stanford, without whom the research platform that has supported me for two decades would have been shaky indeed.

[121] *Textile Production in the Uruk Period: New Insights from Glyptic Imagery*

Production of textiles rose to an industrial level in the late Uruk period of southern Mesopotamia. Iconographic sources found in glyptic art provide a detailed visual description of aspects of this industry. Gender differentiation is clearly institutionalized, with women preparing the thread and skeins while males are engaged in the actual weaving. This paper presents a close analysis of a single motif in the glyptic iconography, offering an explanation of what has previously been identified as a "spider" motif. Rather than an abstract reference to the production of thread in nature, it is argued that the image is rather a device, a "machine" that was employed to store thread before it was deployed into skeins.

[37] *Uci and Izamal: Influence and Interaction in the Northern Maya Lowlands*

In the Late Preclassic and Classic periods, several sites in the center of the northern Maya lowlands constructed buildings with distinctive megaliths. Izamal was the largest of these sites by far, and connected itself to other important sites with stone causeways that stretched up to 30 km long. Uci, located approximately 35km to the northwest of Izamal, had its own long distance causeway which linked it to three smaller sites with monumental architecture. This paper combines data from two separate, long-running archaeology projects, one focused on Izamal, the other focused on Uci, in order to investigate political, economic, and chronological relations between the two sites. The paper compares Late Preclassic, Protoclassic, and Classic period ceramic assemblages from the two projects in order to document the degree of variation in pottery consumption. Such variation may help determine the extent of economic and political integration between Uci and Izamal, but could also be accounted for by differential access to resources, participation in divergent trade connections, or differences in chronologies of occupation. This paper uses additional lines of evidence to assess the strength of these explanations.

Platz, Lorelei

[263] *Mobility and Pre-Columbian Censers*

Mobility, as it relates to censers, can be discussed on both large and small scales; it includes the movement of iconographic concepts, the physical objects, and the material or organics burned inside the censer. Censers styles fluctuate across pre-Columbian time due to a wide variety of reasons, though the purpose remains the same, which is to burn incense. The singular function of censers makes it an exemplary artefact class for the discussion of mobility across geographical and cultural regions. Here, I draw upon multiple regions to show the continuity of certain design elements across the different cultural regions and time periods. This discussion draws particular attention to the occurrences of the spiked vessel style of censers and the periods of use as they have the strongest iconographical botanical connections. Spiked vessel comparative studies are not new to Mesoamerica and the Maya region; here I continue the discussion further into southern Central America. It is hoped that the macro scale discussion will provide further understanding to the nuances of Potosí Applique from Greater Nicoya.

[68] *Investigating the Reforestation of Anthropogenic Landscapes through Remote Sensing*

While New England is today a mostly forested landscape, up to 80% of this region was deforested during the eighteenth and nineteenth centuries for agricultural land-use. As the rural economy of New England shifted to a more urban and industrial one, much of this agricultural land was abandoned and subsequently reforested. The vestiges of this once rural landscape can now best be seen in LiDAR imagery, in which features such as stonewalls are particularly well discernible. Though the spatial and temporal dimensions of reforestation vary across the region, this paper investigates the extent to which the forest vegetation present today reflects the legacy of land-use evidenced by historical documents and LiDAR imagery. Using these data to precisely identify areas of prior deforestation and intensive land-use, the forest vegetation now present is analyzed through historic CORONA and modern high resolution multispectral satellite imagery to track the progress of reforestation as well as investigate spectral properties that are unique to such areas. In doing so, the legacy of deforestation and abandonment in New England can be better understood, and new tools provided for the study of this landscape in areas where stonewalls are not as frequent or well preserved.

[84] *In Small Organisms Forgotten: Micro-fauna from Shell Middens at Crystal River (8C11) and Roberts Island (8C141) as Potential Proxies for Paleo-climate*

Crystal River (8C11) and Roberts Island (8C141) are neighboring mound and village complexes on the central Gulf Coast of Florida, occupied mainly sequentially across the first millennium AD. Stratigraphic excavations, coupled with extensive radiocarbon dating, permit relatively fine-grained observations regarding the prevalence of fauna over time. Oyster dominates faunal remains from all periods, but higher relative frequencies of small gastropods are evident in Midden Phases 2 and 4. Sponge spicules document a similar pattern. We associate these trends with intervals of warmer and wetter climate, specifically the Roman and Medieval Warm Periods, respectively, as revealed by local pollen samples as well as regional and global climate models. Habitats for small gastropods probably expanded during these intervals, leading to natural increases in species abundance in areas around human habitations, but we suspect the trend may also reflect increased targeting of particular local estuarine resources.

Poister, Nicholas (University of California, Merced), Lilly Buckley Vargas and Holley Moyes

[134] *Fragmentary Ceramic Assemblages as a Record of Ritual Practice at Las Cuevas, Belize*

The most common artifacts found in Maya caves are unslipped and monochrome slipped ceramic sherds. The smashing of ceramic vessels as an element of ritual practice is recorded ethnographically among some twentieth-century Maya groups. Other Maya groups have been documented collecting sherds from domestic middens and depositing them at sacred sites. If caves were venues for the former type of behavior in antiquity, one would expect to find a high percentage of refitting sherds in their assemblages. A lack of consensus exists among scholars as to the prevalence of refitting sherds because these data are rarely provided in reports. The lack of refitting is most acute with unslipped ceramics because, while analysts might spend considerable time attempting to reconstruct a polychrome vessel, few would spend time working with unslipped material. This study seeks new pathways to the decipherment of the cultural processes which led to the formation of ceramic assemblages in Maya caves and is based upon the results of both quantitative and spatial analyses of recently collected data from the Las Cuevas region.

[2] *The Geoarchaeology of Megamammal Survival in the Argentine Pampas*

While most of the South American archaeological sites with extinct megamammals have produced Late Pleistocene ages (12,000 to 10,000 14C years BP), a few locations in the Pampas region have been dated well into the Early Holocene. Among these, Campo Laborde and La Moderna, two kill/scavenging and processing sites in the border of ancient swamps have provided 11 taxon dates (*Megatherium americanum* and *Doedicurus clavicaudatus*) which range between 9730 and 6550 14C years BP. Recent excavations in the Campo Laborde site, as well as detailed geoarchaeological studies and newly obtained amino acid radiocarbon dates, challenge the hypothesis of the Pleistocene megamammals' late survival in this region. In this presentation we will discuss new data considering the site formation processes of creek floodplains in the Pampas, in which the Holocene deposits are biased and the pedogenesis was intense. The studies in both locations suggest that the percolation of organic matter from upper layers would contaminate and rejuvenate the dates obtained from bone collagen.

[133] *Reflections of a Michigan State Graduate's Career in the American West*

I am primarily a western archaeologist and studied under Dr. William Lovis as a graduate student from 1976 to 1979. That was early in Bill's career. I had many mentors in my formative years as an undergraduate and graduate student, as well as early in my archaeology career. Bill was my last academic mentor and the most influential. My training at Michigan State University has influenced my approach to archaeological projects, analysis of site data, and conclusions about such projects. In this paper I describe several projects and experiences in my subsequent work in the Intermountain West as a professional archaeologist where my MSU training and influence was evident and, sometimes, key to decisions and conclusions made.

Pollack, David (Kentucky Archaeological Survey) and A. Gwynn Henderson (Kentucky Archaeological Survey)

[26] *The Middle Ohio Valley Fort Ancient Transformation as Viewed from Fox Farm*

Throughout the middle Ohio Valley, archaeologists have documented ca. A.D. 1400 region-wide changes in material culture and settlement patterns that they have characterized as the Madisonville Horizon. Established ca. A.D. 1300, the three hundred year continuous occupation of Fox Farm, located in northern Kentucky, spans the Fort Ancient transformation (A.D. 1375–1425). As the site grew in size during the fourteenth century, the settlement shifted from a circular to clustered arrangement of structures, to accommodate a larger population. This was accompanied by the development of a distinctive ceramic decorative tradition (deeply incised lines and punctations), coarsely serrated triangular points, chipped limestone discs, and decorated sandstone discoids. By the late fourteenth century house size had increased, shifting from single- to multi-family dwellings. Fox Farm's growth and its establishment as a central place within the Fort Ancient region represents a local response to the volatile cultural landscape of the late fourteenth/early fifteenth century. In this paper, we highlight changes in Fort Ancient material culture and settlement patterns that immediately predate the Madisonville Horizon and consider Fox Farm's role in the development of an emerging regional Fort Ancient social identity.

[25] *Reevaluating Early Bronze Age Masculinities: Skeletal and Mortuary Analysis of Transgenderism at Ostojićevo, Serbia*

The Early Bronze Age (EBA) is often characterized as a period of emerging social hierarchies dominated by high status warrior-males. Analysis of human skeletal remains in their mortuary context has the potential to challenge this assumption and inform more nuanced understandings of gender and social status. Individuals (n=285) at the EBA Maros cemetery at Ostojićevo, Serbia (ca. 1900–1500 B.C.E.) exhibit a strong correlation between biological sex and funerary treatment, specifically body orientation. Among the subset of adult (>18 years-at-death) biological males buried in a "female" orientation, several stand out for either their unique physical characteristics (e.g., tall stature, robusticity), or association with "female" prestige offerings (e.g., copper pins, beaded sashes). The relationship between "masculinity" and social status is further complicated by gendered differences in the social perception and embodiment of physical trauma. While there is an association between trauma, male orientation, and weaponry, most individuals with skeletal evidence of antemortem or perimortem trauma did not receive special funerary treatment. Through the examination of multiple lines of evidence, including grave goods, orientation, and evidence of trauma, this paper argues that transgenderism seems to have been as highly regarded as other elements of traditional "masculine" identities at Ostojićevo.

[337] *From Ritual to Domestic in a Shifting Political Landscape: Excavations in the Coronitas Group at La Corona, Guatemala*

Archaeological and epigraphic evidence from the Coronitas Group at La Corona, Guatemala provides an opportunity to examine responses to changing sociopolitical conditions among the Classic Maya (AD 250–900). Architectural and material evidence suggests that the Coronitas Group was a locus of ritual and ceremonial activities by the royal court throughout the Classic period. Burials of important individuals and other ceremonial activities imply that it was a place of significant ancestral ties. At the end of the Classic period, however, material culture and paleoethnobotanical data indicate that this same area became used for subsistence activities for the first time. During this final phase of occupation, inhabitants of this group commemorated a historical narrative as a response to drastic sociopolitical changes.

[185] *The Bioarchaeology of Diversity: A Case Study in the Roman Empire*

This poster presents a new project to explore migration—the geographic movement of people—and diversity—the intersection of different types of people—in imperial Rome. In Bioanthropology, migration is often perceived in oversimplified terms. Researchers seek to determine if an individual or

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

group migrated, and when in their lifetime this occurred. Furthermore, many scholars treat diversity in equally simplified terms. Traditionally, individuals are assigned to an ancestral population of "best fit," despite claims that this practice is unreliable. Migration and diversity are complex, intertwined elements of the human experience and must be approached in tandem using multidisciplinary methods.

This poster outlines the methods available to examine past migration and identifies ways to incorporate them with evidence of diversity. Scientific approaches, i.e. biodistance and isotopic analyses, will be combined with cultural approaches, i.e. the study of material goods and funerary accounts of diversity, and literary approaches, which document native Roman and migrant opinions. These methods will be applied to case studies from imperial Rome, which was characterized by diverse communities as a result of frequent conquest and large-scale population movements. The outcome will establish if this integrated approach allows for greater insight into the experiences of migrating and host communities.

[262] *Formative Communities of Practice and Disjunctures in Southern Gulf Lowland Interaction with Central Mexico*

Recently Stoner and Pool called for an "Archaeology of Disjuncture" to refocus attention on variation in intra- and interregional interaction, illustrating the approach with the case of the Classic period of the Tuxtla Mountains in southern Veracruz. In this paper I extend application of the disjunctive approach into the Formative Period of the southern Gulf lowlands, focusing primarily on interactions with Central Mexico, and incorporating a Communities of Practice perspective on the formation and disruption of attendant horizon styles. Prominent models of Formative highland-lowland interaction grounded in paradigms of Culture History and World Systems Theory tend to treat the Southern Gulf Lowlands as a unitary entity represented at any point in time by a single pre-eminent Olmec or Epi-Olmec site. Although temporal disruptions in regional settlement systems are widely recognized, economic, political, and stylistic or symbolic interactions are often modeled as a tightly bundled whole. Here I review evidence for significant variation among communities and institutions in the Southern Gulf lowlands with respect to their external relations as a step toward a refined model of interregional interaction in the Formative period.

Pool, Michael (Austin Community College)

[267] *Is There an Early Agricultural Period in the Uplands Mogollon?: Implications of the Chronology at the HO-Bar Site*

Obsidian Hydration and conventional radiocarbon dates at the HO-Bar Site range from 900 B.C. to A.D. 750, partially overlapping dates from nearby Mogollon Village. Perhaps more importantly, these dates are comparable to the Early Agricultural and Early Pithouse Period sites from Southwestern New Mexico. An Early Agricultural occupation has not been established in the Upland Mogollon area in the middle Mimbres River and San Francisco Rivers. The HO-Bar Site dates suggest that there is an Early Agricultural Period occupation in this area, comparable to documented dates in the Lowland Mogollon of southern New Mexico and southern Arizona and the Mountain Mogollon of west-central New Mexico and east-central Arizona. They also have implications for the diffusion of maize agriculture during this time period. Was the diffusion of maize agriculture through contact diffusion from Mesoamerica along a mountain corridor, was it contact diffusion from southern Arizona, or was there a migration of agricultural people from southern Arizona?

[33] *Bricks and Mortar: The Concealed Politicization of Fired Clay Adobe at Comalcalco, Tabasco*

Comalcalco displays a radical departure from traditional Maya building materials in its brick and seashell mortar construction instead of the paradigmatic Maya limestone. Incised animal, architecture, hieroglyph, and human forms adorn the brick slabs of principal buildings of Comalcalco's ceremonial core. However, their inward-facing, or concealed, orientation rendered these markings invisible. Because monumental architecture benefited from the labor of non-elites, the purposeful placement of the incised designs strongly suggests a system of messaging in their invisibility. While Comalcalco occupied a strategic location near the Grijalva River, on the edge of Maya territory, its architectural vaulting resembles that of Palenque, indicating a close relationship between the two sites. In ancient Mesoamerica the invisible or concealed yields great power and consequence; at Comalcalco this lack of visibility may be inextricably tied to its peripheral placement within Palenque's socio-political orbit as well as the greater Maya region. This paper explores several possibilities, none mutually exclusive. Are the incised and concealed bricks of Comalcalco tangible evidence of resistance from those who formed them? From more dominant centers who may have had a role in guiding construction at Comalcalco? Or are they emblematic of a body politic, writ large, which was active within the site?

Porter, Benjamin (University of California, Berkeley), Christopher Hoffman (University of California, Berkeley) and Kea Johnston (University of California, Berkeley)

[172] *Object Photogrammetry at the Phoebe Hearst Museum of Anthropology: Opportunities and Challenges*

The growth in object photogrammetry standards and techniques offers new opportunities for university museums concerned with collections care, research, education, and public engagement. The Phoebe Hearst Museum's global collection of 3.8 million objects spanning two million years and six continents presents an ideal context in which to explore such opportunities and work through interesting challenges. This paper describes how UC Berkeley faculty, staff, and students are collaborating on projects to document key objects in the Hearst's collection. One case-study explores how several Egyptian sarcophagi were documented using structure-from-motion techniques. This work not only created much-needed digital images of these objects for the Museum's accession records, but also facilitated a careful scholarly study of the epigraphic evidence found on each object. These models are also available for use in Berkeley classes. These models as well as others built from the collection's African, South American, and North American collections can be experienced in the Museum's public gallery through the recently installed 3D CAVEkiosk. The paper will describe visitor feedback on the use of the CAVEkiosk and their impressions of the different object models. The paper concludes with a discussion of the opportunities and challenges of conducting photogrammetry work in complex museum collections.

Porter-Lupu, Jennifer (Northwestern University)

[251] *Performing a Queer Aesthetic in Early 20th Century Washington: Preliminary Findings from the Halcyon House Site*

Located in the Georgetown area of Washington, DC, the Halcyon House is one of the only archaeological sites with a documented queer inhabitant. Albert Adsit Clemons, who was purportedly a relation of Mark Twain, lived on the property with a male carpenter, and together the two filled the house with oddities and antiques. In this paper, I will analyze the way that Clemons performed a queer aesthetic through his household décor and personal adornments. Although the site was excavated in 1985, the project lost funding and was never completed. This paper will discuss preliminary findings from two feature deposits related to Clemons, as well as documentary sources. These data and my analysis will expand upon the limited corpus of knowledge about early 20th century queer life in Washington and, more generally, about the way that non-normative sexualities are performed through consumptive choices.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Porth, Erik (Tennessee Valley Archaeological Research)**[81]** *A Re-evaluation of Moundville's Collapse*

The disruption of social traditions in ancient societies is often described as the collapse of complexity, but persisting or resilient practices are often ignored, limiting archaeological interpretations of social continuity and change. This paper addresses these historical processes during the terminal occupation of Moundville, a multiple mound Mississippian civic-ceremonial complex occupied from A.D. 1200–1550 and located in west-central Alabama. The collapse of ancient complex societies has been proposed as a process of rapid disintegration of established practices and the loss of vital resources or sociopolitical institutions that maintained social complexity. Sudden shifts in materiality and monumentality during the fifteenth century at Moundville have been proposed as evidence for the collapse of the political order. This paper reevaluates the timing of these changes through Bayesian modeling of radiocarbon dates from stratigraphic mound midden deposits and revisits changes in the production and consumption of symbolic art and monumental architecture. This paper demonstrates that while some ritual practices at Moundville changed, others were emphasized, supporting a reorganization of the social and political order around highly visible symbols and ritual objects. This newly observed persistence of materiality and monumentality has implications for shifts in the social reproduction observed in other late prehistoric Southeastern societies.

Portman, Katherine, Donna Glowacki (University of Notre Dame) and Kyle Bocinsky (Desert Research Institute)**[226]** *Water Management on the Mesa: The Horseshoe Ridge Reservoir Community and the Occupation of Park Mesa, Colorado*

Water management is a critical concern in the arid landscape of southwest Colorado, particularly for farmers. As such, significant developments in water supply systems—like the construction of reservoirs—reflect the social, political, and economic climates in a community. Three reservoirs are located on Park Mesa in Mesa Verde National Park. These were originally documented during surveys in the 1970s and revisited after the Chapin 5 fire in 1996, but none have been analyzed beyond basic description. In July 2017, two of the largest villages on Park Mesa were re-mapped as a part of the Community Center Reassessment Project, including one apparently centered around the Horseshoe Ridge Reservoir (HRR; 5MV03629). We examine the social and ecological contexts of the HRR community to understand more fully the development and organization of occupation on Park Mesa. We calculate least cost paths and viewsheds in order to help define the extent of the Horseshoe Ridge community and situate it within the broader social landscape. We also evaluate ecological setting, including potential sediment and surface hydrology, to assess the agricultural potential provided by this supposed water catchment feature. We compare the HRR community to other reservoir communities on the Mesa Verde cuesta.

Posadas, Lylliam (Autry Museum of the American West)**[191]** *Discussant***Pothier Bouchard, Genevieve (Université de Montréal), Fabio Negrino (Università degli Studi di Genova), Julien Riel-Salvatore (Université de Montréal) and Pascale Tremblay (Université de Montréal)****[219]** *Zooarchaeological Insights into Modern Human Mobility at Riparo Bombrini*

Human-environmental interactions can be discussed on different scales, and from diverse perspectives and specializations in archaeology. We propose to examine human mobility on the local scale of Riparo Bombrini, a key site in Northwest Italy to understand Anatomically Modern Human dispersals along the Mediterranean coast during the early Upper Paleolithic. Previous studies including spatial, lithic, and raw material data revealed distinct mobility signatures from the site's two Protoaurignacian levels, A1 being warmer and associated with residential mobility when the earliest level A2, directly preceding Heinrich event 4, is colder and associated with logistical mobility showed by a more expedient approach to lithic technology. From this portrait, we suggest that those signatures should be reflected in the faunal data by revealing distinct subsistence, animal acquisition, and carcass processing strategies from both stratigraphic levels. To assess this hypothesis, we present results from taphonomic and archeozoological analyses of faunal assemblages from both Protoaurignacian levels excavated at Riparo Bombrini between 2015 and 2017.

Potter, Ben (University of Alaska Fairbanks)**[127]** *Human Land Use Strategies and Responses to Risk during the Pleistocene–Holocene Transition in Eastern Beringia*

Recent investigations in central Alaska at multiple scales (macro-regional, watershed, site cluster, intrasite) have revealed robust patterning among technological, faunal, and feature datasets. These responses are explored in the context of both regional environmental change associated with climatic oscillations between the Bolling-Allerod, Younger Dryas, and early Holocene chronozones as well as systemic change incorporating more logistical organization, shifts in diet breadth, and changes in seasonal mobility and habitat use. I track system-wide changes in the development of communal hunting, increased storage dependence, and increased social interaction in the Holocene. However, resilience in the earlier system allowed for relatively minor changes to accommodate major climate shifts (and resulting resource variability).

Potter, Ben [182] see Reuther, Joshua

Pottier, Christophe (Ecole française d'Extrême-Orient (EFEO))**[175]** *The Challenge of the Grid: A Conceptual Frontier in Angkor?*

For a quarter of a century, the concepts of an open city and a low density urban megalopolis have largely broadened our understanding of Angkor (Cambodia), which was based on the morpho-chronological vision of a succession of perfectly geometric walled cities. As the researches progressed, the identification of the elements that make up the archaeological landscape of the Great Angkor has been developed, mixing temples, palaces, settlements, reservoirs, road networks, hydraulic systems and agricultural parcels. The texture of the urban fabric now appears in its complexity, and underlines the omnipresence of geometry and, in particular, of the grid as a vector of spatial planning and a tool of a centralized state power. The presentation will focus on exploring this theme based on the region of the western baray in Angkor where recent research revealed the remains of the first Angkorian capital in one of the last unexplored areas of Angkor.

Poulos, Anastasia**[251]** *In the Face of the Flood: A County's Efforts to Mitigate the Potential for a Massive Loss of Cultural Resources*

Coastal erosion is impacting Anne Arundel County, Maryland in a way that is extreme and remarkable with a rate of sea level rise nearly twice the global average. Historic properties and archaeological sites are at risk of inundation on the County's shorelines. Anne Arundel County Trust for Preservation has received a cultural resources hazard mitigation grant through the National Park Service's Hurricane Sandy Disaster Relief Fund (administered by the Maryland Historical Trust) and is partnering with Anne Arundel County's Cultural Resources Division to identify, evaluate, and document imminently threatened archaeological and historic sites in the County that are in the high-risk flood zones in Pasadena, Jessup/Laurel/Maryland City, and Shady Side. This paper discusses the field and research methodology employed for assessing a massive number of historic resources and archaeological sites at high risk of inundation. This project demonstrates the value of a united team effort in facing the challenge of undertaking a large survey area, the benefits of developing a collaboration across disciplines, the use of a GIS database to prioritize cultural

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

resources and the importance of both assessing and inventorying coastal sites endangered from natural hazards in order to mitigate the potential loss of these sites.

[256] *Buildings from the Ground Up: Early Maya Architectural and Settlement Practices at the Belize Valley Site of Pacbitun, Belize*
Archaeological research in the Upper Belize River Valley has recently produced information that dramatically improves our knowledge of the earliest Maya. Investigations, particularly at the site of Pacbitun, has revealed evidence of radiometrically and ceramically dated cultural stratigraphic deposits for the early and late Middle Preclassic subperiods (900–300 BC). Excavations were undertaken in the site core, principally Plazas A and B, to determine the nature and extent of these communities as well as to gather data on their spatial organization and population size. By combining settlement data with excavated architectural remains and ceramic assemblages, this paper will examine the timing and structure of initial occupation through increased social complexity by the 4th millennium BC. The excavation of several residential buildings, craft production areas, and a large ceremonial platform has provided significant new insights into the increasing diversification, complexity, and ceremonial/ritual importance of the buildings utilized by the residents of Pacbitun. A comparison of results with other valley sites and elsewhere in the central Maya lowlands will also be provided.

[17] *Initial Period Friezes and Architecture at Taukachi-Konkan, Casma Valley, Peru*
Recent excavations at a number of intermediate-sized mounds of the Initial Period (2100–1000 B.C.) site of Taukachi-Konkán in the Casma Valley of Peru have uncovered surprising new evidence of clay friezes and architectural forms previously unknown for the Initial Period along the coast of Peru. One U-shaped mound complex has an associated sunken rectangular plaza that contains distinct friezes on all four of its sides. The content of the friezes includes two sea lions, a large feline and two possible avian beings that most likely reflect the cosmology of the builders of the site. The mound itself has an asymmetrical access pattern that is unique among Initial Period mounds that normally have symmetrical layouts and direct access routes. Architecture on the north wing structure housed ritual activities as well as living quarters for personnel who maintained the ritual mound complex.

Praet, Estelle (Estelle Praet ULB-MEARAP)

[190] *Early Monumental Architecture in Peru: Sunken Circular Plazas from the Late Archaic (5000–2600 B.C.) to the Final Formative (400–200 B.C.)*

We hereby focus on a feature of monumental architecture in north and central Peru from the Late Archaic (5000–2600 B.C.) to the Final Formative (400–200 B.C.) respectively illustrated by the sites of Sechín Bajo and Pallka both located in the Casma Valley. This specific feature is the sunken circular plaza (SCP), a public-oriented sunken space whose circular shape runs from 1,5 m to 80 m, as the most extreme examples. Through the record and description of 64 sites—some of them contained several SCP-, we intended to understand the characteristics of SCP. Indeed, those structures vary in terms of building materials, capacity, centrality and space syntax. Besides, sites patterns presenting SCP are very diverse, which led to the establishment of a typology. This record enabled us to approach SCP diffusion through time and space. While focusing on the most documented sites, we also attempted to pinpoint specific functions associated to processions, gatherings and ritual activities.

Pratt, Jordan (Texas A&M University) and Ted Goebel (Texas A&M University)

[155] *Exploring the Age of Western Stemmed Points at the Nials Site, Harney Basin, Oregon*

First American archaeologists are increasingly interested in the relationship between Western stemmed point technology (WST) and other Paleoindian lithic technologies, including Clovis. While there is some evidence of WST dating as early as 14,000 14C years before present, most sites lack reliable geoarchaeological and geochronological evidence. In the late 1990s and early 2000s the University of Nevada Reno excavated several stratified open-air WST sites in Oregon along the southern shoreline of Harney Lake, including the Weed Lake Ditch, Biting Fly, and Nials sites. The research presented here focuses on Nials (35HA2828), from which over 33,000 debitage pieces and 76 stone tools, including two crescents and five stemmed points, were recovered in situ. Initial attempts to radiocarbon date the cultural layer failed, therefore the Center for the Study of the First Americans returned to the site in 2017 with the goal of establishing its age, as well as describing and interpreting the geoarchaeological and lithic materials. This recent excavation recovered further lithic and faunal samples, as well as materials for both AMS Radiocarbon and optically stimulated luminescence dating. Additionally, lithic technological attributes and ArcGIS 3D Analyst were utilized in analysis, allowing us to more clearly understand WST in Oregon.

[324] *From the Ashes: Volcanic Construction Materials in Pre-Columbian Ecuador*

In many ways, volcanic eruptions define the pre-Columbian history of highland Ecuador: the shaping of the landscape, migration patterns, mythology, and ideology. Ecuador is one of the most volcanically active countries on earth, and it's impossible to examine the archaeology without considering both the direct and indirect impacts of volcanic eruptions. Through millennia, the imposing presence of the volcanos on the northern Ecuadorian landscape inspired fear and veneration, with the ever-present threat of disaster the price of life-giving sources of water. With a paucity of other hard stone, volcanic materials found in the region, ranging from fine powdery ignimbritic ash from Quilotoa volcano to dense cangahua, a consolidated volcanic ash, have been utilized for a variety of purposes in pre-Columbian cultures all over northern highland Ecuador. This paper examines some of the functional and ritual uses of volcanic materials at pre-Columbian sites from different periods across the northern highlands in order to better understand how ancient people conceptualized these destructive but life-giving forces of nature.

[327] *The New Pragmatism: Archaeological Encounters and Entanglements*

In 2010, Steve Mrozowski and I proposed a "new pragmatism" as a way for archaeology to cut the Gordian knot of endless theory debates. We argued that this movement or spirit does not refer to the dominance of any one approach or theory, but rather to the more explicit integration of archeology and its social contact in ways that serve contemporary human needs. In my contribution, I example the relevance of some of the insights of Richard Rorty and Jurgen Habermas in developing a pragmatic archaeology.

Prevedorou, Eleanna (Wiener Laboratory ASCSA & Arizona State University)

[298] *Unwritten Histories: The People of the Phaleron Cemetery*

Ancient Athens is cited as the contentious caldron from which the western political tradition emerged. During the formative Archaic period (ca. 700–480 BC), Athenian history was marked by major political developments (e.g., early law codification, citizenship formalization), social stratification (e.g., classes), and conflict (e.g., tyrants). To date, such processes are known to us through texts, artistic representations, and elite-centered mortuary grounds. The collaborative Phaleron Bioarchaeological Project integrates a wide range of biological, mortuary, and historical data with scientific methodologies to elucidate the ancient lives of the commoners that remain unexplored or silenced. This project focuses upon the extensive necropolis excavated at the ancient Attic port of Phaleron (ca. 8th-4th centuries BC) by the Ephorate of Antiquities of Western Attica, Piraeus, and the Islands. The size, date, state-of-the-art excavation techniques, preservation, and mortuary variation of the cemetery including, among others, what appears to be non-elite strata, as well as mass graves and shackled individuals offer us with a previously undocumented view of the ancient Athenian past. Here, we discuss preliminary bioarchaeological results and we present a contextualized and synthesized approach to reconstruct life and death in Archaic Athens.

[103] *Tracking Morphological Changes in the Domestication of Sheep and Pigs: A Comparison*

How do animal morphologies change during domestication? How do different parts of the skeleton adapt to human management? In this poster, I take a quantitative approach to domestication by comparing biometrical data from two species of mammals that were domesticated in the Middle East around the same time (ca. 8000 BC): pigs (*Sus scrofa*) and sheep (*Ovis aries*). Both pigs and sheep were domesticated by Pre-Pottery Neolithic B communities in northern Syria/southern Anatolia, but these species likely followed different pathways to domestication as a result of their divergent behavioral and physiological properties. Using modern comparative biometrical data to guide the comparison, this poster tracks changes in cranial and postcranial measurements over time, covering the periods before and after domestication. By quantifying biometrical change across the skeletons of these two different species, this poster ultimately looks at mammal domestication as a process of unique adaptation to human cultural control.

[74] *Bayesian Reconstruction of Past Demography*

I describe a novel, age-structured, Bayesian framework for reconstructing past demography. The framework is quite flexible and can incorporate and synthesize a wide range of data. I demonstrate its use with human burial data, where each observation can include an AMS radiocarbon measurement, an estimate of age-at-death, or both. Conceptually, the framework is useful because it addresses in a statistically principled way two vexing sources of equifinality in archaeological data: (1) the radiocarbon calibration curve and (2) the fact that even if demographic rates such as age-specific mortality, fertility, and migration are stable an infinite set of demographic histories can yield the same predicted growth rate and stable age distribution. Fortunately, not all demographic histories are equally likely and some are even impossible. I utilize theoretical and empirical knowledge from evolutionary demography and life history theory to parameterize and specify prior probabilities for alternative demographic histories. The radiocarbon and age-at-death data update these prior probabilities to give posterior probabilities, yielding a (hopefully) sensible and accurate reconstruction of past demography.

Price, Robyn (University of California, Los Angeles)

[309] *The Invisibility of Experience: Accessing Ancient Sensory Frameworks*

While archaeological analyses that focus on the experiential and sensorial past are becoming more common, scholars continue to discuss and dispute what knowledge of the past is accessible. Without moving beyond the material remains and into the realm of the self-reflexive researcher (Hamilakis 2013: 119), this paper will demonstrate that archaeologists do not need to stray too far from their traditional methods to uncover rich evidence of past sensory lives. By drawing from the field of art history and linguistics, the elaborate depictions of tomb scenes from Eighteenth dynasty Egypt might truly come to life as evidence for an ancient sensory framework. In addition, these tomb scenes were not designed for the dead, but also engaged with by the living. Though these scenes were augmented by their inclusion of deceased people and other such occurrences not commonly visible to the living, the activities depicted such as banqueting or hunting were those experienced by ancient Egyptians every day. How might the visible representations of invisible sensory experiences in these scenes be reconciled with the daily life of the ancient Egyptians? This paper seeks to understand this relationship with special emphasis on the visibility of the senses and the invisibility of experience.

[71] *Abu Shusha: Integrating and Correlating Surface Features with Magnetic Susceptibility*

This research looks at Tel Abu Shusha in the Jezreel Valley of Israel, an understudied site in a strategically important Levantine area with potential evidence of Roman, Byzantine, and Ottoman settlements. Surface survey was completed in nine square kilometers around the Tel, resulting in ceramic density data as well as over 2,500 mapped surface features in GIS, such as quarries, wine presses, and architecture. Additionally, four magnetic susceptibility grids were taken in this area, each one measuring approximately 100 by 100 meters. These grids were intentionally completely in varying

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

topography that often creates difficulty for geophysical survey: on top of a Tel, on a Tel slope, in a hilly forested area, and in a flatter forested area. This project, a Master's Thesis at the University of Arkansas, looks at settlement patterns and site formation processes through the integration of these two data sets and exploration of visual versus quantitative methods of display, as well as the relevance of maps derived from elevation. Global and local correlation as well as other spatial statistics were used to compare these data sets, particularly looking at how well certain feature types align with susceptibility values and what we can generalize from this.

[72] *Research Protocols for Documenting Hopi Traditional Properties*

Over millennia, Hopi people have established a rich landscape of significant places throughout the American Southwest and beyond. The significance of many of these places is rooted in Hopi traditional beliefs and practices and they are vital components to the cultural identity of the tribe. The Hopi Cultural Preservation Office (HCPO) and their research partners have established protocols for documenting Hopi traditional cultural places and incorporating this information into the regulatory framework of the National Historic Preservation Act. To this end, established protocols include: identifying appropriate research participants to help identify traditional cultural properties and their contexts of significance; completing place-based research to identify all contributing elements of the property; following best practices in documentation, review, and confidentiality of cultural information. Recent research conducted by the HCPO and Anthropological Research, LLC, identified Hopi traditional cultural properties within the Navajo Generating Station and Kayenta Mine Complex, centered on Black Mesa in northeastern Arizona. This research helped to refine established protocols and illuminate continued challenges associated with documenting Hopi traditional cultural properties.

Prieto, Gabriel

[165] *Continuities and Discontinuities in a Thousand Year Old Fishing Village on Huanchaco Bay, North Coast of Peru: The Pampa la Cruz Case*
Traditionally, Andean archaeologists label residential settlements as "Salinar" or "Moche" and automatically assumed they "belong" to a particular society/culture. Since 2010, I have been excavating multiple sites around Huanchaco bay, located in the littoral of the Moche Valley, North Coast of Peru. One particularity of this coastline is that there is still an active group of fishermen exploiting the sea resources using traditional technology. The continuity between the earliest occupation identified in this area (B.C. 1500–1200) and the present day fishermen is giving us a new perspective for exploring the social, economic and ideological trajectories of the Huanchaco community. In short, instead of framing archaeological occupations as Salinar or Moche, I propose a "Huanchaco identity" created over time by their economic and ideological relationship with the ocean. To explore this possibility, I present the case of Pampa la Cruz, first occupied around B.C. 350/300 and abandoned roughly at 650/700 A.D. This occupation lasted for more than one thousand years in which this domestic settlement experienced several changes but also continuities in spatial organization and material culture. This paper presents the history of a fishing community and their co-existence with major social, political and ideological movements through time.

[136] *The Vital Force of Underground Places and Ritual Production in Caves and Rockshelters*

Caves are regularly portrayed as a blank stage upon which the social—including ritual activity—is enacted. This paper, however, takes the opposite approach: in discussing a number of selected Antique and Medieval ritual cave sites in Slovenia that are associated with Roman, Christian and Slavic religious systems, it demonstrates the vibrant, hybrid, participant and continuously-changing nature of underground places in which multiple symmetric and fluid connections exist between people, animals, plants, materials, things, places and landscapes. Most notably, these throbbing networks of various human and non-human agencies cooperate or are in conflict, and enhance or confound each other; yet, at the same time, also act as a whole with a vital force that is distinct from the sum of each materiality considered alone, and which can thus be understood not only as a distinct place-power, but also as the core essence of any ritual performance.

[229] *Changing Times, Changing Ways? Evidence for Metallurgy at the Cividade de Bagunte*

The Iberian Peninsula has been a rich source of metallic ores for millennia, and the quest for control of those resources has profoundly impacted the history of the Peninsula. Iberia has followed a unique trajectory in the development of metallurgy, with a case for the independent invention of copper smelting in the southwest, and small-scale production of bronze and other metals across the Peninsula until Roman occupation. The advent of Roman imperial control of labour and mines constituted a sea change in the scale and intensity of metal exploitation in Iberia with the introduction of large-scale mining, smelting, and production operations. What did this change look like within communities? How did local people adopt, adapt, or reject these new technologies and practices? Among the last to be conquered, the people of the Castro Culture of northwest Iberia produced some of the most technologically complex and visually stunning examples of Iberian metalwork. However little is known about the nature of metallurgy practiced at Castro sites. The Cividade de Bagunte, at the height of its occupation during the Roman period, can provide valuable insight into the social and technological strategies used by Castro people to cope with this transition.

[88] *Post-mortem Interval and Age-at-Death Estimation through Forensic Proteomics*

The estimation of the post-mortem interval (PMI) and the age-at-death (AAD) are both important aspects of forensic anthropology for which numerous methods have been developed, each with different limitations.

As proteins represent biomolecules that carry out a wide range of functions, many of which structural to the tissues undergoing decomposition, and the collection of these (i.e., the proteome) is dynamic not only throughout life, but also post-mortem, proteomic methods have great potential in forensic

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

archaeology.

Here we present the innovative use of proteomics to investigate AAD from pig bones of different biological ages collected from an experimental forensic scenario. Furthermore, we explored the proteome variability of bones extracted from pigs that have been buried for different PMIs, to better understand the leaching phenomena associated with taphonomic events as well as the decay of proteins post-mortem. Our results showed relationships between the abundance of particular serum proteins with AAD, and glutamine deamidation with PMI, revealing the suitability of proteomics to forensic contexts.

Proebsting, Eric (Thomas Jefferson's Poplar Forest) and Daniel Druckenbrod (Rider University)

[39] *Forest, Frost, and Agriculture: Measuring Three Centuries of Environmental Change at Thomas Jefferson's Poplar Forest*

This paper highlights ecological discoveries made during a survey of natural and cultural resources along a new 2.2 mile parkway at Thomas Jefferson's Poplar Forest. Poplar Forest is Thomas Jefferson's former retreat home and plantation located in Bedford County, Virginia. In addition to locating archaeological sites and mapping aboveground features, 10 forest plots were established within stands of increasing age adjacent to the proposed path of the parkway. By measuring tree diameter, identifying tree species, and using dendrochronology to sample trees from three different positions in the forest canopy, these plots are providing interpretations about how the present day landscape relates to past agricultural activities, landscape design, and processes of succession that have taken place over the past 250 years. Additional insights are gained by examining these plots in light of historic documents and maps as well as archaeological remains, including charcoal fragments recovered from the plantation's slave quarters and pollen profiles associated with the creation of both agricultural fields and Jefferson's retreat. Samples taken from plantation-era building timbers and tulip poplar trees associated with the ornamental landscape are also being used to extend our knowledge of significant climatic events and forest dynamics back to the decades before colonial settlement.

Prout, Michael (CSULA Anthropology Master of Arts)

[157] *Primary or Secondary Deposition: Midnight Terror Cave Operation V*

Two chambers in Midnight Terror Cave, Belize show undeniable evidence of Maya child sacrifice. Operation V and Operation VIII are the deepest darkest chambers of the cave where some of the most important of ancient Maya rites were performed including human sacrifice. In 2009 Ann Scott proposed that sacrifices occurred in Operation VIII and, during ritual cleaning of this public space in preparation for a new ceremony, the bones were taken from their primary deposition site and moved to Operation V. This paper analyzes the presence of small hand and foot bones in each chamber to determine primary or secondary deposition. The data agree with Scott's secondary deposition model.

Prufer, Keith M. (University of New Mexico), Mark Robinson (Exeter University) and Douglas J. Kennett (Pennsylvania State University)

[59] *Early Human Biology, Ecology, and Archaeology in the Lowland Tropics of Central America*

Renewed focus on Paleoamerican and archaic peoples across Mesoamerica have broadened our understanding of those time periods. However, few stratified sites have been documented. We present new data from two multi-component rockshelters located in the Bladen Nature Reserve in the Maya Mountains of Belize. We document persistent use of these rockshelters from the late Pleistocene through the Maya collapse and suggest these spaces were used for animal processing, tool reduction, and as cemeteries. These sites are very difficult to access and are located more than 40km from the nearest road. Their location, in a well-protected environmental preserve, has allowed us to excavate undisturbed contexts in dry shelters that have fostered remarkable preservation of organic materials. Here we present data from human biology, isotope ecology and material culture. The results contribute to our understanding of early human adaptations in the New World.

[216] *Women's Power and Prestige in the Pre-Hispanic and Early Colonial Andes*

The second half of the first millennium A.D. witnessed some significant changes in gender roles and traditions in the Andes. The discovery of the first undisturbed burial context of fifty-eight noblewomen with hundreds of precious artifacts found at Castillo de Huarmey provides important evidence about women and their roles played in ancient society in the Wari Empire. The amount and the richness of the luxury and prestige items, which comprise hundreds of objects of the most diversified types, provide important data regarding the identity of elite women and their social and economic role during the Middle Horizon. Many of these ancient traditions have persisted in the early colonial period. That refers especially to the elite women's personal attire, as well as jewelry, ritual accessories and others objects of prestige collected during their lifetime. Early colonial documentation, particularly the wills of indigenous elite women, compared with archaeological evidence, confirms that both female attire and personal grave goods imitated the symbolic image of the queens and princesses of antiquity, just like those from the mausoleum of Castillo de Huarmey. The information collected up to date allows also to analyze different goods of indigenous origin through their strategic and economic value over time.

[313] *The Challenges of Co-authoring a Background Chapter for an Open Textbook*

As we move towards increasing open access to archaeological knowledge, textbooks are an integral part of that transition. Unfortunately, open access textbooks are not a well-established form of knowledge dissemination amongst archaeologists and currently do not hold as much credibility as traditionally published works such as peer reviewed journals or printed textbooks. In hopes of contributing a chapter to an open access textbook, what are the keys to making such a background chapter successful? What elements are necessary to prove that such a chapter has validity in the eyes of archaeologists but also leverages the benefits of an open source textbook? What traditional textbook themes are required and what others should be left aside to improve the way that textbooks can be used to pass on background knowledge to new students? This paper aims to discuss some of those specifics to create a solid foundation for co-authoring a chapter for an open source textbook. It will examine the necessities as well as discuss innovative ideas for working on a large collaborative project.

[244] *Revealing the Drowned Past: New Evidence for Buried Underwater Landforms in Walker Lake, NV*

Over the last 15,000 years, Walker Lake, NV has ranged in size from the southernmost branch of Pleistocene Lake Lahontan to a small alkali wetland. These conditions have provided valuable, but varied resources for local populations throughout human occupation. Sites identified during summer 2015 and 2016 illustrate the preservation of sites in environments where both submersion and drying have occurred. Investigations during summer 2017 revealed the presence of numerous landforms under the modern lake. Sub-Bottom survey showed preserved features including shorelines,

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

buried channels, and possible rivulets. Underwater test excavations on these features demonstrated their preservation under more than 2 meters of sediment. Marker horizons and preserved organics provide valuable guides for future research such as depositional chronology, potential for preserved perishable materials, and ideal locations for extensive excavations. When combined with the new archaeological sites found north of Walker Lake, the results clearly demonstrate the value of underwater archaeological research in the Walker Lake Basin.

[252] *New Data on City Planning at Nixtun-Ch'ich', Petén, Guatemala*

The site of Nixtun-Ch'ich' in Petén, Guatemala is the only known lowland Maya site with an urban grid. Such grids are composed of perpendicular streets forming quadrilateral city blocks. They are common elements of city planning as they increase the legibility of city space and the interconnectivity of occupants. The urban grid at Nixtun-Ch'ich' is the earliest known in the Americas (ca. 800–500 BCE) and was built when social complexity was emerging in the Maya region. Like many Preclassic period Maya sites, the planning at Nixtun-Ch'ich' also includes an east to west line of ceremonial buildings and reservoirs forming an axis urbis. Our latest survey has revealed that the axis urbis extends much further to the east and west than previously thought. Recent excavations and radiocarbon assays have refined the chronology of the grid construction as well as the axis urbis. The work has also illuminated Middle Preclassic period construction techniques.

[69] *Monte Castelo Shellmound and Early Ceramic Technologies in Amazon: A Perspective on Long-Term Landscape Management and the Origins of Pottery in the Americas*

Recent research has confirmed that some of the oldest ceramics of the Americas are associated with Amazonian shellmounds. Excavations at Monte Castelo site produced a representative assemblage of these early technologies, and has also demonstrated a long history of ceramic production and use, with significant changes during the Middle Holocene that accompany the intensification of landscape management and the emergence of several other cultural innovations in that period. In this presentation, we will bring the results of geochemical analyses carried out on pottery remains and sediments from different strata of the site as well as from off-site areas, correlating its chronology with the paleoenvironmental scenario of southwestern Amazonia. In an attempt to contribute to the discussions about the characteristics of the emergence and the adoption of ceramic technology, some indications of its relation with the early process of landscape management that are marked in the history of occupation of the region will be further presented.

[169] *Tarascan Presence in Central South Michoacan. New Researches*

For the last five years the Instituto Nacional de Antropología e Historia set up an archaeological project in the central south portion of the state of Michoacan in the Zirahuén and Balsas river basins. A systematic survey had been made in a large area identifying dozens of sites never previously recorded, some of them with a clear Tarascan component. In spite of, in this paper we will present the results of the research made at the Tarascan sites in the limits of the highlands and the Tierra Caliente and the expansion of the Señorío Tarasco into the lowlands of the Balsas River. This particularly related to the Tarascan exploitation of the natural resources of the Tierra Caliente like cotton, colored stones and especially the copper mines.

[269] *The Wupatki Petroglyph Project*

The Museum of Northern Arizona and National Park Service, Flagstaff Area National Monuments conducted a cooperative baseline documentation and condition assessment of four sites in Wupatki National Monument 2014–2017: Crack-in-Rock (WS831), Middle Mesa (WS833), Horseshoe Mesa (WS834), and WS835. The fieldwork component of the project comprised high resolution film and digital photography of 374 petroglyph panels and 4,004 elements, completion of narrative and tabular data collection forms for all panels and elements, and evaluation of the geomorphological settings of the petroglyphs. Additionally, selected panels were documented with scaled drawings, gigapixel panoramas, timelapse digital photography and video. The project significantly expanded the number of recorded panels and elements, identified differences in the types of elements represented at each site, re-evaluated previous claims for solar imaging calendars, and revealed previously unknown or under-reported Archaic and Historic occupations of the sites.

[287] *Complicating the Religious/Secular Dichotomy through Object Biographies: An Investigation of Mesa Verde Style Mugs*

Scholars acknowledge that religious and secular rituals are difficult to distinguish. This is especially true in the archaeological record, where human beliefs and worldviews must be understood through material correlates. In order to make categories simpler to use, Western scholars have tended to dichotomize religious and secular. Exploring the role of Mesa Verde style mugs in the Ancestral Puebloan world, this paper takes an object biography approach and acknowledges that boundaries between religious and secular practices are not always clear cut. Researchers tend to consider Mesa Verde style mugs an object used primarily in religious ritual contexts. However, their investigations have assumed an unnecessary dichotomy between domestic/secular and religious/ceremonial uses. By using an object biography approach, I work to collapse the boundaries between religious and secular practices and show that mugs had multiple roles in the lives of Ancestral Puebloan people.

[110] *The Postclassic, the Postmodern, and the Problem of Alternative Facts*

Contemporary trends in mass media communication indicate serious confusion in the public consciousness about the nature of science and the status of evidential reasoning. Archaeologists, in an effort to make esoteric research programs interesting to the public have contributed to this problem by providing over-simplified stories and “lessons from the past” based on sketchy evidence and mystified analysis. We have allowed public intellectuals from other disciplines to speak for us, and we have failed to address the dangerous gap between what we were saying about the past from what the public was learning about the past. But the past has important implications for the future of archaeology as a discipline, especially if we continue to oversimplify what we know about the ramifications of sociopolitical change for the future of the planet.

[221] *Assessing Malaria Risk in 19th Century Tucson, Arizona*

Malaria is thought to have been brought to the Americas by early Spanish explorers. By the late 19th century, malaria had spread through human populations throughout tropical and temperate areas of the Americas, including the American Southwest. Historical documents, maps, and modern GIS data layers (e.g., DEM, soils, vegetation, land use, streams) from the area around Tucson, Arizona, were consulted and entered into ArcGIS (v.10) in order to produce a map of potential vector breeding locations based on a flood water accumulation model. The ArcGIS model and subsequent statistical analyses revealed that nearly the entire Tucson Basin would have been at high risk for malaria transmission, but historical records suggest that malaria differentially targeted certain demographics. Why? This research attempts to tell the story of how cultural and social practices interact with environmental patterns of climate and vector distribution to determine risk of malaria transmission in Tucson.

[302] *Identifying Patterns of Ceramic Compositional Variability from Residential Contexts in Three Late Classic Maya Polities*

Archaeologists have had a long-standing interest in domestic economy because households are often considered to be the primary social unit of production, consumption, and reproduction in most agrarian societies and occupy an important place in the study of ancient state economies. A relatively novel avenue for exploring broader patterns in the domestic economies of ancient Maya polities involves compositional analysis of ceramics. Variability in the compositional makeup of the ceramics can show variability in clay source procurement, which could help identify manufacturing groups and the circulation of ceramics between households. A comparative perspective between different Classic Maya polities will provide a way of discerning concrete patterns of variability. With this in mind, this study explores the composition of Late Classic ceramics from three Maya polities in the Belize River Valley, Baking Pot, Cahal Pech and Lower Dover. These are among the largest Maya polities in the upper Belize River Valley and served as the capitals to small kingdoms in the Classic period (c. AD 250–900). The results will speak to inter-polity differences in ceramic production and distribution at the household level.

[207] *Camelid Herding and Enduring Community Identities among the Ayarmacas (Cuzco, Peru)*

Indiscriminate invocation of the term ayllu constrains archaeological reconstructions of community organization in the pre-contact Andean highlands. Legacies of earlier generations of anthropological scholarship encourage researchers to assume particular traits of sociopolitical organization. Archaeological and ethnohistoric evidence from the Cuzco region of Peru demonstrates how such assumptions can be an obstacle to developing accurate representations of social organization. As Inca elites extended power in the Cuzco region (AD 1200–1400), they interacted with diverse societies that did not all resemble the monolithic Andean ayllu. One compelling case for reconsidering ayllu organization is Yunkaray, seat of the powerful Ayarmaca polity, located near Maras, 35 km northwest of Cuzco.

This paper uses ethnohistory, regional settlement patterns, and excavation results from Yunkaray to note divergences from classic ayllu attributes. We identify camelid herding as a potentially integrative force in pre-Inca community formation, and examine the public performance of community identity in relation to Yunkaray’s neighboring polities. We trace the enduring Yunkaray community through its sociopolitical apogee and the subsequent forced resettlement of its residents by the Incas. Finally, we consider how the imagined community of Ayarmacas relates to local ayllus that coalesced in the early Colonial period, especially through processes of Spanish resettlement.

[40] *A New Method for Monitoring Socio-economic Changes through Settlement Placement*

There is a recursive relationship between socio-economic institutions and the environment. Decisions about where to place settlements in a landscape were informed by existing economic institutions, but placement of sites in turn effected how social and economic institutions were organized. In this paper, I present a new GIS-based method for quantifying socio-economic organization and change in prehistoric societies. Catchment analyses, as employed in this study, define the availability of economic resources for individual settlements. This approach then quantifies cultural preferences across settlement systems. As a case study, I monitor settlement systems throughout the Early and Middle Bronze Age in southwest Transylvania. Southwest Transylvania is a major metal producing region that underwent significant socio-economic changes as metal became commodified throughout the European Bronze Age. Using catchment analysis, I demonstrate that communities in metal-rich landscapes increasingly prioritized access to agricultural land and access to interregional trade routes over metal ore sources. This result challenges existing narratives for how increasingly complex societies emerged in late prehistoric Europe. The method presented in this paper is easily transferable to other regional contexts and can be an additional tool for archaeologists exploring socio-economic organization and change in the past.

[57] *19th Century Factories, Warehouses and Workshops in La Puntilla, San Juan Puerto Rico*

La Puntilla-Marina is a small peninsula located south of the walled city of San Juan, Puerto Rico, and west of the docks. Through the 19th century a series of projects to develop the area, consisting on the construction of colonial government buildings such as the custom's house, armory and a military battery, as well as warehouses and dwellings, were completed. Unfortunately, part of this ward was demolished in in the mid-20th century to give way to the construction of residential units, a large plot of land was converted into a parking lot, and an US Coast Guard Base was established. This study concentrates on creating a chronological timeline of the development of the ward by identifying the factories, warehouses and workshops that were established in this peninsula in the 1800s. Documentary resources like maps, blueprints, photographs, commercial directories and newspaper ads were used to locate these properties and create a virtual map. The main goal is to identify potential archeological research areas for future studies

Quintela, Daniel

[186] *The Lithics of Late Coalition Period Tewa Pueblos: Negotiating Tewa Society in the Rio Chama Valley*

In Ohkay Owingeh's origin tradition the Tewa peoples emerged into this world from the north and traveled south as two separate groups—the Summer and Winter people—before coming together to create a new society in the Rio Chama valley of northern New Mexico. This history parallels our archaeological understanding of diverse peoples, likely migrants from the Mesa Verde region and indigenous Rio Grande populations, who settled the Chama in the thirteenth and fourteenth centuries. However, the origin and identities of these people, as well as how they interacted and negotiated Tewa society, remains poorly understood. I address this issue by comparing two contemporaneous ancestral Tewa pueblos: Palisade Ruin and Tsiping'uinge. Although located only 8 km apart and both built in A.D. 1312, these sites differ greatly in size and architecture and raise questions of the identities of their inhabitants and relationships with one another. I specifically examine the procurement of lithic artifacts. Based on frequencies of materials these villages had different access to local and imported stone, and may have participated in independent socioeconomic networks. This suggests an agreement between archaeological data and the Tewa's own history that Tewa society is an amalgamation of many diverse peoples.

[171] *Examining the Impacts of Non-human Animals on Sequences of Agricultural Change*

Historical sequences of agricultural change are influenced by several key factors. While much attention has been paid to the political context of agricultural production, as well as environmental changes brought about by certain techniques, less has been paid to the active manipulation of productive environments by non-human animals. Within the context of some recent theoretical advances in archaeology and ecology, it has become apparent that animals—intentionally or unintentionally introduced by humans—modify the context under which agricultural production occurs. These modified landscapes are inherited by subsequent generations of producers who are challenged to make minor, and sometimes major, adjustments based on changing landscapes. In this paper, we highlight these processes using case studies from historic North America (e.g., earthworms) and the pre-European Pacific (e.g., rats and birds). We demonstrate that the ecosystem modifications and services provided by animals created a particular kind of path dependency that had ramifications for past peoples, and continues to have consequences for present producers.

[130] *Communicating in Three Dimensions: Questions of Audience and Reuse in 3D Excavation Documentation Practice*

After excavating the Praedia of Iulia Felix at Pompeii in 1755, architect Karl Weber published the building with an axonometric illustration that showed the remains in three-dimensional perspective. In doing so, Weber communicated additional information about the form of the building in a manner that was both accessible to a lay audience and sufficiently "scientific" for a scholarly one. By contrast, digital 3D documentation methods in current archaeological practice often reinforce a division between "scientific" models intended for internal consumption by the project that produces them, and public communication in the form of lower-quality online digital displays. Using recent fieldwork at the Greek colonial site of Histria in Romania as a case-study, this paper explores the space between high-quality 3D documentation used only by an internal audience and decontextualized 3D content designed for public consumption. In particular, we seek to determine whether high-quality, measurable 3D models derived from photogrammetrical capture are useful in communicating excavation results to other scholars—and if so, in what ways. We evaluate several scenarios for the role of high-quality 3D documentation in both formal and informal scholarly communication, and we discuss the potential for the reuse of such documentation to answer new research questions.

[121] *Women's Labor and Scholarship Production in Archaeology: Celebrating the Mentorship of Rita P. Wright*

Rita Wright's transformative work on gender and women's labor in West, Central, and South Asia provided an important framework for the archaeological study of craft production and the organization of labor. This interrogation of gendered practice was complemented by a parallel investigation of equity in academic archaeology, particularly through the work of the SAA's Committee on the Status of Women in Archaeology. In addition to her research and professional service, another significant contribution is Wright's mentorship and support of female students and junior scholars. Although this work is rarely rewarded or acknowledged, here we highlight examples of the guidance she has provided over the years as a way of recognizing and appreciating the tremendous impact she has had on the place of women in archaeology. We also discuss the influence of her work on recent projects in India.

Radding, Cynthia

[131] *Reading Cultural Landscapes in Time and Space: Ostimuri in Historical Archives and Archaeological Remains*

This paper discusses the historical construction of landscapes in the borderlands of northwestern Mexico, with a particular focus on the colonial Province of Ostimuri, bounded by the Yaqui, Mayo, and Fuerte rivers. In honor of Carroll Riley, the paper presents original research in historical archives, analyzed in the context of archaeological, ecological, and ethnographic literatures, to explain the formation of this space as a region and to explore both the vulnerabilities and the resilience of its peoples. Within this multi-disciplinary framework, the paper considers critically different methods of analysis and types of archival and non-textual evidence that contribute to the re-construction of historical processes of colonial encounter and cultural re-creation.

Rademaker, Kurt (Northern Illinois University)

[174] *An Interdisciplinary Approach to Investigate Early Andean Settlement Dynamics and Adaptation*

The Andean cordillera was one of the world's last mountain regions to be colonized by hunter-gatherers. To date, the empirical evidence indicates an initial appearance of humans in the high Andes (up to 4500 m above sea level) in the Terminal Pleistocene, about 12,500 years ago. Early forager sites

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

of the Andes exhibit a spectrum of settlement and mobility configurations, which constitute responses to the structure of resources in their specific habitats. Intriguingly, some of the earliest and highest sites indicate thorough familiarity with highland resources, implying either considerable pre-existing cultural knowledge about mountains or very rapid landscape learning. Current debates center on the identification of explorations vs more permanent settlements, functional configurations of early highland sites with those in lower ecological zones, and the role of physiologic and genetic adaptations in the settlement process. Approaches relying solely on assemblages of artifacts and subsistence remains may be inadequate to resolve these issues. Bioarchaeological study of early Andean skeletons, situated within a well-established context of site- and region-scale archaeological settlement data, can provide key information on diet, provenance, mobility patterns, inter-zonal social connections, and the appearance of novel morphologic and genetic features.

[164] *Virgin Anasazi Settlement Patterns in Valley of Fire, Clark County, Nevada*

Since 2003 the College of Southern Nevada (CSN) has conducted five field schools in Valley of Fire designed to teach students proper survey procedure and site recording techniques. Numerous sites (100+) from multiple time periods have been recorded through this work and, when combined with some earlier work from the area, have begun to yield results regarding our understanding of the settlement/subsistence patterns in the area. This paper looks at the settlement data from the Virgin Anasazi period (ca. 2000–850 B.P.), partially building on previous work in the region on the Virgin Anasazi by Margaret Lyneis. The data evaluated so far demonstrate that Valley of Fire is an archaeological region that holds the promise to enhance, or even change, many of our most cherished ideas about the prehistoric occupation of the southern Great Basin/northern Southwestern region.

Railey, Jim (SWCA—Albuquerque)

[325] *Lithic Assemblage Variability at the Regional Level: Raw Material Conditions, Time, and Site Function*

Several recent excavation projects by SWCA in far southeastern New Mexico have produced an immense dataset on lithic artifacts from 20 sites. This includes attribute data from thousands of individually analyzed lithic artifacts, mostly debitage. The excavated sites collectively cover a large swath across the region, and as such encompass appreciable variation in terms of local raw material conditions, as well as temporal affiliation and site function. Statistical analysis of the dataset was carried out to assess the relative effects of these variables in shaping assemblage patterning between these sites and local site clusters. The findings reveal that raw material conditions have a major influence on assemblage characteristics and variability. But temporal factors, including the changeover from the atlatl to the bow-and-arrow around A.D. 500, is also arguably an important factor behind the observed patterns. So too with site function, the influence of which is underscored by significant differences between selected certain sites. This includes a residential site where a variety of tasks were carried out, versus an adjacent site where activities were narrowly focused on lithic procurement, initial reduction, and perhaps practice knapping by beginners and novices.

Rainville, Charles (University of Oklahoma) and Asa Randall (University of Oklahoma)

[303] *Measuring Ancient Reuse of the Past: Archaic and Woodland Landscape Histories of the St. Johns River Valley, Florida*

The middle St. Johns River valley in northeast Florida was occupied more-or-less continuously beginning at least 9000 years ago. Regional inhabitation by hunter-gatherers involved extensive terraforming of the landscape, including the construction of earthen and shell mounds, in addition to many non-mounded places. Many locations were repeatedly occupied over the millennia, with successive generations modifying or otherwise interacting with existing, often ancient, places. Earlier research took these patterns as evidence for continuity in subsistence and settlement traditions. In this poster, we critically examine the trajectories of site reoccupation regionally in order to identify the context and conditions promoting site reuse through time. We compile site histories of mounded and non-mounded locations, drawing on nineteenth-century observations, twentieth-century salvage excavations, modern surveys, and aerial remote sensing including LIDAR and historic imagery. Our analysis identifies several pathways, including the maintenance of residential spaces and conversion to sacred space, that are tied to broader trends in environmental history, settlement, politics, and cosmology.

Ramsay, Jennifer (The College at Brockport, SUNY) and Noah Haber (The State University of New York Geneseo)

[12] *Examining the Concept of Hinterland in Antiquity in Arid Regions of the Levant Using Archaeobotanical Data and GIS Analysis*

Studies concerning the size of agricultural hinterlands in antiquity have generally been conducted on sites with favorable climates and have become the standard comparative tool. However, little has been examined relating to the size of a settlements hinterland in arid environments even when excellent archaeological evidence for extensive agricultural production, as can be seen in southern Jordan and Israel during the Roman and Byzantine periods. Likewise, a disproportionate focus has been placed upon urban settlements in archaeological research and as a result, the knowledge we possess of rural hinterlands and their contributions to the agrarian economy is largely unknown. Identifying the scale of agricultural productivity in arid environments between urban centers and their hinterlands can be examined using botanical remains overlaid with spatially variant environmental attributes that are deemed essential in the success of agrarian practices. The use of Geographic Information Systems (GIS) can make a complicated process of analyzing the nature and composition of botanicals according to environmental conditions readily possible. Preliminary results of this study

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

provide an example of how GIS can aid in analyzing the relationship between settlements and hinterlands in antiquity by comparing plant communities and the corresponding essential environmental parameters they were located within.

[35] *Woodland Subsistence in Upper East Tennessee*

This paper describes the species diversity and taphonomic modifications of Woodland Period fauna from Upper East Tennessee. Fauna from both rock shelter and open-air locales from the Early Woodland (ca. 3000 years B.P.) to the Late Woodland (ca. 1000 years B.P.) period are used to characterize subsistence practices and site use in the region. In this paper, we present the MNI, NISP and measures of diversity, richness, and evenness of different animal species identified in the faunal assemblages of more than a dozen Woodland Period sites. We also use taphonomic modifications, such as burning, gnawing, and digestion of bone, to discuss site formation processes. Finally, several dog burials are described.

Randall, Asa (University of Oklahoma)

[295] *The Impersistence of Persistent Places on the St. Johns River, Florida*

"Persistent places"—natural or terraformed locations that draw repeated human action—are unique resources for archaeologists investigating deep-time phenomena. Not only do they allow us to track social and ecological changes anchored in space, the repeated tending to such places set in motion historical path dependencies for descendent communities. However, at the human scale persistence is never a taken for granted, but is produced by the projects of communities who incorporate places into daily, commemorative, and cosmological frameworks. Because places are multi-temporal and relational, they persist in their being enmeshed in associations between persons, ecologies, places, and historical narratives; the linkages between which are subject to transformations as communities attend to present concerns and try to assure futures. The hard work of keeping places from becoming impersistent is immanent in the genealogies of terraformed landscapes of the middle St. Johns River in northeast Florida. There, over the course of nine millennia, hunter-gatherer communities manipulated old places and created new locations for daily living and cosmological reverence. Using depositional histories at shell mounds throughout the region, I track attempts by communities to maintain or recreate continuities in the face of landscape-scale threats from sea level change and attendant ecological transformations.

[260] *The Preceramic Occupation of Greater Chiriqui: An Assessment of Our Current Understanding*

The first substantial evidence of a preceramic occupation of Greater Chiriqui resulted from the 1970 excavations of upland rockshelters in the watershed of the Chiriqui River in Western Panama. Results from these excavations were reported in a 1972 dissertation and the 1980 publication *Adaptive Radiations in Prehistoric Panama*. Our current understanding of the preceramic period occupations in Greater Chiriqui owes more to subsequent innovations in research methods—phytolith and starch grain analyses and AMS dating foremost among them—and explorations of preceramic occupations beyond the boundaries of Greater Chiriqui than from any evidence from more recently discovered sites within the region. This presentation provides a reassessment of the preceramic evidence from Greater Chiriqui and an overview of what we should expect to find in the future.

Rangel, David (David Rangel), Juan Julio Morales Contreras and José Luis Punzo Díaz

[55] *Archeomagnetic Dating of Ceramic Potsherds of the Tingambato Archeological Site*

The archeological site of Tingambato, located in the municipality of the same name, is situated between the towns of Pátzcuaro and Uruapan, in the Mexican State of Michoacan. It is located at the south of the Tarascan plateau, at the boundary between the "tierra caliente" and the cold coniferous mountain land. In order to address the issue of occupational temporality of the site, we carried out absolute archeomagnetic dating of seven ceramic potsherds found at the site, taking advantage of the ability of magnetic minerals, contained within the ceramics, to record the direction and intensity of Earth's magnetic field at the time of its creation or last exposure to fire. This allows us to obtain the most probable age interval for these archaeological materials.

[227] *Levallois, Learning, and Lithic Variation: Results from Porcelain Flintknapping Experiments*

The ability to transmit cultural information with high-fidelity across generations is a defining trait of modern humans. It is unclear, however, how and when this adaptation emerged in the human lineage. The earliest forms of human technology—stone artifacts—required knappers to understand raw material mechanics, as well as geometry (volume reduction, angles), and physics. Thus, it is often assumed that the spread of lithic technologies involved some degree of information transmission. However, archaeologists lack systematic methods to study the transmission of information from lithic palimpsests. A growing interest in this topic has emphasized design theory (Carr 1995), breaking down lithic technology into a series of independent domains of lithic production (Tostevin 2012) (e.g. core orientation, platform preparation). The research presented here used controlled knapping experiments to understand the influence of varied social learning conditions on these technological domains. The ultimate goal is to define attributes that can be used as proxies for information transmission in Paleolithic assemblages. We simulated two social learning conditions: emulation (lower-fidelity) and imitation (higher-fidelity) as novice knappers were taught Levallois technology. Results suggest that attributes associated with core orientation are more strongly correlated with degree of information transfer than attributes of toolkit morphology.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Ranslow, Mandy (Connecticut Department of Transportation)

[203] *Quinebaug River Prehistoric Archaeological District and New England Hebrew Farmers of the Emanuel Society Synagogue and Creamery Archaeological Site*

The Connecticut Department of Transportation is the steward of two Connecticut State Archaeological Preserves. This paper will highlight the Preserves and give an overview of how an agency, generally in the business of building roads and bridges, has contributed to the preservation of two significant archaeological districts. The Quinebaug River Prehistoric Archaeological District in Canterbury was listed as a Preserve in 2003. The 22 acre preserve includes five National Register-eligible pre-contact Native American sites ranging from 500 to 4000 years old. These sites were identified and preserved as part of a wetland mitigation site. The New England Hebrew Farmers of the Emanuel Society Synagogue and Creamery Archaeological Site in Chesterfield (Montville) was listed as a Preserve in 2007. It is the remnants of the late-19th/early-20th century Russian Jewish farming community. CTDOT is working with the descendant community to find ways to maintain fragile remains of a creamery building while leaving avenues open for roadway safety improvements. CTDOT and NEHFES are currently collaborating to execute a preservation easement in hopes of obtaining grant funding for the maintenance of this notable Jewish settlement. Working with the State Historic Preservation Office, CTDOT continues to support the protection of Connecticut's rich archaeological heritage.

[103] *ZooaRchGUI: A User-Friendly Graphical User Interface with the R-Programming Language for Archaeologists*

Zooarchaeologists contribute valuable data to the exploration of archaeology's grand challenges. The scale and complexity of these problems requires zooarchaeologists to aggregate and analyze data using rigorous statistical methods while ensuring reproducibility and validity. Because assemblages can contain thousands of data points, conducting statistical analyses on all of the available data in a standardized fashion is difficult. ZooaRchGUI provides zooarchaeologists a free, user-friendly software that harnesses the power of the R programming language. It is currently available for download from the Comprehensive R Archive Network (CRAN). ZooaRchGUI provides a Graphical User Interface (GUI) that reduces direct interaction with R code, increasing accessibility while encouraging replicability and rigor. The program gives users the ability to import and modify data to suit their needs and easy-to-use functions to analyze data using statistical tools and visualize the results. The functionality of ZooaRchGUI is also continuously expanding; it is continuously updated to include innovative statistical tools providing a more stable, intuitive, and replicable user experience. Moreover, future versions of ZooaRchGUI will include broader techniques aimed at archaeologists across all sub-disciplines.

Rasic, Jeffrey (National Park Service)

[50] *A New Radiocarbon Dated Record of Holocene Weapon Technology from the Trail Creek Cave Site, Seward Peninsula, Alaska*

The Trail Creek Caves site on the Seward Peninsula in western Alaska was excavated by Helge Larsen in 1949–1950, and is among the most important archaeological sites in central Beringia. It contains a lengthy, rich and well-preserved paleoecological and archaeological record dating to the late Pleistocene, and the largest collections of mid-Holocene age organic tools from the region. However, poor chronological and stratigraphic controls have hampered the interpretive value of the site. New analyses of the collections at the Danish National Museum were recently conducted to refine the site's age controls, validate Larsen's artifact typology, and evaluate the stratigraphic integrity of the site. Direct radiocarbon dating of two dozen antler and bone tools provide new insights into the evolution of weapon technology and toolkit design, particularly for the Paleonuit (Denbigh Flint Complex) period.

Rasmussen, Amanda

[334] *Fort Halifax Park: A Shared Heritage*

Fort Halifax Park, located in Dauphin County, Pennsylvania, contains archaeological potential for both prehistoric and historic resources alike. The local community is proud of its heritage but lacks the resources and expertise to properly care and manage the property. Future development, which once seemed only a dream for the community, is now a possibility through a joint partnership involving The Friends of Fort Halifax, the Indiana University of Pennsylvania, the Pennsylvania Historic and Museum Commission, DCNR, and Dauphin County. As part of this effort, numerous archaeological surveys have taken place on the Park Property, including a thesis conducted in 2013. The results of the excavation, and the efforts of the community and the partners, produced invaluable results.

Rautman, Alison (Michigan State University)

[205] *Violent Conflict and a Ritual of Memory in the Puebloan Southwest*

Among Puebloan groups of the American Southwest, oral traditions record mythical-historical stories of the often-catastrophic or violent ends of some of the pueblo ruins that dot the landscape (e.g., Hopi Ruin Legends, by Michael Lomatuway'ma, et al., 1993). In other cases, archaeological evidence points to the continued importance of ruins across centuries of time as repositories of meaning across the landscape (Snead 2008). One small feature from a burned pueblo from Central New Mexico records a once-hidden act of memory amid evidence of extensive destruction. Here, at LA-9032, people long ago carefully buried two new corrugated ceramic jars within a maize storage room. Deformed pollen grains in the jar indicate that the masonry walls and charred corn kernels still retaining heat from the fire. This poignant act of remembrance, while hidden from casual passers-by, forms part of the complex story of that particular place, reaches across the centuries, bearing witness again today to long-ago suffering

Raviele, Maria

[133] *Mentoring a Versatile PhD: From Archaeology to an AltAc Career*

The training and mentoring received by Bill's students reflects his dedication to four-field anthropology, as well as a recognition that students may work outside academia. This paper reflects on lessons learned from Bill's seminars, his mentorship, and a four-field anthropological approach to graduate training in the evolution of one student's career from archaeologist to organizational anthropologist and evaluator.

[268] *The Afghanistan Cultural Heritage Education Program: A Collaborative, International Education Model*

The Afghanistan Cultural Heritage Education Program (ACHEP) is a collaborative project administered by the United States National Park Service and implemented by the Center for Middle Eastern Studies, University of Arizona and the Department of Anthropology and Archaeology, Kabul University. This international outreach effort engages Afghanistan's educators, students, and professionals in educational programs and activities to preserve and protect the country's rich cultural heritage and to enhance Afghanistan's capacity to protect heritage sites and better guard against looting and trafficking. In 2017 an introductory archaeology and anthropology course was co-delivered by instructors from the University of Arizona and Kabul

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

University. This poster explores the development of that course, how the team approached technological, physical, cultural, and security challenges and language barriers, and plans to expand the program to include an illicit trafficking of antiquities and art objects course. This course will take into account lessons learned during the first, introductory course. It will be available to members of the Kabul community as well as Kabul University students and faculty. The next course will also be supplemented with local outreach events. The model being developed through ACHEP can be used to develop other cultural heritage education programs.

Rawski, Zoe (The University of Texas at San Antonio)**[30]** *Monumental Displays: Ritual Performance and Preclassic Architecture at Early Xunantunich, Belize*

The site of Early Xunantunich in modern day Belize provides the opportunity for a uniquely detailed case study in Preclassic Maya architecture. Thanks to a lack of Classic Period overburden, the Mopan Valley Preclassic Project has been able to conduct extensive excavations of early architecture at the site, documenting important ritual activities from this early time period which likely played a key role in the development of sociopolitical complexity in the region.

This paper focuses on the monumental flat-topped platform that forms the northern boundary of the ceremonial center of Early Xunantunich. In addition to the presence of decorative marine shell ornaments and greenstone effigies which have been interpreted as kingly adornments, recent discoveries of additional buried offerings such as a smashed whole vessel and an uncarved stone monument suggest that this platform was the locus of important ritual activities by at least the Late Preclassic period. These activities share linkages to nearby sites in the valley, and are likely indicative of larger regional sociopolitical processes. Furthermore, our increasing understanding of the structure's form and construction history shows that this platform required a massive investment of labor and materials, modifying the natural landscape in a truly monumental way.

[30] *Chair***Ray, Erin (University of New Mexico) and Holley Moyes (University of California, Merced)****[134]** *Investigations of Plastered Constructions at Las Cuevas, Belize*

The ancient Maya site of Las Cuevas, in Western Belize features a cave system that runs beneath the main plaza. Investigations by the Las Cuevas Archaeological Reconnaissance project suggest that the site functioned as a Late Classic ritual pilgrimage venue and that the cave was used for large public centrally-organized performances. The cathedral-like cave entrance contains monumental architecture consisting of at least 76 plastered platforms. I hypothesize that the level of managerial oversight should be correlated with the consistency of building materials employed in their construction.

Plasters from both cave and surface contexts were analyzed using geochemical methods including XRF (pXRF), XRD, SEM, EDS and FTIR to examine their chemical make-up. Results demonstrate considerable variation in plaster recipes in the cave and on the surface. This paper will discuss these findings and their implications.

Ray, Erin [136] see Moyes, Holley

Raymond, Tiffany (Binghamton University), Carl P. Lipo (Binghamton University), Matthew Sanger, Timothy de Smet and Anna Patchen (Binghamton University)**[156]** *Magnetometer Surveys and the Complex Prehistoric Landscape of Poverty Point, Louisiana*

Poverty Point, Louisiana, is well-known for its massive architecture that includes earthen mounds and six semi-circular ridges. Geophysical surveys conducted over the past decade have revealed that the subsurface of this deposit also contains a large, extensive and diverse set of artificially constructed features. In addition, remote sensing demonstrates that features that have been often described as singular constructions are actually a palimpsest of overlapping depositional events. Here, we discuss the results of our recent magnetometer surveys conducted across Poverty Point in areas of the ridges and near the Mound B field. Our results support recent findings that the prehistoric Archaic landscape of Poverty Point included massive features such as woodhenges, pits, and other types of architectural structures that are not visible on the surface. In specific, we show that the site once included the largest woodhenge known in the Americas, a circle of wood posts that covered roughly 60 hectares. These results support the growing understanding of Poverty Point as the remains of activities that integrated prehistoric communities through repeated episodic group-level activity.

Ream, Randy (AUSA—WDKY)**[193]** *Discussant***Reamer, Justin (University of Pennsylvania- Department of Anthropology)****[85]** *Planting the Empty Spaces: Estimating Field Size from Storage Pits in the Upper Delaware Valley*

Landscapes are formed by diverse human actions and interactions with their surroundings through the performance of various tasks, or what Ingold referred to as the "taskscape." Recently archaeologists have turned their attentions to a previously neglected aspect of the landscape created through quotidian tasks, the agricultural field. These studies, however, tend to focus on preserved built structures still visible in the modern landscape. Direct study of agricultural fields in Eastern North America, however, has largely not been undertaken due to an absence of archaeological signatures marking the location of what were often ephemeral, extensive, and complex elements on the landscape. In the Upper Delaware River Valley, the historic Munsee and their ancestors lived on flood plain terraces where they practiced maize based agriculture. Although lacking direct evidence of fields, these people left behind large pits that based on paleoethnobotanical evidence contained maize and other agricultural crops. Using the excavated storage pits at the Shoemakers Ferry site, I estimate the total storage capacity for the site. This storage capacity will be combined with ethnohistorical data on planting practices for the Middle Atlantic and Northeast region to reconstruct the size and location of the agricultural field landscape associated with Shoemakers Ferry.

Reaux, Derek (University of Nevada, Reno) and Geoffrey Smith (University of Nevada, Reno)**[92]** *The Paleoindian Archaeology of Guano Valley, Oregon*

During the 2016 field season, the Great Basin Paleoindian Research Unit (GBPRU [University of Nevada, Reno]) began investigating Guano Valley, Oregon for evidence of Paleoindian occupations. Our initial work revealed a rich record of Terminal Pleistocene/Early Holocene (TP/EH) archaeology that appeared strongly associated with an extensive delta system that brought fresh water into Guano Lake from the south. This past field season, the GBPRU returned to Guano Valley and recorded numerous additional Paleoindian sites within the delta system. To date, we have recorded over 600

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

diagnostic TP/EH artifacts, predominantly of the Western Stemmed Tradition, making this one of the largest concentrations of Paleoindian material in the entire Great Basin. This poster presents new Guano Valley archaeological and environmental data, as well as an XRF analysis.

[116] *The Earthworks at Western of Amazon, Brazil: A Geoarchaeological Perspective*

In this paper, we will bring a geoarchaeological perspective in order to identify settlement patterns in two geometric earthworks (geoglyphs) located in the eastern region of the state of Acre in the Brazilian Amazon. Physical and chemical soil analysis suggests how the past inhabitants on those sites affected the soils. The results show that the settlement pattern and the most important differences from the other regions we have looked at, for instance, in the várzea (floodplain) area. In opposition of the larger villages along the White Water Rivers (at the Amazon or Madeira rivers), in the uplands the dispersed pattern surely existed to make best use of the soils. Therefore, we propose that the geometric earthworks are statements of power within the regional societies, made by people with similar cultural understanding. Soil analysis will also indicate how the people in the past were using the areas and the methods used to build the geometric earthworks. This will help us to have a better understand of the meaning of the geographic earthwork for those societies.

Reber, Eleanor (UNC Wilmington)

[9] *From General to Specific: Targeting Freshwater Resources in Pottery Residues Using Compound-Specific Isotope Analysis*

Direct detection of resources processed in pottery by means of the chemical analysis of absorbed pottery residues is a valuable technique, but identifying specific resources in pottery residues is tricky and problematic. This is due to issues with resource mixing from multiple uses of pottery, as well as the relative rarity of biomarkers unique to specific resources. Advances in compound-specific isotope analysis permit identification of isotopically distinct resources in residues, such as C4 plants in a C3 environment or marine resources. Can compound-specific isotope analysis be applied to the identification of freshwater resources in pottery residues? This study investigates modern freshwater resources and experimentally produced residues to address this question.

Redmond, Brian (Cleveland Museum of Natural History)

[52] *Examining Ritualism in Late Archaic Domestic Contexts: Clay-Floored Shrines at the Burrell Orchard Site, Ohio*

Much past research on the development of Archaic ideological complexity in eastern North America has focused primarily on ritualism and ceremony related to mortuary behaviors. Less attention has been given to ritualism within what is commonly thought of as domestic contexts and without overt mortuary ceremonialism or monumental architecture. The recent discovery of puddled clay architecture (floors) and associated features at the Burrell Orchard site (33LN15) in northeast Ohio provides new evidence for the development of significant, non-mortuary ritualism within Late Archaic basecamp contexts. That such activity took place alongside normal seasonal subsistence tasks is revealed by thick midden deposits containing abundant burned rock, nutshell and deer bone. The several bone and stone tool deposits associated with the floors, along with the labor-intensive nature of the clay construction for what appears to have been individually short-term usage, support the interpretation of these features as shrines possibly associated with hunting ritualism.

Reed, Karen (SWCA Environmental Consultants), Jonathan Libbon (SWCA Environmental Consultants), Aidan McCarty (SWCA Environmental Consultants), Benjamin Demchak (SWCA Environmental Consultants) and Erica Birkner (SWCA Environmental Consultants)

[303] *A Creek in Time: Landscape Archaeology of the Conotton Creek Drainage of Eastern Ohio*

Starting in 2015, archaeological survey for a large natural gas pipeline project investigated large portions of the Conotton Creek Drainage in Eastern Ohio. Prehistoric site clusters, identified during the project and previous investigations along Conotton Creek, provide an opportunity to investigate the prehistoric utilization of the landscape. Analysis of the dataset generated suggests there is patterning in the temporal and spatial distribution of prehistoric sites along Conotton Creek. Expanding the dataset to include other previously recorded sites in the Conotton Creek drainage as well as comparisons between the prehistoric use of the Conotton Creek drainage and larger river drainages, such as the Tuscarora River and the Vermillion River allows for a better understanding of the role of minor drainages in the prehistoric landscape. This poster seeks to highlight the research conducted for the project within the Conotton Creek Drainage regarding how prehistoric groups utilized minor drainages along the margins of the Appalachian Plateau.

[15] *Making the Most of Salmon Pueblo's Enormous Dataset: The SPARC Project*

The ruins of Salmon Pueblo were excavated by Cynthia Irwin-Williams, her staff, and students in the 1970s. A huge archive of material culture, photographs, excavation records, and analytical data was produced documenting Salmon's Chacoan and post-Chacoan occupations. With support from the National Endowment for the Humanities, the Salmon Pueblo Archaeological Research Collection (SPARC) Project was created with the goal of making the enormous Salmon dataset available to scholars through an online portal. This project (due to launch in Spring 2018) will allow users to access more than 15,000 scanned images (photographs, maps, drawings), roughly 35,000 pages of scanned original Salmon field forms, and a relational database structure integrating over 250,000 lines of data from dozens of Salmon databases. When completed, SPARC will provide researchers with unprecedented online access to one of the most important Chaco Canyon Outliers. This poster will discuss the process by which SPARC is being created and preview some of its features.

Reeder-Myers, Leslie (Temple University) and Kathryn Cross (Southern Methodist University)

[84] *Scallop, Clam, and Oyster: 4500 Years of Shellfish Harvest on the Rappahannock River, Virginia*

Today, the Rappahannock River is known for having some of the best oysters on the east coast of North America, and people have been taking advantage of that resource for thousands of years. A large, multi-component shell midden site at Belle Isle State Park provides a glimpse into shellfish harvesting for the past 4500 years, and suggests that the estuary's ecosystem changed significantly over that time period. During Woodland and Colonial phases of occupation, oyster makes up between 98 and 100% of shellfish remains at the site, but represents less than half of the shellfish consumed during the Late Archaic occupation. We explore some of the reasons behind this change, including possible shifts in human settlement patterns based on isotopic analysis of shellfish. We conclude that the faster pace of sea level rise during the middle Holocene promoted the development of a very different ecosystem than the one we see today, with important implications for resource management in the 21st and 22nd centuries.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Reents-Budet, Dorie (Smithsonian Institution), Ronald L. Bishop (Smithsonian Institution), Joseph Ball (San Diego State University) and Jennifer Taschek (San Diego State University)

[258] *Las Ruinas de Arenal and the Buenavista del Cayo Polity: Political Dynamics in the Western Belize River Valley*

The socio-political and economic interactions of Las Ruinas de Arenal, a small but architecturally rich center in the lower Mopan River Valley, are explored through a focused investigation of select Classic period (250–850 CE) pottery from general occupation and special deposits. The study combines ceramic typological data with evaluations of artistic style and paste chemical composition. Previous archaeological investigations by Taschek and Ball found scant evidence of foreign influence in Las Ruinas elite institutional behavior during the Middle and Late Classic periods in spite of the site being located only 5 kilometers south of Xunantunich, a major Late Classic center closely aligned with the powerful Naranjo polity to the west. This study scrutinizes the ceramic record from Las Ruinas to further assess the socio-political relations of Las Ruinas with local and “foreign” entities.

Reese, Kelsey (University of Notre Dame) and Brian Yaquinto (Bureau of Land Management)

[226] *Mind the Gap: The Mesa Verde North Escarpment*

Archaeologists are inherently limited in their understanding of the past by the quality and quantity of data available. In the US Southwest, we are fortunate to work in a region with a high degree of preservation and long history of archaeological inquiry. Because we work in a region with a dense and well-known archaeological record, we sometimes take what we know for granted and do not critically examine our assumptions. In the Mesa Verde region, extensive survey and excavation have revealed high population densities between AD 600 and 1300 both on and off the Mesa Verde cuesta. We have a knowledge gap, however, on the Mesa Verde North Escarpment. With limited habitation information, we assume the North Escarpment was less densely occupied than the immediately surrounding regions, but our assumptions are the product of missing data and not necessarily a reflection of settlement patterns and landscape use. This poster synthesizes what we currently know, what we do not, and employs a predictive model using the limited available data to help us better understand how the Mesa Verde North Escarpment may have been utilized from AD 600–1300.

Reese-Taylor, Kathryn, Atasta Flores Esquivel (Universidad Nacional Autonoma de Mexico), Nicholas Dunning (University of Cincinnati), Armando Anaya Hernandez (Universidad Autonoma de Campeche) and Debra Walker (University of Florida)

[252] *Monumentality and Horizontality in a Preclassic Cityscape*

During the Preclassic, the inhabitants of Yaxnohcah, Campeche, Mexico constructed more than 13 civic architectural complexes, each at least 20 m in height. These civic complexes were situated throughout roughly a 36 km² area in a carefully planned quadripartite arrangement. Alongside these imposing structures, the early Maya also built massive platforms for public gatherings, large centralized reservoirs, a radial network of inter- and intra-city roads, and extensive agricultural features. In this paper, we argue that the volume and arrangement of the civic architecture and the scale of the infrastructure reflected concepts of both monumentality and horizontality that created a uniquely Maya cityscape.

Reetz, Elizabeth (University of Iowa Office of the State Archaeologist)

[168] *Integrating Archaeology and Environmental Education to Strengthen a Place-Based Curriculum*

The practice of archaeology involves studying human adaptation to the natural world by using the environment as a vehicle for the development of knowledge. Archaeology education has strong parallels and intersections with the well-established field of Environmental Education (EE); yet, it is both widely acknowledged that cultural history is one of the weaker components of EE, and many archaeology educators are likewise unfamiliar with EE. In 2016, archaeologists from University of Iowa Office of the State Archaeologist partnered with staff from the University of Iowa School of the Wild, a week-long EE experience for area schools, to create a curricular unit that integrates archaeology and cultural history with EE. Pre- and post-test assessments during the pilot year yielded promising results for using EE as a tool to promote archaeological and environmental stewardship. Additionally, research on Significant Life Experiences in EE is explored in relation to the preservation of cultural resources.

[200] *Landscape Evolution, Digital Terrain Analysis, and the Integrity of Surface Assemblages: A Case Study from the Koobi Fora Formation*

Lithic surface scatters comprise a large proportion of the archaeological record but their value for understanding human behavior is often doubted. Modern geomorphological processes often laterally displace and selectively bias surface assemblages of artifacts. The predictable effects of displacement on the condition, weathering and size distributions of lithic assemblages is better understood. While topography is known to play a role in this process, the degree to which topographic variables contribute to the taphonomy of surface assemblages is understudied. Understanding how topography influences the displacement and taphonomy of surface assemblages provides a potential avenue for assessing the extent to which surface assemblages reflect past human discard patterns. We use digital terrain analysis to investigate the influence of topography on the formation of surface lithic assemblages. The modern geomorphology and topography of the lithic landscapes from the Koobi Fora Formation (Kenya) are characterized by digital elevation models obtained from unmanned aerial systems. Spatial analysis is used to assess the relationship between the modern landscape and taphonomic attributes of surface assemblages. A discussion of the efficacy of this approach for assessing the integrity of surface assemblages is presented. This research was supported by the National Science Foundation, OISE awards 1358178 and 1358200.

[138] *Resources, Goals, and Standards: The Basics of Digitizing Archaeological Collections and Legacy Materials*

Digitization, the conversion of an analog item and creation a digital surrogate, is an important collections management tool. Digitizing collection materials can provide engaging images for public outreach and education, improve knowledge of the collection and access. It also aids in the preservation of materials by creating digital surrogates of content. Digitizing material can rescue content from obsolete media, provide a way for researchers to view content while protecting fragile, physical items, and/or provide a digital version of the item that can be copied and preserved. Digitization can be daunting, though: it requires an investment in people, technology, and space; and an awareness of standards that can appear to be constantly changing. This practical presentation is designed for collections managers, curators, and conservators new to digitizing collections or who want to build on a nascent digitization program. It will also be helpful for archaeologists coping with legacy archaeology materials. The presentation will touch on how to evaluate current resources, short-term goals, and long-term goals. It will also cover the topic of archival standards for digitizing collections, where to find them, and how to select standards for your needs and goals.

[6] *Obsidian Procurement and Exchange in Peru: A Social Network Analysis (SNA)*

Wider accessibility to analytical instruments has resulted in the rapid expansion of geochemical datasets useful to trace archaeological materials such as obsidian to their geologic source. While these findings are useful on a site-to-site basis, this paper utilizes Social Network Analysis (SNA) as an exploratory tool to investigate broad-scale patterns of obsidian procurement and exchange in prehistoric Peru. Alongside visualizations of this large dataset, centrality measurements allow us to identify key nodes in likely exchange networks, instigating new questions on prehistoric economies and inter-regional connections. The resulting analysis provides a diachronic comparison of obsidian use in the Central Andes with consideration to varying geographic and political scales that include the domestication of camelids, the development of urban and temple centers, and the first state-level economies.

[336] *Meat or Grains: Compound Specific Carbon Isotope Analysis along the Northern Edge of the Tibetan Plateau*

Various foothills, oases and valleys along the north edge of the Tibetan Plateau played important roles in the process of food globalization in prehistory. These are the key corridors that brought southwest Asian animals along with the western grains into China and Chinese cereals to the West. Recent research demonstrates that broomcorn and foxtail millet (both C4 plants) were the key staple food in this region during the third and second millennium BC, but it remains unclear to what degree humans also relied on animal protein. Here we closely examine the dietary importance of grains and meat at several sites in western China from this period. We compare previous bulk collagen stable isotope results with compound specific carbon isotope analyses of individual amino acids extracted from human and animal bone collagen. Because essential and non-essential amino acids reflect different components of diet, compound specific carbon isotope analysis offers a means to isotopically distinguish between protein and non-protein dietary components, making it possible to determine to what degree humans were consuming meat directly versus consuming animals that were fed millet. Preliminary results for humans from Huoshaogou corroborate previous Bayesian mixing model estimates by suggesting that humans were consuming millet directly.

Reid, Sean

[210] *Satellite Remote Sensing and Archaeological Survey in Central and Western Regions, Ghana*

Humans have inhabited southern Ghanaian forest for millennia, and nearly everywhere there are traces of human activity in the deep past. This paper discusses my integration of satellite remote sensing with traditional archaeological field methods to study longue durée continuity and transformation in both West African societies and the landscape itself. I am consolidating previous survey data and expanding upon them using several methods of archaeological survey and remote sensing with the broader goal of tracing cultural patterns in the landscape using GIS. Specifically, my work has been testing the informed hypothesis that many sacred groves, hilltops, and low rises in the coastal hinterlands and forests of Ghana were the settlement sites of agricultural communities in the first and early second millennium A.D. To do this I used a combination of satellite imagery analysis, topographic information, and archaeological survey to predictively model and test where these sites will be located based on this hypothesis. I will also discuss some of the similarities, differences, successes, and limitations I have encountered while using remotely sensed satellite imagery for archaeological survey, in direct reference to my previous work identifying archaeological sites through vegetation patterns in Sierra Leone.

[308] *Slavery and Freedom from the West Indies to West Africa*

"Freedom is what you do with what's been done to you" is a phrase attributed to Jean-Paul Sartre. While the French philosopher was concerned with political freedom rather than freedom in the context of slavery, Sartre's words offer lessons for analyzing a vast spectrum of how individuals experienced the conditions of slavery and freedom. This paper explores an ambitious project of freedom and future-making initiated by a group of Barbadians one generation after emancipation in the English Caribbean. In 1865, the Cora landed in Liberia in order for free Afro-Barbadians to assist in the "civilizing" process already underway in the nation. We offer some preliminary thoughts on the material signatures of slavery and freedom observed in Crozierville, the small town established by the Barbadians. The Barbadian settlement in Liberia came to exhibit some of the attributes of the colonial society of their homeland that had been dominated by slavery just 30 years earlier. While the "Love of Liberty" brought Barbadians to Liberian shores, semblances of slavery are still visible on the social and physical landscape, highlighting the fragility of freedom in addition to the complexities of freedom-making for Africans and people of African descent on both sides of the Atlantic.

[299] *The Imbalanced Archaeology of Honduras: Challenges and Potentials*

This paper presents a brief overview over past and current trends in non-Maya archaeology of Honduras. From the beginnings of archaeological investigations in Honduras, there has been a strong research focus on the Maya city of Copan in the extreme west of the country. But already in early years, pioneers like William D. Strong, Doris Stone and Claude Baudéz made valuable contributions, in order to reveal the hidden history of central

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Honduras, the Atlantic and the Pacific coast. The lack of research in these regions of Honduras in the following years, due to the ongoing interest in the influence of the Maya culture in western Honduras, and also to the difficult sociopolitical situation, resulted in an imbalance of archaeological research which today prevents the understanding of cultural processes between Mesoamerica and Lower Central America.

In recent years, new archaeological projects were started which reveal the great potential of research in the hitherto less studied regions. A well trained new generation of archaeologist is using new methodologies and technologies to systematically study settlement patterns, regional chronologies and intercultural relations. This new research results in the definition of new strategies for archaeological research in Honduras in the future.

[217] *Rare Animals at a Mississippian Chiefly Compound: The Irene Mound Site (9CH1), Georgia, USA*

The Irene site (ca. AD 1150–1450) was a small, prestigious community occupied by a chief and his lineage. It was located on the Savannah River, a few kilometers inland from the Atlantic Ocean. The presence of animals rare in the region and animals rare or absent in other coastal assemblages distinguishes the Irene collection from other tidewater collections. Many of these animals exhibit atypical, even dangerous, behavior. Rare animals, and other attributes, provide a standard for assessing ritual activities, site functions, and the status of specific residents at this and other coastal sites.

Reitze, William (University of Arizona)

[182] *Of Truck Tires and Kelly Bars: Geoarchaeological Perspectives of a Toolpusher*

Over the course of several summers I had the opportunity to apprentice to Vance Holliday as he worked on the Southern High Plains. Whilst this work typically involved long hot days I had the opportunity to learn a lot of the intricacies of how field work is conducted by itinerant geoarchaeologists. This allowed me to be directly involved in research at some of the most prominent projects in Arizona, New Mexico and Texas. It also exposed me to a cross-section of small towns, motels, and BBQ restaurants few people will ever experience. I learned a great deal about the intricacies of hydraulics and witnessed first-hand the tensile strength limits of steel. I was even exposed to a fair amount of soils and sediment analysis. While these things at times formed a steep learning curve, I had the opportunity to apply them to my own work in the Estancia Basin of Central New Mexico. My dissertation research focused on developing an interpretation of Paleoindian behavior in conjunction with models of shifting environments at the Pleistocene/Holocene transition. This paper will present my research in the Estancia Basin, interspersed with my educational foundation in field geoarchaeology with Vance on the Southern Plains.

[239] *A Geospatial Analysis Exploring Movement and Perception in the Selection of Alpine Cairn Locations in Southeast Alaska*

In 2013 an intensive archaeological survey of a portion of northern Baranof Island in southeast Alaska, focusing on the slope and crest of Cross Peak Mountain, resulted in the discovery and documentation of fifty loose rock "cairns" estimated to have been constructed 500–1500ypb. These prehistoric alpine features, overlooking the intersection of Hoonah Sound and Peril Strait, are often associated with stories and narrative referencing the "Flood" by Tlingit people from both Sitka and Hoonah (Xutsnoowú) territories. Exploratory spatial analysis of the distribution of these alpine cairns is pursued with the goal of increasing our understanding of Tlingit activities in this alpine setting. Using Geographic Information Systems (GIS) tools and methodologies to examine the environmental characteristics of cairn locations, as well as assess accessibility and visibility, we explore the ancient decision-making that may underlie the placement of these rock features. Different approaches for assessing accessibility including site catchments, least-cost paths, networks, and corridors, as well as varying cost parameters are explored. Potential patterns in the visibility of the surrounding landscape from each cairn location are examined to explore the role of vision and perception in the activities in this setting.

[176] *Tracing Mobility in Pacific Coast and Highlands of Southern Mexico during the Classic Period*

This study presents the strontium isotopic analysis of enamel, dentine and bones of four individuals recovered from two sites (Miguel Aleman and PIN7), dating respectively from the Early and Late Classic period, both located the Pacific coast of Chiapas. The enamel samples of the four individuals have a Sr isotopic composition that varies between 0.70540 and 0.70631 for the 87Sr/86Sr ratio. The results were compared to data available for human bones and teeth, as well as rock, plant, water, and clay sources from Mexico and Guatemala. The enamel samples have a Sr isotopic signature that differs from that of the local rocks, plants, water and human remains. They have a Sr isotopic signature compatible with the metamorphic province developed in the valley of Motagua and the Copan area as well as farther northwest of the sites in the upper edge of the piedmont. They are also compatible with samples from sites in the Basin of Mexico and along the Gulf Coast in the northern part of the Veracruz Province. The different hypotheses on the origin of the four individuals are discussed in the context of regional interactions and demographic changes in southern Mexico during the Early and Late Classic period.

[334] *Community Archaeology Starting Young: Local High School Engagement in Tucson, Arizona*

The past few years archaeology has seen an increase in community-based approaches. These approaches are important when addressing issues of who archaeology knowledge, interpretation, and sites belong to. Archaeological interpretations historically come from those in roles of academic authority, but we increasingly see acknowledgement of collaboration and contribution from community members not in those roles. A rise in diversity of cultural and heritage backgrounds among archaeologists is a factor in decentering approaches as they have been traditionally practiced. Encouraging this diversity should begin with archaeology education and exposure before college years. Linking Southwest Heritage through Archaeology is a program that aims to expose high schools students, who are from historically underserved and underrepresented groups in archaeology, to sites and opportunities that may spark interest in their continuing education and activism in archaeology. With a partnership between the National Park Service, University of Arizona, and nonprofit Environmental Education Exchange we have been providing opportunities for students to learn about archaeology while they contribute ideas that are shaped by their cultural and heritage backgrounds. By providing these opportunities we learn approaches to increase diversity in our field while providing a conduit for students to continue involvement in archaeology.

[182] *Beringian Landscapes and Human Responses in the Middle Tanana Valley, Alaska*

The middle Tanana Valley of interior Alaska, an unglaciated region of Eastern Beringia, holds a high-resolution record of human-environment interaction that extends over 14,000 years. The Late Glacial and early Holocene landscapes of this region were dynamic with considerable ecological restructuring. Aeolian deposits accumulated in lowland areas and adjacent foothills at relatively high rates, soils were relatively underdeveloped, river down-cutting prevailed across the valley, and wild fires were common. These disturbance regimes and periods of landscape instability fostered a wide expanse of early- to mid-successional mixed vegetation communities that included herbaceous tundra, shrubs and deciduous trees, key habitats for large grazers and browsers that were significant resources for early hunter-gatherer populations.

Major environmental transitions occurred in the region as the Holocene climate warmed and effective moisture increased, including the spread of boreal forests and peat lands, an expansion of lake development, and intensified landscape stability. These transitions introduced changes to the extent of habitat and seasonal availability of mammal and aquatic food resources. We discuss broad human responses to these environmental shifts in this region from the late Pleistocene through the later Holocene.

[184] *Chronology of the Human Occupation of the North-western Channels of Patagonia (43°-46° S), Chile*

We present results of a systematic radiocarbon dating program carried out in the Chonos archipelago, the northernmost part of the channels of western Patagonia. Eighty-six samples obtained from a variety of archaeological sites, including: strata beneath organic soils, open-air shell middens, caves and rock shelters, individual burials and ossuaries, and modern industrial extraction shell middens, were analyzed. The chronological and spatial distribution of dates along with the analyzed contexts, allows us understanding occupation of this archipelagic territory by marine hunter-gatherer-fishers at different scales. We evaluated the intensity of the archaeological signature starting with the first evidence of occupation at the Middle Holocene (6300 cal BP), to the European contact (16th century) and post contact. We recorded continuities and discontinuities in the use of space, discernible in time and throughout the archipelagic geography. These are used to discuss the human trajectories. Rhode, David (Desert Research Institute)

[174] *Tibet before Pastoralism*

The Tibetan pastoral economic system that has evolved over the last several millennia involves permanent high altitude herd management combined with mutualistic relationships with lower-elevation agricultural communities. How this traditional pastoralist system developed in the middle to late Holocene from a prior foraging lifeway remains something of a puzzle, requiring the domestication of the native high-altitude adapted yak, the establishment of sustained relationships between Tibetan foraging societies with lower elevation agricultural communities, and the possibility of conflicts between foraging and pastoralist economic strategies. Based on archaeological evidence from the northeast Tibetan Plateau, this paper hypothesizes some aspects of the economic and social transition from a pre-pastoralist Tibetan subsistence foraging lifeway to Tibetan pastoralism during the middle to late Holocene.

Richard, Francois (University of Chicago)

[181] *Imperial Mixtures and Paradoxes of Government in Colonial Senegal*

This paper examines the travails of colonial government in Senegal, looking specifically at material histories in the rural region of Siin. One tenet of French colonial policy was to govern through the operation of commerce, specifically through the infrastructure of cash-cropping. If peanut agriculture would, in principle, create both wealth for the colony and 'African subjects,' on the ground, peanuts combined with a web of material entities that bent, diverted, or interrupted the flow of imperial power: traditions of community-making; collective attachments to land, self-sufficiency, and ancestral influence; and cultural economies of objects, all of which had long shapeshifted to the beat of broader historical forces. These mixtures of imperial and vernacular materialities—and the fields of agency they set in motion—find expression in the artifact assemblages of village vestiges occupied between 1800 and 1960. Tracing shifts in consumption practices during that period, I reflect on the fraught, ambiguous process of colonial rule, whose effects were chronically interrupted, twisted, or evaded by Siin villagers; at the same time, colonial commerce also gradually wove peasants into a web of dependencies—on markets and the state, primarily—whose strains are still felt in rural Senegal today.

[215] *Unseen Aztalan: Preliminary Results of a Geomagnetic Survey of the Aztalan Enclosure*

Lynne Goldstein's compilation of a GIS-based map of the Aztalan site, portraying all investigations through 1996, visually integrated almost two centuries of archaeological work at the site in southern Wisconsin. Lynne's map made two things startlingly clear. First, decades of excavations were not all referenced to a common datum and few had left visible surface indications, making it difficult to relocate earlier excavations and avoid re-excavating disturbed contexts. Second, just 10% of the core residential area has been excavated and far less than 10% of the entire site has been

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

studied. To gain large-scale spatial control over ancient and modern subsurface disturbances across the site, the authors undertook a comprehensive magnetic gradient survey of the entire palisaded portion of the site. Data were collected using a Foerster Ferex 4.032 4-probe fluxgate gradiometer array mounted on a handcart. Data collection and processing was conducted by Ohio Valley Archaeology, Inc. Results of the survey are leading to a more comprehensive understanding of site organization and refined knowledge of the locations of excavations and other modern ground disturbance activities. Future fieldwork will focus on ground-truthing geophysical anomalies and updating archaeological knowledge of the site for all stakeholders.

[316] Moderator

Richards, Katie (Washington State University)[267] *A Low Technology Approach to Understanding Fremont Ceramic Production*

Unlike other regions of the American Southwest, many basic aspects of Fremont ceramic production have never been adequately explored, and many of the assumptions about the production process presented in the literature have never been rigorously tested. Low-technology analysis techniques such as re-firing can provide a simple and cost-effective way to begin exploring these processes and test assumptions made by past archaeologists. Re-firing Fremont ceramics has provided new information about the choices made during the production process of the two main types of Fremont painted wares, Snake Valley Black-on-gray and Ivie Creek Black-on-white, some of which contradict previous assumptions. This information includes clay sources, slip choices, and paint pigment composition. These data concerning the production process provide insights into the technological style of Fremont ceramics as well as the communities of practice that produced them.

[107] *Law and Ethics: The Milwaukee County Poor Farm Cemetery Excavations in the Context of the Wisconsin Burial Site Preservation Statute*
The 1987 Wisconsin Burial Site Preservation Statute (WisStats 157.70) serves as the basis for the protection of all burial sites in the State of Wisconsin and assures that all human burial sites be accorded equal treatment under the law regardless of age or affiliation. A burial site, under the law, refers to any place where human remains are buried and includes marked and unmarked cemeteries, Native American mounds, small family cemeteries, and other less obvious locations that are reported to the Wisconsin Historical Society. No burials, regardless of age, ancestry, cultural affiliation or condition may be intentionally disturbed without first obtaining a permit from the director of the Wisconsin Historical Society. This law also determines the final disposition of all materials related to the granting of an excavation permit. Excavation at the Milwaukee County Poor Farm Cemetery 2 in 1991 and 1992 and again in 2013 have provided a unique test of the application of the Wisconsin law. This paper examines the legal and ethical issues related to excavation, analysis and final disposition of all human remains, personal artifacts, burial hardware, field notes and field images associated with the excavations at the Milwaukee County Poor Farm Cemetery 2.

Richter, Kim (Getty Research Institute) and María Eugenia Maldonado Vite (INAH Veracruz)[128] *Domestic vs. Elite Religious Cults: Revisiting the Huastec Tlazolteotl-Ixcuina Deity Complex*

Pre-Columbian Huastec stone sculptures and clay figurines for the most part have been interpreted as deities and assumed to belong to the same religious cult. They also have typically been interpreted through a central Mexican lens and been identified as and associated with Late Postclassic central Mexican deities. Female figures in particular have been interpreted as Tlazolteotl, the central Mexican goddess of parturition, sexuality, and purification—a deity thought to be closely related to the Teenek (Huastec-Maya) goddess Ixcuinan, the lady of cotton. This presentation will reassess this interpretation, taking into account new archaeological data alongside well-known pictorial and textual sources. It also address interpretations of this Tlazolteotl cult from a broader Gulf Coast perspective and consider the Classic-to-Postclassic connections. We propose that although Huastec figurines and sculptures share stylistic features, they indicate different levels of cult. While the female sculptures appear to represent Huastec high-status women, female figurines seem to reflect local domestic cults tied to the cultivation of cotton.

This paper will focus on the development of marine archaeology in Indonesia and Southeast Asia. It will also highlight the interdisciplinary and integrated marine archaeology research programs in the region having aims to investigating shipwrecks, cargoes, and maritime heritage recent condition as well as identifying human and environmental threats. Marine archaeology research, sustainable shipwreck utilization for tourism development, and local people engagement in underwater cultural heritage (UCH) preservation have helped an appropriate shipwreck management as appeared in United State Army Transport (USAT) Liberty shipwreck site in Bali. This paper will also share information on the current state of UCH

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

preservation and legal protection issues, for example, some problems faced by the historic World War II shipwrecks, United State Ship (USS) Houston and Her Majesty Australian Ship (HMAS) Perth; the good prospect of long term on-site shipwreck monitoring involving local communities and general public; public education and awareness programs; as well as capacity building activities in local, national, regional, and international levels. It is expected that this paper will give a better understanding that marine archaeology in Indonesia has contributed in improving communities welfare and providing scientific-based recommendations for local and central government on site protection and management plan.

Riebe, Danielle (The Field Museum of Natural History) and János Dani (Déri Museum)**[245]** *A Dynamic Past: The Prehistoric Interactions on the Plain Project*

The collaborative, American-Hungarian Prehistoric Interactions on the Plain Project explores the past through the reconstruction of interactions. Investigations on interactions as an active mode of social investment and social construction challenges normative concepts of “culture” by modeling socio-cultural boundaries as a dynamic and negotiated process, as opposed to a static categorically assigned social unit. Moreover, our research contextualizes regional developments as the result of multi-scalar social processes. Initially, PIPP focused on the regional scale and reconstructed Late Neolithic (5,000—4,500 BC) long- and short-distance interactions between Herpály and Tisza sites through the stylistic, technological, and compositional analyses of lithics and ceramics. The results suggested a strongly enforced socio-cultural boundary between Tisza and Herpály sites in the Körös region. However, by focusing on the regional scale, the local dynamic interactions have been completely obscured. The current phase of PIPP focuses on the local scale at the Herpály site of Csökmő-Káposztás Domb to investigate how variation in household access to long- and short-distance interaction networks resulted in the previously modeled strongly enforced socio-cultural boundaries.

Riegert, Annie (Texas State University) and Lucy Gill (University of California, Berkeley)**[243]** *Mortuary Landscapes and Placemaking through Veneration at the Maya Site of Colha*

Traces of veneration are sedimented within the landscape and the collective memory of its occupants, transforming these spaces into places. Such palimpsests become potent, which, in the case of mortuary landscapes, can manifest in increasingly complex burial rituals through time. The 2017 excavations at Colha revealed a series of 9 interments in the main plaza of the 2000 sector, yielding a minimum number of 13 individuals. This mortuary area initially utilized during the Middle Preclassic was reused during the Late Preclassic, with some later interments cutting into those of the preceding period, as suggested by associated practices and material accoutrements. Zooarchaeological evidence indicates that although certain taxa, including deer, were exploited throughout the entire temporal span, others, specifically ichthyofauna, are characteristic of Late Classic mortuary contexts. The placement of elements from this taxonomic group within vessel burials alongside commingled human individuals is associated with the elaboration of mortuary practices more broadly, which includes complex secondary depositions and increasingly specialized craft production of grave goods. We argue that this change, which corresponds to an expansion of stone tool workshops and population increase at Colha, can be considered an act of veneration specific to this space—an act of placemaking.

Rieke-Zapp, Dirk (AICON 3D Systems) and Elisabeth Trinkl (Karl-Franzens-University of Graz, Institute for Ar)**[118]** *3D Comparison of Attic Head Vases*

Several hundred attic head vases are known worldwide and stored in museums and collections. In 1929, Beazley has categorized twenty groups based on stylistic properties and historic methodology. Head vases are assembled in several steps, most important for our comparison is the moulding of the head area. Since moulds were used to shape the heads, our initial hypothesis was to perform a quantitative comparison of head shapes based on digital scan data. Comparison of scan data is straight forward and is very similar to quality control and inspection processes in industrial applications. Initial analysis was performed on older scan data. In addition, a high-resolution fringe projection scanner was employed to scan further head vases in museums in Germany and Italy. Scan resolution and accuracy of approximately 0.1 mm in all dimensions were required to reveal differences below 1 mm. Shape analysis results of the head areas confirm that it is likely that the same mould was used for shaping some of the head vases. According to our results, it is also not unlikely that a first generation of larger head vases was used to prepare moulds for consecutive generations of head vases that are slightly smaller in size.

[118] *Chair***Riel-Salvatore, Julien (Université de Montréal)****[329]** *Acculturation and Its Discontents: Rethinking Models of Interpopulation Interaction during the Middle-Upper Paleolithic Transition*

Given how large the topic of acculturation looms in discussions of the Middle-Upper Paleolithic transition, it is surprising how little attention has been paid to defining it in order to develop operational concepts that can be tested against the archaeological record. In the specific context of the Middle-Upper Paleolithic transition, the notion of acculturation has usually been considered as a unidirectional, one-size-fits-all social mechanism to explain both the appearance of transitional industries and the disappearance of Neanderthals. However, considering the growing genetic evidence of sustained interbreeding between distinct hominin populations during the Pleistocene, it is likely that interpopulation interactions were more fluid and dynamic than often assumed under the acculturation scenario. To account for this, we present here a review of the notion of acculturation and the likely archaeological manifestations of its different forms. We then compare this against the archaeological record of Western Europe in order to demonstrate how a more nuanced and ethnographically-grounded approach to the notion of acculturation is needed in order to properly model and ultimately make sense of the full variety of human experiences in that critical moment of our evolutionary past.

Riel-Salvatore, Julien [219] see Pothier Bouchard, Genevieve

Riggs, Chuck (Fort Lewis College)**[110]** *Indigenizing Archaeology in the 21st Century*

Nearly 30 years after the passage of NAGPRA, indigenous perspectives and consultation have led to significant positive changes within the practice of archaeology in the United States. Despite these advances, however, it seems that many archaeologists continue to adhere to the letter of the law while disregarding its spirit, suggesting that the colonial imperatives that gave rise to our discipline remain firmly entrenched. The Eurocentric interpretive frameworks, use of loaded terminology, and paternalistic application of science in determining cultural affiliation show that as a discipline, we still have much learn from those whose pasts we attempt to understand. We ought to critically and reflexively evaluate our discipline's very purpose. Instead of self-serving, academic ladder climbing and insensitive explication of scientific “truths,” the practice of archaeology has the power to strengthen indigenous rights to place and to critical resources. As Western scholars, we need to listen more and pontificate less if we truly wish to serve the needs of descendant communities. This is, after all, what NAGPRA and other federal laws ask of us. Regardless of law, however, our professional ethics should compel us to do better.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Riley, Tim (Prehistoric Museum @ USU Eastern)**[126]** *Fremont Paleocuisine: Reconstructing Recipes from Rectal Remnants*

The role of maize agriculture among the Fremont has been debated for decades. Archaeologists have organized dietary evidence from these widely dispersed communities, including faunal and floral debris, dental calculus studies, and experimental farming and foraging, to examine farming in the high desert. The Fremont farming/foraging frontier provides a framework to explore agriculture along the margins and the importance of diversified subsistence strategies across a network of rural communities.

Aside from the broad patterns of diet derived from skeletal stable isotope data, direct dietary evidence from Fremont communities remains scarce. Researchers have studied only a small number of Fremont coprolites from widely scattered sites. The coprolite record of neighboring Ancestral Puebloan communities is well-documented and contains specimens from maize-dependent nucleated pueblos and earlier dispersed farming villages. This coprolite data, along with specimens deposited by Archaic foragers across the Great Basin and northern Colorado Plateau, situates the Fremont data along a regional spectrum from foraging to agriculture. Framing each coprolite as a menu of consecutive meals yields insight into nuanced aspects of diet, including preparation and cooking techniques as well as deconstructed recipes. Ingredient lists derived from each specimen allow glimpses into the flavor combinations and basic techniques of Fremont paleocuisine.

[290] *Discussant***Rimer, Esther****[15]** *Sampling Archaeology at the National Museum of Natural History*

The Anthropology department at the Smithsonian Institution's National Museum of Natural History holds over 2.2 million ethnological and archaeological artifacts from the USA and all over the world in its collections, including archaeofauna and bioarchaeological specimens. Every year a handful of researchers sample from our collections for destructive and non-destructive sampling analysis. These analyses run the gamut from portable XRF on textile dyes, isotope analysis of oyster shells from middens, and ancient DNA from humans and prehistoric plants. The sampling requests have changed over the years as techniques have evolved- for example, we increasingly have requests to sample ancient DNA. Our curators must balance sampling requests with the need to conserve museum collections for posterity. If you're interested in learning what we have to sample and how to go about getting access, stop by this poster. You will learn what kinds of sampling have been done in the past, and how to increase the likelihood of your future sampling proposal being approved!

Rimer, Esther [139] see Martinez, Maria

Rincon Mautner, Carlos**[136]** *Cave Character, Ritual Performance, and Social Participation in the Mixteca-Puebla Region of Mexico.*

The Southern Mexican Highlands of Southern Puebla and Oaxaca present some of the most varied karstic landforms of Mesoamerica including rock shelters and well-developed sinkholes (dolines) and caverns. Its inhabitants known as the "people of the rain", shared cultural traditions that acknowledged the vital relationships between clouds, mountains, caves that lead to their interiors, and reliable, perennial springs found at the base of mountain ranges. Climatic variability in terms of the timely arrival of the rainy season, rainfall frequency and its duration made prognostication critical, as were the rituals that evolved in which the desire for a bountiful food supply could be expressed. Some caves seem to have served as places where ceremonies focused the social group's intentions aimed at obtaining the favor of the earth and rain deities. This paper analyzes the material evidence for ritual performance drawing from a small sample of caves and rockshelters, in which their unique and wide-ranging character is highlighted.

Ringberg, Jennifer (California State University—Stanislaus)**[165]** *Living Large at Cerro León: A Comparative Look at Living Spaces in the Early Intermediate Period Moche Valley*

The hill slope settlement of Cerro León (AD 1–400) contains all the typical elements of Early Intermediate period residential sites; spaces for cooking, crafting, sleeping and storage. The flow of most daily activity likely occurred between enclosed, roofed kitchens with heavily used hearths and enclosed but sunlit patios for food processing, spinning, weaving, and tool-making. However, some residences at Cerro León stood apart, not only because of their spaciousness and greater number of rooms but also their large dedicated ancestor worship areas and supra-household gathering spaces. Are these houses truly atypical? How do Cerro León's largest residential compounds compare to other residences at the site or to earlier and later patterns of residence in the Moche valley? Are differences apparent among contemporary dwellings elsewhere in the Moche valley—especially on the coast or in the sierra—where topography was less of a factor in construction? I address these questions and related themes in this paper.

Ringle, William (Davidson College), Tomás Gallareta Negrón (Centro Yucatan-INAH), Ken Seligson (USC) and David Vleck (Independent)**[18]** *Hidden in the Hills No Longer: LiDAR Coverage in the Puuc Region of Yucatan, Mexico*

LiDAR imagery is revolutionizing interpretations of ancient Maya demography, land use, and community organization, among other concerns. This paper provides preliminary observations on LiDAR coverage of 200 km² of the Puuc region of northern Yucatan, Mexico, collected in 2017 by NCALM. The Bolonchen Regional Archaeological Project has been working in this area since 2000, and although we have intensively studied settlement at both the urban and intersite level, LiDAR provides the opportunity to assess spatial organization on a far broader canvas. Until now, no Puuc center of any size has been fully surveyed, but these data provide coverage of at least seven centers in their totality. With substantial samples of two broad ecological zones, the LiDAR dataset also provides the basis for testing ideas concerning land management. They demonstrate, for instance, the absence of terrain modifications such as terracing on any significant scale. The distribution of settlement revealed in the imagery also point out the limitations of traditional categories of site analysis.

Ringle, William [162] see Galvan, Melissa

Riordan, Kyle (The Ohio State University), Julie Field (The Ohio State University) and John Dudgeon (Idaho State University)**[8]** *Scanning Electron Microscopy and Geoarchaeology of Naihehe Cave, Fiji*

This poster reports on field-work and laboratory investigations conducted on geoarchaeological samples from Naihehe Cave, located in the Sigatoka river valley of Viti Levu, Fiji. This research employs novel and exploratory methods, including Scanning Electron Microscopy (SEM), Fourier Transform Infrared spectroscopy (FTIR), and Inductively Coupled Plasma Mass spectrometry (ICP-MS) to determine the elemental content of sediment samples and for detailed imagery useful in grain size and shape analysis. These analyses have revealed that the sediments consist of several classes ranging from calcium hydroxide crystals, ilmenite, magnesium aluminum silicates, and calcium silicates that represent naturally occurring parent materials found in the Sigatoka River Valley. Other analyses include petrographic microscopy (XPL), phosphate burnoff, organic matter burn-off, carbonate burn-off, and radiocarbon dating. Geoarchaeological analyses such as these are critical to understanding the natural and cultural history of Naihehe Cave, as the site is associated with the first agriculturalists in Fiji, and may reveal new information pertaining to the settlement of the archipelago during the Lapita and Post-Lapita period. Using these methods adds to the conversation on how traces of human activity can be discerned at the smallest of scales, and how sedimentological "ecofacts" can aid in understanding archaeological deposits.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Rios Allier, Jorge (Indiana University) and Ma. del Pilar Casado Lopez**[42]** *Public Policies and Rock Art in México*

This paper aims to present an overview of the public policies applied to rock art in Mexico in the last years. This cultural resource is perhaps little known in its entirety, yet presents an invaluable variety for its study. Its registration, conservation, and study have allowed in recent years to know more about the vast heritage which the country has it. One of the goals is also to comment on the public steps that have been implemented in this area in different regions.

Ripley, Kevin, Laura Dzvonick (Los Angeles Pierce College), Tina Nupuf (Los Angeles Pierce College), Noble Eisenlauer (Los Angeles Pierce College) and Ronald Faulseit (Los Angeles Pierce College)**[155]** *Convergence of Tears at Momonga: Spiritual, Social and Personal Interactions of the Multiethnic Mourning Ceremony*

The village of Momonga (Ca-LAN-357) is located in the San Fernando Valley of Southern California, along the pre-Columbian boundaries of multiple ethnic groups. Rock art in the area indicates ritual activities involving people from various cultural traditions, including ancestral Chumash, Tongva, Yokuts, and Tataviam peoples. Excavations in a portion of the site have produced exchange and utilitarian items, such as shell beads, stone beads, amulets, stone bowls, hammer stones, pressure flakes, mortars, and pestles. Yet, there is little evidence for residential occupation. Instead, a significant number of buried offerings and human burials with intentionally broken utilitarian items placed over the bones, lead us to consider this area the locus of ritual activity. In particular, we suggest that the contents of these offerings as well as their placement in close proximity with important terrain features show similarities with modern day Mourning Ceremonies, involving dance, music, spiritual acknowledgment and worship, communication with the dead, physical manifestation of tears, wailing, and body convulsions. In this poster, we present the physical evidence that supports this interpretation and further postulate that the site may have served as a center of convergence between neighboring ethnic groups.

Rissolo, Dominique (University of California, San Diego)**[258]** *The Rise of Northern Maya Ceramic Chronologies: Emerging Perspectives on Middle to Late Preclassic Processual Dynamics and the Legacy of Joseph W. Ball*

Seminal and persistently relevant work by Ball has shaped and reshaped our understanding of Middle to Late Preclassic population movements on the Yucatan Peninsula and the establishment of local potting communities and traditions. Evidence of Middle Preclassic ceramic production in the northeastern-most Maya Lowlands had remained elusive until the mid-1990s. Early Nabanche affinities observed in the locally produced pottery of northern Quintana Roo suggested an expansion of peoples across the northern plains by the mid 7th century BC. Initial movements of populations from the eastern Petén and northern Belize were assumed to be coeval with the appearance of Chicanel Horizon assemblages in the northeast of the Peninsula. However, ongoing research in northernmost Quintana Roo suggests an introduction of the southeastern lowland Mamom tradition at a time earlier than Yucatecan influences from the west. Interestingly, recent excavations in Yucatan have revealed pre-Mamom pottery that may similarly reflect a "heterogenic homogeneity" described by Ball, whereby these earliest of types represent emerging yet distinctive regional traditions with deep ties to the south. Proyecto Costa Escondida (PCE) and Proyecto de Interacción Política del Centro de Yucatán (PIPICY) address these issues as well as Ball's contributions to northern lowland ceramic studies more broadly.

Ritchison, Brandon (University of Georgia)**[5]** *Immigration and Transformation: Local Community Response to the Abandonment of a Neighboring Region*

Following the abandonment of the Middle Savannah River Valley at the end of the 14th century, communities on the neighboring Georgia Coast adopted a new settlement system. At the scale of the region, this appears as a dispersal of settlement and an increase in size of the largest population centers that had previously existed. This paper presents the results of the first systematic intra-community survey of a large site on the Georgia Coast. Results show how residents of the site spatially reorganized their community following the arrival of Savannah River immigrants and how this reflects changed socio-political organization.

[5] *Chair***Rivas, Alexander (Washington University in St. Louis) and Brent Woodfill (Georgia State University)****[292]** *Teaching Climate Change in Red States*

Although scientific consensus was reached on the issue of human-made climate change earlier this century, it continues to be a controversial subject in the public sphere. Archaeologists, as scientists interested in a *longue durée* approach to human society and the environment, have thus been thrust into another ideological battlefield as hard-fought as the theory of evolution by natural selection, but with perhaps graver consequences. As we move fully into the Capitalocene, it is of the utmost importance to educate future professionals and politicians about the nature of climate change, its impacts on almost every aspect of our lives and livelihoods, and possible solutions. However, most archaeologists are working within the academy, already seen as a bastion of liberalism, political correctness, and "un-American" viewpoints by many of the people who have already been turned off to the message. The authors of this paper are working in institutions of higher education in Missouri and Georgia, two typical "red states" that are dominated by people who typically do not listen to the climate change message, and they discuss the best strategies and curricula to open students' minds to a scientifically grounded perspective.

Rivera, Antonieta**[28]** *The Architectural and Urban Design Principles of Tenochtitlan*

There exists a vast literature examining every aspect of Aztec culture. Despite this, few studies focus specifically on Aztec architecture and its implications for understanding broader aspects of Aztec cosmology. This paper contributes to our knowledge of Aztec society through an exploration of architectural and urban design principles that guided the building of their cities and ceremonial precincts. By examining ethnohistoric and archaeological sources, and drawing on evidence from several disciplines—art, astronomy, geography, geometry, mathematics and religion—I present a body of information relevant to the study of Aztec architecture and urban planning in order to analyse it from an archaeoastronomical perspective. I present a methodology that allows accurate analyses of the astronomical and topographic orientations of settlements and ceremonial architecture. This methodology integrates a wide range of digital applications including Google Earth, Google Maps, solar charting, topographic analysis, open-content collaborative, geo-location-oriented photo sharing applications as well as a custom-built geometric application. The results allow for a new understanding of: (1) the design principles of the Huey Teocalli, (2) the layout and design principles utilized in the construction of Tenochtitlan and Tlatelolco and, (3) the Aztec remodelling of Tenayuca, Santa Cecilia Acatitlan and Teopanzolco.

[333] *The 1973 Seminar on the Lacustrine Kingdoms in the Titicaca Basin*

Co-organized by John V. Murra and Luis G. Lumbreras, this seminar was planned as an international and interdisciplinary study on the Lacustrine Kingdoms around the Titicaca basin (Lupaqa and Paqajes), and their interaction towards the western lowlands. Murra and Lumbreras were able to gather a group of leading Andeanists and students from Bolivia, Peru, Chile, Ecuador, Canada, and the U.S. who worked in the field for almost three months in Southern Peru, Northern Chile, and Bolivia. The Seminar, defined as a scholarly exercise to investigate about how the vertical archipelago thesis worked from the core area out became one of the most important attempt to integrate different research strategies dealing with ethnohistorical and historical documents, archaeological investigations, and ethnography. It represents a turning point in the development of Andean studies that contributed to advance further knowledge and theoretical issues about the Andean world.

[270] *Disturbing the Ancestors: Interpreting Early Intermediate Period Commingled Remains at La Iglesia, Huanchaco Perú*

While the Inca, Moche, and Chimu cultures boast grand sites along the north coast of Perú, much is to be learned about the earlier Gallinazo (50 BC/100 AD–500 AD) Salinar (200 BC–200 AD), and Cupisnique (ca. 1500–300 BC) cultures from small, coastal settlements. The 2017 field season of the Programa Arqueológico Huanchaco investigated these earlier Peruvian cultures during a five week excavation near the Iglesia de Huanchaco, approximately 15 km northeast of the Huacas de Moche. Initial ceramic analysis shows evidence for cultural occupation of Cupisnique through the Moche cultures. Within the lower strata of the Gallinazo occupation, two distinct contexts of layered, commingled human remains were discovered. Individuals are represented by varying degrees of completeness, from isolated fragments to crania and their associated cervical vertebrae, to fully articulated limbs. These two post-mortuary features provide evidence for Moche disturbance of Gallinazo burials. The excavation of these layered, commingled features will be described and basic demographic and health information will be presented. These data will allow for comparison of the two contexts and an examination of the implications of these features for understanding how Early Intermediate Period people interacted with their dead.

Rivera-Collazo, Isabel (University of California San Diego)

[135] *Coastal Erosion and Extreme Atmospheric Events: Climate Change and Coastal Cultural Heritage in Puerto Rico*

Islands and coastal zones preserve the cultural heritage of maritime traditions and livelihoods. The expected environmental impacts linked to climate change present a severe threat to their preservation, placing heritage at risk of being completely lost, possibly in an instant. Coastal cultural heritage in Puerto Rico has been the focus of research for the last two years, starting with a risk assessment, and continuing with plans for monitoring, documentation and possible intervention. However, the severity of climate change and the intensity of recent extreme events highlights the urgency of these tasks and outpace the research to document and preserve the contexts that have survived until now. This presentation provides an update on the work undertaken on Puerto Rican coastal heritage, contextualizing our progress within the effects that Hurricane Irma had on some of the known and threatened coastal heritage sites.

[201] *On the Right of Refusal: Decolonizing Archaeology and Equitable Praxis*

Fore fronting that "decolonization is not a metaphor" (Tuck and Yang 2012), this paper demonstrates how decolonization is not just an historical process but rather an action that is political at its core. As global efforts to redefine archaeological practice are underway to ensure a more just and equitable practice, political historiographies of colonial archaeology in high income postcolonies, such as the United Arab Emirates (UAE), must also be investigated. Epistemic violence embedded within colonial archaeology maintains itself under the guise of 'science,' as archaeology continues to make demands upon bodies, landscapes, memories, histories, and heritage.

This paper investigates what refusing to work in inequitable conditions might look like and what sorts of alternative pathways exist for an equitable and decolonized archaeological praxis. This will include entering archaeology (as a discipline) into transdisciplinary dialog with contemporary art and design. Engagement is not limited to a human to human interaction but rather, this paper will consider conceptual engagement as a key facet to epistemic rearrangements. Utilizing over five years of work with collaborators in the UAE, in this paper I will provide multiple formats through which ethical praxis emerged within frameworks of critical pedagogy, public engagement and archaeological practice.

[154] *Procurement and Use of Obsidian at the Middle Horizon—Late Intermediate Site of Quilcapampa, Valle de Sigüas, Arequipa, Peru*

This poster highlights emerging results of our ongoing study to further characterize the procurement networks and use strategies of obsidian sources in the south-central Andes during the Middle Horizon (600 CE—1000 CE) and Late Intermediate Periods (1000 CE—1476 CE). We present archaeometric analyses and provenience studies of excavated obsidian objects from the Middle Horizon—Late Intermediate site of Quilcapampa,

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

located in the Valle de Sigüas, Arequipa, Peru. In total, 70 objects were analyzed using handheld energy-dispersive x-ray fluorescence spectrometry (pXRF). Preliminary results demonstrate that the obsidian used at Quilcapampa originates from several distinct outcrop sources within the central Andean region, and particular attention is given to how obsidian procurement practices at Quilcapampa varied over time.

Roache-Fedchenko, Amy

[85] *Spatial Modeling of 18th Century Blacksmith Shops*

The location of blacksmith workshops is often noted on historic maps, yet the archaeological attributes of the workshops are often not well understood within the context of the 18th century. Most knowledge of blacksmithing derives from the 19th and early 20th centuries. The various tools and techniques used to produce and repair metal objects are well documented from these later time periods, as is the spatial layout of the blacksmith shops. These depictions of blacksmiths and blacksmithing are often idealized and not an accurate depiction of the archaeological attributes found on 18th century sites. This presentation explores the applicability of a general model for better understanding the ways in which 18th century blacksmithing spaces were used and how these areas become visible in the archaeological record.

Robb, John (Cambridge University)

[54] *The 20th Century Archaeology of the High Mountains: State Projects and the Forces Resisting Them*

The mountains of southern Calabria above 1400 m were used throughout prehistory and history, but except for an attempt to found highland agricultural settlements in the Greek period, they were always used for special purposes rather than as primary centres of habitation. The 20th century saw a massive transformation in land use, with intensive state investment in creating new kinds of mountain landscapes dedicated to special purposes. These purposes included political control, economic exploitation, and the invention of recreational worlds for use by urban dwellers (trekking, skiing, and more recently heritage landscapes). More populist initiatives included the development of religious landscapes of pilgrimage to local shrines, and ongoing bottom-up, informal exploitation of mountain places and resources. Archaeologically, some of these efforts proved successful (notably reforestation, creating a road network, and creating recreational landscapes). Others have proved less so, foundering upon long-term political and structural problems to create a landscape littered with the relics of a wide range of short-lived development projects.

[164] *Margaret Lyneis and the Pottery Traditions of Corn Creek and Ash Meadows in Southern Nevada*

Margaret Lyneis examined pottery collected from surface and excavation contexts at two of southern Nevada's desert oases, Desert National Wildlife Refuge and Ash Meadows National Wildlife Refuge. These rich islands of springs and lush vegetation were occupied fairly continuously from the Early Archaic period, with farming practiced during the Formative and Post-Formative periods. Dr. Lyneis' investigations demonstrated, for the first time, that pottery was made locally during the later periods, with temper for both gray and brown wares consisting of crushed rock obtained from adjacent mountains. This paper summarizes these studies and reflects on the implications of Dr. Lyneis' research for understanding Nevada's prehistory.

[180] *A Feasibility Analysis of Rock Art Recorded Thus Far for the Alexandria Project*

The Lower Pecos Canyonlands of southwest Texas is home to over 350 identified rock art sites depicting multiple styles, complexity, and intricacy. In 2017, Shumla Archaeological Research and Education Center launched the Alexandria Project, a three year mission to revisit each known rock art site in Val Verde County and perform baseline documentation, with the aim to answer overarching questions requiring a large and consistent dataset. Our documentation methods utilize Structure from Motion 3D modeling, high resolution gigapanoramas, specialized recording forms, and GPS coordinates. We are collecting a dataset intended for future research and analyses including stylistic variation, attribute identification, and iconographic interpretation. To examine the feasibility of conducting such analyses from baseline data, a test analysis was conducted using a sample of the sites recorded thus far. We conducted figure identification, stylistic classification, and iconographic inventory using only the recording forms, gigapanoramas, and 3D models processed from baseline data. This presentation discusses the results from the analysis along with what further research questions may be addressed from the Alexandria Project dataset.

[213] *'Finding the time': A Long-Term Perspective on Human Interactions with Tropical Landscapes and Its Implications for Sustainability*

Archaeology provides a truly long-term record of anthropogenic landscape interactions and human responses to environmental change. Such a record is particularly important in tropical settings that contain some of the most threatened terrestrial ecosystems in the world today. However, poor preservation and assumed human avoidance have meant that past records of human behaviour have been patchy for these biomes. Here, I review how new methodologies and archaeological interest has enriched datasets of human tropical forest use from the Pleistocene to the historical period. Alongside growing information relating to palaeoenvironmental fluctuations in different tropical regions, I seek to demonstrate that these datasets have much to offer modern conservation and policy-making in tropical regions. From documented millennia of tropical forest hunting, gathering, and burning alteration by hunter-gatherers to agricultural and urban populations surviving and collapsing through significant periods of climate change, I argue that a resource already exists for helping to understand problems facing human populations in tropical landscapes today. Archaeology and

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

palaeoenvironmental science can contribute to future predictions of climate change severity and tropical forest degradation, as well as potential solutions and mitigation practices, at a time when these regions are becoming ever more densely populated by our species.

[180] *Research Questions Driving Rock Art Recording Methodology in the Alexandria Project*

For over twenty years, Shumla Archaeological Research & Education Center has studied and promoted the preservation of rock art in the Lower Pecos Canyonlands along the U.S.-Mexico border. In July 2017, Shumla launched the three-year Alexandria Project designed to gather an extensive dataset from over 350 known rock art sites in Val Verde County, where the majority of US sites are located. Research questions driving data collection reflect two main aspects: geospatial distribution and iconographic content. Are there patterns in rock art site locations? Is there a correlation between other archaeological features and rock art? What are the distributions of key motifs across the landscape? Shumla will provide high-resolution data to better understand distribution, density, range, and context of Pecos River Style pictographs in addition to the lesser known pictographs styles and petroglyphs. This paper explores the Alexandria Project research questions and potential for future research.

[147] *Terminal Classic Terminal Deposits at Chan, Belize*

This presentation examines a series of terminal deposits at the ancient Maya farming community of Chan in Belize, Central America. We propose a contextual analysis of terminal deposits to facilitate the development of archaeological interpretations that move beyond the static category of "problematical deposits." The terminal deposits at Chan are located in its community center, primarily in two locations: in the eastern temple and southern range structure of Chan's central group. The deposits date to the period of the depopulation and abandonment of the community and are interpreted as terminal deconsecratory acts by the community's final residents. Most terminal deposits were placed on final structure floors and covered by collapse debris that accumulated through time. One unique terminal deposit, on the final structure floors of a diviner's room, was carefully buried in a lens of fine sascab suggesting that special care and attention was taken to "bury" the terminal deposits in this room. Examined in context, Chan's terminal deposits shed light on the uses of key buildings in a community center and illustrate how a dwindling population deconsecrated their buildings at the end of the occupation of a community.

Robinson, David (University of Central Lancashire, UK)

[214] *Sequencing the Gordian Knot: Implications of the Pleito Main Cave Superimposition Analyses*

The over-painting sequences at the elaborate rock-art site of Pleito, South-Central California, is one of most complex in the Americas. In a region famous for its polychromatic traditions, including Chumash, Yokuts, Kitanemuk, and other Californian native groups, Pleito stands out as the richest in terms of variety of colours, iconography, and over-painting. This over-painting, or superimposition, offers the 'deepest' data rich relative sequence in the region. Integrated work employing analytical and imaging techniques on the Gordian Knot project over the last few years has aimed to disentangle the sequences found in the Main Cave at Pleito by integrating analytical and imaging approaches. With over a dozen panels, multiple dozens of layers, and hundreds of elements, the results offers a unique view of change-through-time in the iconography of the wider region. As this project enters its final year, we present the first interpretation and implications of the Pleito sequence based upon this comprehensive approach.

[105] *Climate Change, Economies of Scale, and Population Growth in Prehistoric Hunter-Gatherer Societies: A Case Study from Southwestern Wyoming*

Increasing energy consumption returns, or economies of scale, have been illustrated similarly for modern urban societies and ancient complex societies. However, the relationship between underlying scaling relationships and the development and decline of population and social complexity over the long-term are yet to be investigated. This poster addresses their role in hunter-gatherer societies. Using formal mathematical models from macroeconomics, we examine the long-term variability of economies of scale in hunter-gatherer societies from southwest Wyoming throughout the Holocene. We compare means and variances in the scaling relationships between time-series datasets for population growth, social organization, housepits, ground stone, plant and faunal resources. These scaling relationships are then compared to paleoclimate records in order to investigate correlations between different economies of scale over time, population growth, and climate change. In particular, we investigate whether increasing variance in the underlying scaling of proxies for population, subsistence technology and social organization correlates with accelerating climate change and/or precedes major declines in prehistoric population. We develop a theoretical and methodological framework for research on the socio-ecological drivers of tipping points in prehistoric hunter-gatherer populations.

[158] *Registro y Documentación 3D de la colección de Piedras Grabadas de Monte Albán, una experiencia participativa entre la sociedad civil e instituciones*

Las estelas grabadas de Monte Albán, que forman parte del sistema de escritura más antiguo de América, se han enfrentado a serios peligros de deterioros a lo largo de su historia pasada y reciente. Elaboradas desde 500 a.C., se encuentran entre las más importantes de la escritura prehispánica de las culturas mesoamericanas. En 1994, se tomó la decisión de reunir la mayoría de estelas sueltas de los contextos no originales en una bodega provisional que causó resultados adversos. A partir de 2006 iniciamos un nuevo proyecto para su documentación y resguardo, con la participación del World Monuments Fund, la Fundación Alfredo Harp Helú Oaxaca, e insumos donados por el Gobierno de Japón, instancias que se unieron para ayudar al Instituto Nacional de Antropología e Historia en la tarea de protegerlas. Los resultados nos alientan a continuar en la búsqueda de participaciones extra-institucionales para proteger la memoria prehispánica de Oaxaca, y poder continuar con las investigaciones en torno a este importante tema.

Robrahn-Gonzalez, Erika (UISPP)

[331] *Building Societies of Knowledge*

This paper aims to analyze the implementation of integrative project designs developed with local communities in Brazil, in a bottom-up strategy. The objective is deliver relevant outcomes and outputs to society incorporating local social values to the process.

This strategy is also aligned to the development of UNESCO's Sustainability Science goals, from which archeology cannot be isolated. It considers the development of Cultural Environment Projects, where archeology research has more visibility and encourages more participation when integrated into wider scope studies. In such multi-variable projects, archeology is part of a “bigger picture” and is in dialogue with current issues advocating for integrative approach regulations.

Therefore, we must design methodologies and build an agenda, including:

- The development of an Applied Science, that allies the accomplishment of scientific research with the symmetrical involvement of local communities;
- The intensive use of technology not only to disseminate the research, but especially to increase the involvement of the communities in the construction of Knowledge Societies.

This perspective aims to link archeological evidence based on scientific findings to the history and identity of local communities, positioning archeology within the transdisciplinary studies that are necessary to meet the global challenges of the 21st century.

[163] *A Lithic Approach to Economic Organization at Piedras Negras, Guatemala*

Analysis of the production of imported lithic artifacts, especially obsidian and jade, has been important to recent research on the economic organization of the lowland Maya. However, the data for lithic production has come from a few key sites with clear evidence of workshops devoted to the working of such materials. Less attention has been dedicated to the diversity of obsidian and jade working within individual sites, much less across a given kingdom. This paper presents preliminary evidence for heterogeneity in obsidian and jade working in the kingdom of Piedras Negras, notable for being at the tail end in the exchange of obsidian, jade, and other imported lithic goods. The focus is especially on the diversity of production in household versus non-household areas, drawing comparisons with known market and production areas in Mexico and Guatemala, highlighting the connection with the subordinate center of Budsilha that yielded the best evidence to date for lithic production activities, to better understand regional economic dynamics. Macroscopic analyses are complemented by the results of XRF analysis.

[67] *Architectural Conformity vs. Slave Identity: An Example in Late Antebellum Georgia*

In 2015, Brockington and Associates conducted Phase III Data Recovery at a middle-nineteenth century field slave settlement within the Colonel's Island Plantation in Glynn County, Georgia. Excavations at five slave dwelling footprints showed that all exhibited nearly identical dimensions and construction techniques. Dwellings appeared to be double-pen wood frame with central chimneys and wooden floors. Rather than set off the ground by wood or brick supports, each dwelling was marked by a perimeter trench and series of eight-inch diameter vertical posts. The architectural landscape consisted of the placement of the double-pen dwellings in two rows of three, separated by an open activity area with open-air structures at either end. The architectural style was consistent with late antebellum efforts to improve slave health and productivity by providing better housing such as wood floors and sturdier dwellings. At the same time, settlement configuration and location were consistent with increased perceived need for control of the slave population amid more frequent news of slave runaways and rebellions. Despite the owners/overseers' efforts at control, our excavations

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

uncovered noticeable differences in artifact distributions among the dwellings excavated, revealing individuality within a slave community that is rarely if ever revealed in the historical record.

Rockman, Marcy (U.S. National Park Service)

[247] *Status Update on Archaeology in Relation to the Climate Change Movement*

Archaeology has many connections to climate change: damage and loss due to the impacts of changing environments, the capacity to provide insights for policy and decision-makers about the human processes of adaptation and migration, community connections to the past and the importance of place, citizen science, media coverage, and connections between heritage and identity in conflict, to name only a few. This paper overviews this range of connections and the importance of assessing where cultural heritage, historic preservation, and the field of archaeology particularly, stand in relation to global efforts to address climate change.

[275] *Native American Responses to Spanish Contact and Colonialism in the American South*

As it did elsewhere around the world, early Spanish exploration and colonization of the American South led to diverse forms of engagement, entanglement, diplomacy, and resistance by Native American groups. Community identity persisted in some places and in some instances, and it was transformed in others. Geopolitical relationships among towns and chiefdoms were altered in diverse ways, both because of colonial exploration, trade, settlement, and missionization, and because of Native American strategies for navigating new geopolitical landscapes and rapidly changing social geography of the colonial American South. This paper considers diverse outcomes to early stages of sixteenth-century Spanish contact and exploration and later stages of Spanish missionization and settlement in the 1600s and early 1700s, with reference to the cases of Cherokee towns in the southern Appalachians, the Calusa chiefdom and its neighbors in southern Florida, the Apalachee chiefdom in northern Florida, and sixteenth-century chiefdoms such as Coosa and Joara.

[181] *Coins and Empire in Sixteenth-Century Mexico*

Scholars have asked how empires solidify power when colonizers, the agents of empire-building, often have diverse goals and backgrounds and their actions do not necessarily support the goals of the empire. Two answers to this question have received much attention: that empires promote ideologies that support cohesion among colonizers, and that coercion and violence can promote the expansion of empires. I propose a third answer, in which colonizers create varied material forms that may challenge the goals of empire, but later appeal to the king for regulation and control over the material world. To study this proposition, I use the example of coins among Spanish colonizers in Mexico City. Colonizers invented and used a variety of coins, in part by diluting gold into different alloys to make up for the scarcity of gold that they found in the colonies. Thus, they challenged imperial authority by creating new ways of measuring value and wealth (in this case, by creating more wealth with diluted gold). But when they found that their new coins created problems of conversion and exchange, they appealed to the crown requesting regulations over the minting, value, and use of different coins, thereby strengthening imperial authority.

Rodriguez, Gonzalo (Proyecto Arqueologico Huari)

[300] *Replacing Houses and Building a City: Huari, Ayacucho*

Huari urbanism in the Middle Horizon (AD 500–1000) introduced several changes in the landscape and ways of life of people in the Ayacucho region. The construction of walled compounds, contiguous houses or orthogonal cellular architecture, and increasingly dense populations create housing needs that lead the Wari people to innovative solutions. The reduction of open space within internal courtyards, the construction of two- or even three-story buildings, and the probable use of pathways on top of wide walls are some examples. This presentation will compare two different patterns of room filling possibly related to building replacement at the beginning and end of the occupation of the study area, reflecting different approaches to using space in an increasingly urban place.

[330] *Living and Dying on the Fringes of the Sea. The Bioarchaeology and Archaeothanatology of the People of Vista Alegre, Quintana Roo, Mexico*

In this paper, we provide a synopsis of the two dozen burial findings from the archaeological site of Vista Alegre, Quintana Roo, recovered during a decade (2008 to 2017). Most of the mortuary contexts from Vista Alegre were documented using detailed in situ recording (archaeothanatology), followed by macroscopic and isotopic research in a collaborative effort between the Georgia State University and the Bioarchaeology Lab of the University of Yucatan. Put in context with other burial series from coeval coastal sites from the Yucatan, our present results showcase quotidian aspects of local lifestyle, diet and health risks, as experienced by the settlers of Vista Alegre. Here, sea products blended in with maize and other inland native staples as locals traded salt and other goods in the midst of growing social and economic networks along the shores of Yucatan. The second part of our talk addresses the deathways of locals, collective mortuary traditions and social identities of local folk, as showcased by cranial shaping and dental decorations.

Rodríguez, Carol (Pontificia Universidad Católica del Perú)

[69] *A Methodological Proposal for the Analysis of Style in Ceramics*

This study explores a recurrent problem in the archaeological field. How to start the analysis of archaeological material? Specifically, how to analyze a ceramic sample stylistically? Based on research carried out at the Cerro de Oro archaeological site on the south coast of Peru, the author proposes a methodology that covers identifiable aspects in most data groups. The study of decorative techniques, the identification of iconographic designs and the observation of distribution patterns will provide us with relevant and necessary information when developing investigations related to archaeological materials, particularly those that focus on the decoration of vessels. The objective of this proposal is to be useful for those researchers who follow this line of work and who need a starting point or alternative ways of approaching their data.

[304] *Human-Material Interactions during the Aurignacian of Europe, 35,000–27,000 BP: An Analysis of Marine Shell Ornament Distribution*

This research explores dynamic relationships between people and materials during the Aurignacian period of Europe, 35,000–27,000 BP. More specifically, a network analysis is used to determine whether there are discernible patterns in the geographic distribution of marine shells used for the creation of beads and pendants. As early inhabitants of Europe moved across the landscape they came into contact with others and left behind material traces of these interactions. Whether these artifacts came to be deposited through processes of migration or exchange, marine shells are particularly useful for exploring these processes, as their presence far from the sea can be indicative of dynamic interactions between materials, individuals, and groups.

Through the use of social network analysis software called Gephi, this research visually maps the interactions between sites and regions based on the genera of marine shells present. By creating network visualizations that are analyzed mathematically, in addition to geographic maps of site locations, patterns in the interactions within which materials and people were embedded and entangled are explored. Engaging with theories of materiality, this research sheds light on the active role of marine shell ornaments in the complex interactions between individuals and groups.

Rogers, Thatcher (University of New Mexico)

[21] *The Northern Periphery of the Casas Grandes World: An Assessment and Update of the Animas Phase*

In the 1930s through 1960s, several sites in southeastern Arizona and southwestern New Mexico were excavated to assess their role in a regional system that spanned across the international border. Many of these sites were characterized by their shared, mixed composition of architectural, ceramic, and iconography traits that did not neatly fit into established archaeological cultures. Subsequently, they became the basis of understanding for the northern Casas Grandes frontier, oftentimes termed the 'Animas Phase'. More recently over the past thirty years, significant progress has been made in understanding the character and extent of the Medio period Casas Grandes culture. However, these new changes in understanding have seldom been applied to the Animas phase assemblages analyzed and site interpretations constructed. This paper reassesses the use and meaning of the Animas phase in response to these developments and seeks to understand incorporated sites not only as a Paquimean 'hinterland', but on the local scale as multiethnic communities integrated into several socio-cultural networks spanning across the borderlands.

[48] *Cultural Changes during the Protohistoric Period: An Oneota Case Study*

George Milner points out in his 2015 work, "Population Decline and Culture Change in the American Midcontinent: Bridging the Prehistoric and Historic Divide", that reactions and changes by Native Americans during the Protohistoric period were highly localized, and that each tribe was affected differently through direct and indirect contacts with Europeans. The La Crosse locality was inhabited by the Oneota until c. 1625 when the area was abandoned for the Riceford Creek locality (in southeastern Minnesota). This study looks at how the Oneota were affected by European presence on the continent, even before direct contact was made. We see evidence of stress in a change in settlement patterns between La Crosse and Riceford to more protected areas, more utilitarian ceramic vessels, the abandonment of key resources (e.g. wild rice, large river fish, large river mussels, etc.), and an increase in catlinite pipes. During the Protohistoric period, we see the Oneota shifting to a more protective and secluded stance.

Roldan, Jonathan, Marisol Cortes-Rincon (Humboldt State University) and Abby Barrios (Humboldt State University)

[118] *Digital Preservation Era: A Toolbox for Archaeologists to Transition into the Digital Age*

Digital tools, such as photogrammetry and virtual environments have been around for decades. However, it was not until the past decade that the academic community introduced such tools into their work and have taken such discipline seriously. For this reason, the practice, management, teaching and potential of digital archaeology has remained a lagging field. As a response, this paper will provide a guide for traditional archaeologists to assist in the transition to the digital medium. An introduction to the essential vocabulary, theories and must know phases are provided in the paper. In addition, methodologies for a successful digital documentation, preservation and curation are given. Since such discipline is at its infancy in the academic world, we will address the advantages and disadvantages of this new type of data acquisition and post-processing. A complete description of available tools that will advance research questions, interpretations and communication in archaeology is presented here as well. Like any innovation, issues and concerns arise; common and noteworthy issues will be summarized.

[330] *Vista Alegre: The Architecture of a Coastal Site in Northern Quintana Roo, México*

El Proyecto Costa Escondida, dirigido por Jeffrey Glover y Dominique Rissolo, ha realizado investigaciones en la costa norte de Quintana Roo, México desde el año 2005. El sitio de Vista Alegre está ubicado en una pequeña isla dentro de la laguna de Yalahau, formó parte de los asentamientos costeros que, a lo largo del litoral de la Península de Yucatán, mantuvieron una circulación de bienes durante la época prehispánica. Estos sitios presentaron y compartieron algunas características arquitectónicas de acuerdo a las regiones y a los distintos periodos. En este trabajo mostramos un estudio comparativo de la arquitectura presente en el sitio de Vista Alegre con relación a la de otros sitios costeros y de la región. Consideramos que, mediante esta comparación, podremos tener un mejor entendimiento sobre algunos de los procesos culturales de los habitantes de la costa norte de Quintana Roo durante el periodo Formativo Tardío y el Postclásico.

Romih, Stanislava (Northern Arizona University) and Rafael Guerra (New Mexico University)

[18] *Unleashing the Beast: New Methodologies in Exploring Peri-abandonment Deposits in the Maya Lowlands*

The BVAR project recently renewed its investigations of peri-abandonment deposits at several sites along the Belize River in Western Belize. Also referred to as de facto refuse and problematic or sheet-like deposits, these cultural remains are predominantly recovered in palace rooms and courtyards in site cores across the Maya lowlands. The purpose of the BVAR investigations is to better understand the formation of such deposits as well as their temporal and spatial significance across sites in the Belize Valley region. To accomplish these goals, the project employs microstratigraphic excavation methods that utilize subplot systems for more comprehensive analysis of the assemblages of individual deposits. This paper describes our methodological approach in greater detail, and presents preliminary results of our investigations of terminal deposits at the site of Lower Dover in western Belize.

Rondeau, Michael (Rondeau Archeological)

[120] *Far West Fluted Points: Variability and Trends*

The CalFLUTED project has studied hundreds of Far Western fluted points allowing for a wide ranging recognition of the variability and trends in fluted point morphology, manufacturing technology, use breakage, repair and hafting techniques in the region. Conclusions are supported by study data. Discussion of the implications of those conclusions is provided.

Rondeau, Rob (Simon Fraser University)

[78] *Archaeological Geovisualization Underwater*

New research continues to challenge the "Beringia" explanation of the peopling of the Americas. During the Last Glacial Maximum sea level in the Gulf of Alaska was approximately 100–120 meters lower than present. Vast areas of adjacent coastline extending south along the Pacific Northwest Coast may have been deglaciated beginning about 16,000 BP; providing a coastal corridor for people using watercraft to move south along the coast from eastern Beringia. The focus, now, is locating a coastal migration route. How would one locate early New World archaeological sites underwater?

Underwater surveying techniques, developed in collaboration with related scientific disciplines such as Geophysics and Oceanography, continue to improve the spatial understanding of undersea environments. I refer to this next generation of marine archaeology as "underwater archaeological geovisualization" (UAG).

This paper outlines research focused on new underwater remote sensing technologies, incorporating new computing sciences; such as three-dimensional (3D) imaging, virtual reality (VR), geographic information systems (GIS) and agent-based and virtual modeling, in conjunction with applied technical engineering; developing new underwater remotely operated vehicles (ROVs).

UAG will allow archaeologists to both predict and locate submerged ancient occupational sites as well as investigate these in a way not previously possible.

Ronsairo, Karleen (The George Washington University)

[288] *A Preliminary Analysis of Early Ramos Phase Ceramics from the Mixteca Alta, Oaxaca, Mexico*

During the Late Formative period, social relations were transformed due to increasing political centralization and urbanization in regions throughout Oaxaca. In the Nochixtlán Valley of the Mixteca Alta, Early Ramos phase (300–100 B.C.) ceramics from urban centers in the region reflect significant stylistic change from the preceding Yucuita phase (500–300 B.C.) ceramics. This presents an opportunity to explore how social change may be reflected in stylistic changes of material culture from this period. Changes in ceramic styles in this region, as well as the social practices associated with ceramic production, consumption, and exchange, can be considered to provide a more nuanced view of social change during the urban transition in Late Formative Oaxaca. I conducted visual analyses of Early Ramos phase ceramics from Yucuita and Etlatongo in the Mixteca Alta, which provide a foundation for comparative analyses of ceramic styles and paste compositions of Early Ramos phase ceramics from other Late Formative sites in the region. Future stylistic and paste compositional analyses of these ceramic collections will provide insight into the urban dynamics within the Mixteca Alta and the nature of social relations between urban centers in regions throughout Late Formative Oaxaca.

Roos, Christopher (Southern Methodist University) and William Hockaday (Baylor University)

[182] *Late Pleistocene and Early Holocene Biomarkers from Stratified and Cumulic Soils in Highland Environments of the Jemez Mountains, New Mexico*

Through his meticulous work on stratified and buried soils, Vance Holliday has transformed our understanding of Paleoindian environments in the lowlands of the Southwest and Great Plains. Inspired by Vance's example, we have used a geoarchaeological approach to explore Paleoindian visitation and use of highland environments. Paleoindians have been visiting the Jemez Mountains for obsidian since at least the Folsom period. However, direct archaeological evidence of their presence in and use of highland environments of the Jemez Mountains has not yet been discovered. We use lipid biomarkers extracted from stratified and cumulic soils to reconstruct highland plant communities of the Late Pleistocene and Early Holocene in what are now ponderosa pine forests (2,200–2,600 m). Furthermore, we use fecal biomarkers to infer properties of the Terminal Pleistocene mammalian fauna that may have attracted Paleoindian foragers to the highlands and ultimately to the high-quality obsidian.

[177] *Large Centralized Fired-Clay Cooking Stoves of Communal Households on Marajoara Mounds at the Mouth of the Amazon c. AD 400–1100*

Rarely does the New World anthropological literature mention the existence of large centralized, multi-unit fired clay cooking structures of some prehistoric or recent indigenous Amazonian households. Yet these large, highly patterned features have been informative for archaeology from several points of view. Their existence and common presence as permanent structures built into the floors of prehistoric mound sites on Marajo Island have demonstrated that the mounds they occur in had sizeable, long-term domestic occupations as well as ceremonial remains. Until their discovery, the mounds were assumed to be purely ceremonial monuments. The strong magnetic signatures of stove groups allow them to be mapped by surface geophysical survey, giving potential settlement footprints and thus evidence of site populations and organization, as well as maps to aid excavations. Excavations at and around the structures revealed by geophysical survey revealed that they were set into housefloors, and the extent of the floors indicated that the houses must have been large, multifamily dwellings, a form still common in Amazonia at present. Further useful evidence from the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

excavations has been the identification of small fish and cultivated palm fruits as a staple foods and vegetation patterns with more forest cover than at present.

[83] *Precontact Coast Salish Seasonality in Social Networks: A Modeling Approach*

A crucial aspect for examining the production and reproduction of material culture among complex foraging societies such as those of the Pacific Northwest Coast is understanding the relationships between social networks and assemblage diversity. This model examines one small aspect of this issue, seasonal variation in social network size. The model is ethnographically informed by Coast Salish ethnographic household sizes. Assemblage richness and evenness in discrete artifact styles are examined under random social learning, varying seasonal social network size and innovation rate. Larger seasonal aggregations appear to result in a higher frequency of rare types, but this effect is not significant enough to strongly pattern the record of interest. Changes in innovation rate appear to also overwhelm any signals in this aspatial model from differing social network sizes through seasons.

Roscoe, Paul (University of Maine) and Alice R. Kelley (University of Maine)

[84] *Middens or Monuments? The Shell Middens of Maine and the Construction of Peace*

Although some attention has been given to the possibility that circular, semi-circular, and U-shaped piles of shell in southeastern North America represent monumental architecture (e.g., Thompson and Pluckhahn 2012), little attention has been afforded to the possibility that large shell middens of the eastern North American coast might be monumental constructions. Here, using an argument drawn from New Guinea ethnography, we hypothesize that some Maine middens were not simply rubbish heaps, but conspicuous constructions that, among other things, maintained peace among neighboring aboriginal polities.

Behavioral ecologists theorize that, as honest signals of fighting strength, threat displays and ritualized fighting are information-gathering devices that allow both parties to a conflict to establish the victor without either having to risk the potentially catastrophic costs of serious fighting (Enquist and Leimar 1990). Analogously, we propose, some Maine shell middens were indexical signals of a polity's fighting strength that helped maintain peace by mediating inter-polity conflict. As signals of consumption, scale of feasting, and available food resources, the middens broadcast the number of members and allies a polity could muster, as well as their commitment to its projects. The hypothesis gains support from the distribution of both middens and their contents.

Rose, Alexa and Michael E. Smith (Arizona State University)

[49] *Almenas and Architecture*

Almenas, roof ornaments comprised commonly of ceramic or stone in Teotihuacan that most archaeologists toss aside unknowing of their identity, have been a source of research in archaeology recently after Michael E. Smith and Clara Paz Bauista's paper "Las almenas en la ciudad Antigua de Teotihuacan" in 2015. Continuing Dr. Smith's original research, I have compiled a database of complete almenas from museums and published resources to make new categories for the artifacts. Although many whole almenas are within museums and published sources little is known about their significance. Given the complete roof ornaments, I could reevaluate the pieces Dr. Smith originally studied and give less subjective categories to as well. Then Dr. Smith and I analyzed the information known spatially about the roof ornaments to denote if these almenas truly do, as previously thought, denote building function. Dr. Smith and Paz showed in their paper that almenas were widespread in Teotihuacan and associated with several distinct types of structures. The database of whole almenas permits new hypothesis about how these artifacts signal functions continuing with Dr. Smith's work. This research will assist in defining building function and give clearer categories to these artifacts to aid future archaeologists.

Rose, Katherine (Harvard University)

[40] *Legitimizing Nearness: Negotiating Identities in the Spatial Design of 25th Dynasty Nubian Cemeteries*

Ancient Egypt is characterized as a highly centralized and dominating state. However, following the disintegration of the New Kingdom in the 11th century BC, division of state and conquests by foreign rulers ushered in a period of economic decline and political instability. The fracturing of dominion continued until the 8th century BC, when the Nubian kingdom of Kush unified Upper and Lower Egypt into the geographically largest empire since the New Kingdom. The Nubian pharaohs began construction of necropolises near the Fourth cataract of the Nile. While Kush material culture in the form of royal statuary and temple architecture indicates a reaffirmation of classical Egyptian practices, what is the relationship between Nubian and Egyptian royal identity on a landscape level? This research represents a study of the design and utilization of space in mortuary landscapes of the Nubian pharaohs. This project focuses on spatial analyses of the sites of El-Kurru, Nuri, and Gebel Barkal. The Kushite kings deliberately appropriated the Egyptian architectural symbol of the pyramid and other styles in the construction of royal mortuary landscapes. However, the formation and maintenance of royal identity manifested differently in the design and utilization of built landscapes, across the various periods.

Rose, Nicole (The Graduate Center, CUNY)

[196] *Corroded but Enduring: On the Perpetuation of a Scholarly Iron Curtain in Western Archaeological Thought and Practice*

Archaeological schools of thought vary between countries, with the discipline growing along disparate theoretical trajectories dependent on the historical particulars of a nation's academic traditions. Often distance between such diverging theoretical trajectories is mitigated by communication and collaboration across borders between scholars. However, the Cold War that divided Western and Soviet nations geographically, politically, and culturally also applied to archaeological research, as the flow of information and people across borders was stifled. Despite the collapse of the Soviet Union in 1991 and the mostly normalized relations that developed afterwards, a scholarly Iron Curtain has remained, diminished but enduring. Though certainly not as rigid as decades past, such a divide is visible in the limited number of American scholars conducting research in modern Russian, and in the exclusion of Russian research from our narratives about the prehistoric and ancient past. This paper examines the legacy of the Cold War in American archaeology, specifically in relation to the marginalization of Russian archaeological phenomena in our popular narratives. Ultimately, the peripheralization of these phenomena and regions does not result from anything that existed in pre- or ancient history, but in the modern political and cultural context's shaping of archaeological thought and practice.

Rosen, Arlene [259] see Dawson, Emily

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Rosencrance, Richard (University of Nevada, Reno)**[47]** *New Data and Potential Pathways of Paleoindian Exploration in the West Virginia Highlands*

Comparatively few Paleoindian artifacts have been found throughout the Appalachian Highlands, especially in the uplands of West Virginia. Lack of professional research in West Virginia appears to be the leading cause for this paucity of data. A literature review and newly identified artifacts from surface collections provide a baseline for future research questions and survey strategies. Most artifacts derive from the Ohio and Kanawha river valleys, but new artifacts from the most mountainous portions of the state suggest that early groups also utilized interior river valleys and uplands. The Tygart and Greenbrier valleys are the largest of these interior river systems, and are most accessible by following waterways out of the lower elevations of the Ohio valley to the west. This research identifies high probability areas for Paleoindian sites in the West Virginia highlands based on artifact distribution, topography, hydrologic systems, and lithic raw material sources.

Rosenfeld, Silvana (University of South Dakota) and Megan Street (University of South Dakota)**[335]** *The South Coast and Yungas as Seen from the Highlands during the Middle Horizon*

In this presentation we will discuss different non-local materials recovered from the Wari site of Conchopata and the imperial capital of Huari to better understand the interactions between costa, sierra, and selva during the Middle Horizon. The mapping of the origins of exotic material recovered at these sites will help us understand and better characterize how people in these regions were interacting with each other. By exploring least-cost pathways, among other criteria, we will make inferences on the possible exchange routes used in a diverse landscape marked by many topographic changes during this important time period.

Rosenswig, Robert (University at Albany)**[109]** *Is the Study of Ancient Money Really So Difficult?*

The difficulty that many economists and anthropologists have with studying ancient money lies with inadequate understanding of modern monetary systems. I briefly review the establishment of two currencies: the British pound in the 18th century and the US dollar in the 19th and why the establishment both currencies were political (not economic) constructs. Modern Monetary Theory (MMT) economists analyze the current fiat currencies as political constructs and David Graber's Debt: The First 5000 Years provides a historical perspective that undermines classical and neo-classical economists' assumptions of the subject matter. Most discussion by both economists and anthropologists are limited to written accounts. Therefore, I next turn to our ability as archaeologists to investigate money in Prehistoric contexts and employ the Formative-period kingdom of Izapa (800–100 BC) and the early cities on the Pacific coast of Mesoamerica as forum for this to be done.

Rosenthal, Jeffrey [44] see Morales, Jessica

Rossi, Franco (Boston University)**[110]** *Monuments that Weren't: Reckoning with Unmarked Histories of Violence*

With recent events in the United States, monuments and their powerful implications have been widely covered across media outlets. Less often considered, however, are the monuments that were never built in the first place. This paper grapples with these questions archaeologically, ethnographically and historically by considering monuments and memory through extremely well-explored cases in Bavaria and through other far less discussed cases in the Northeastern U.S. It considers the historical narratives that American public school students grow up learning in relation to monuments and material markers, and discusses potential pedagogical approaches for exploring histories of monuments that never were. Drawing from Indigenous theories of settler colonialism, it seeks to probe possibilities for how future memory work might be envisioned as part of archaeological teaching and public engagement.

[110] *Chair***Ross-Sheppard, Callan (McGill University)****[246]** *Discussant***Rostain, Stéphen (PhD. National Center for Scientific Research, France)****[116]** *Upano, an Anthropized Valley in the Upper Amazon*

Sangay, Ecuador, is probably the most prestigious and impressive site in Amazonia. It is indeed an immense establishment regrouping dozens complexes of artificial earthmounds and a network of endless paths dug along the edge of a terrace of the left bank the Upano. Many archaeological sites have been found in this narrow and straight Upano Valley has been modified over tens of kilometers in length by the pre-Columbian, but few of them have been excavated. Does this multitude of interconnected sites correspond to a central power or a swarm of small local chiefs? This presentation will show the main types of monumental modifications, their chronology from the Formative period to the European conquest and the assumptions that can be made on the pre-Columbian societies that carried out these earthworks.

[116] *Chair***Roth, Barbara (UNLV)****[122]** *Ash Matters: The Ritual Closing of Domestic Structures in the Mimbres Mogollon Region*

Throughout much of the Southwestern U.S., ash was an important component of ritual deposition and has ethnographically been closely associated with processes of cleansing and renewal. The presence of ash in ritual contexts is well documented, but it also appears to have played an important role in the closing of domestic structures. In this paper, I present cases of ritual closure of domestic structures and examine the role that ash played in these closures using data from pithouse sites in the Mimbres region of southwestern New Mexico. These data show that ash was an important component of the abandonment and closure of domestic structures throughout the Pithouse period. I explore the reasons for the use of ash in these contexts and the relationship between domestic and ritual closure during the Pithouse period.

Roth, Barbara [325] see Baustian, Kathryn

Rotman, Deborah (University of Notre Dame)**[220]** *Collective Labor, Communal Lives: Social Dynamics of 19th-Century Rural Life in Northwest Co. Mayo, Ireland*

Nineteenth-century tenant families on the Bingham Estate and throughout rural Ireland resided in cottage clusters known as clachans, nucleated groups of farmhouses, where land-holding was communal and often had considerable ties of kinship. These settlements were intimately associated with rundale farming, a system of cooperative or collective agriculture. This system was a sophisticated response to specific ecological conditions.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Lands within infields, outfields, and commonage were allocated so that each household received a proportionate share of productive and non-productive land. Thus, each community was highly adapted to its unique environmental niche. These settlements were also highly complex social

organisms. Children kept cattle away from the gardens, cut and planted potatoes, and gleaned fields where grains were harvested. Women provided for the children, carded and spun wool, and tended to the household. Men were responsible for the management of farm lands. Thus, activity within each clachan and rundale was shaped by gender and age. Although maligned as 'backwards' and 'primitive,' clachans were in fact well-orchestrated socio-economic systems that distributed the risk of agricultural production among its members. This paper explores the social dynamics of these fascinating gendered landscapes.

Rowan, Yorke (University of Chicago) and Austin Chad Hill (Dartmouth College)

[4] *Droning On: UAV Survey in the Black Desert of Jordan*

In this paper we discuss preliminary results of UAV-survey in one area (c. 32 sq. km.) along the Wadi al-Qattafi, Jordan as part of the larger Eastern Badia Archaeological Project. Excavation and survey in this area of the Black Desert revealed hundreds, or possibly thousands, of unmapped and unrecorded structures that required a new approach to their accurate identification and documentation. With the exception of the large desert 'kites' (hunting traps), most stone structures are too small to map effectively using satellite imagery, and too sparsely distributed to map efficiently with traditional terrestrial survey tools. Our results reveal new insights into the distribution of kites, buildings, and other structures in this area. In addition, we note how this mapping project will affect our future research directions, and the challenges drones present for documenting the cultural landscape in this remote region.

Rowe, Ann (The Textile Museum, George Washington University)

[139] *Reconstructing the Inca Occupation Period in Chancay*

Comparatively little excavation information is available from the Chancay valley, particularly pertaining to textiles, which are abundantly preserved there. Yet, it turned out to be possible to identify in museum collections, including that of the NMAI, two distinct styles of highland tunics found at sites in the mid and lower Chillon valley and vicinity that in turn influenced mid-valley and coastal tunics, particularly Chancay-style examples. Moreover, textile designs made it possible to date these tunics to the Inca-occupation period. The identifications were based on technical analysis and the use of site provenience information as well as design comparisons. The conclusions were subsequently confirmed by textiles in a grave lot from the Chancay valley excavated in 1904 by Max Uhle, kept in the Hearst Museum of Anthropology in Berkeley, whose ceramics show no Inca influence. The tunics reveal that people from the upper valley in Chillon probably had some administrative role during the Inca empire in Chancay, and that textiles reflected the imposition of the Inca administration in Chancay to a much greater extent than ceramics.

Rowe, Marvin [74] see Blinman, Eric

Rowe, Sarah (University of Texas Rio Grande Valley)

[196] *Periphery and Perspective: The View from Late Prehispanic Coastal Ecuador*

The small country of Ecuador is sometimes categorized as part of the Andean cultural region and sometimes included in the Intermediate Area. Located as it is next door to archaeological behemoth Peru, Ecuadorian archaeology has frequently been overshadowed by that of its neighbor. Banal oversights, such as maps that show the Inca Empire stretched across the Ecuadorian coast, serve to emphasize the subordinate position of archaeology in the country to the north. Periphery, however, depends on perspective. The central role of ancient Ecuadorian trade networks in supplying the rare materials required for ritual and social life (*Spondylus* shell, specifically) is often acknowledged but rarely examined. In this talk I explore the historical subordination of Ecuadorian archaeology, and outline what may be gained by centering the archaeology of coastal Ecuador within larger archaeological and anthropological discourses. Specifically, I outline the novel forms of social organization that characterized the late prehispanic Manteño tradition, and examine the potential of these forms to rethink and enrich our understanding of other societies in the region.

[190] *Revealing Ritual Landscapes at Hopewell Culture National Historical Park*

Hopewell Culture National Historical Park preserves six monumental mound and earthwork complexes in south-central Ohio. Archaeological attention in the 19th and 20th centuries remained narrowly focused on mounds and mortuary contexts, ignoring the vast spaces between the monuments. At the same time, agricultural plowing steadily eroded the above-grade features. Recently, the National Park Service forged an international partnership to conduct high-resolution, landscape-scale geomagnetic surveys in collaboration with the German Archaeological Institute, SENSYS GmbH, Bournemouth University, and Ohio Valley Archaeology, Inc. This poster presentation will present highlights from the nearly 500 ha surveyed, along with the results of targeted ground-truth excavations. These investigations are revealing subsurface landscapes of unexpected integrity and complexity, marked by ditched enclosures, wooden post circles, communal earth ovens, and other previously unknown ritual architecture.

Ruhl, Donna (Florida Museum of Natural History)

[89] *Isotopes & Curation: New Lessons Learned from Legacy Waterlogged Wooden Artifacts*

A pilot study was conducted to test the feasibility of applying strontium isotope analysis to source the origins of archaeological "canoe trees" tested to make pre-contact dugout canoes spanning some 5000 years. Many canoes collected decades ago from Florida's lakes produced unexpected signatures. These results raised further questions about the methods' feasibility and the impact of past preservation approaches to the curation of waterlogged wooden artifacts. The anatomical nature of wood cells from legacy samples along with modern proxies was analyzed and experiments indicate the highly hygroscopic nature of wooden log boats/dugouts/canoe trees. New considerations regarding these "wooden sponges" and the potential preservation/conservation for these unique waterlogged remains and the isotopic research will be the focus of this presentation.

Ruhl, Erika (University at Buffalo) and Sanna Lipkin (University of Oulu)**[25]** *Though we walk through the valley of the shadow of death: Co-burials and Identity in Pre-modern Northern Finland*

This paper specifically addresses the cultural construction of children's age and identity by examining the textiles and burial clothing from a series of pre-Modern mummified children's burials recovered from beneath church floors in northern Finland.

During the pre-modern era, children's burials in pre-modern Finland take one of three forms: (1) alone, in individual coffins (2) in association with other burials but still in their own coffin (3) co-burial, in the same coffin as others. This project specifically considers the temporal, geographic, and religious variations which impact these burials.

Pre-Modern Finnish identities; of "child" and "adult", "male" and "female" are explored through the detailed analysis of the garments with which these children were interred. This also offers the opportunity to consider what childhood meant vis-a-vis adult society, particularly in cases of co-burial. The roles to into which children were enculturated, and the unique boundary between "dead" and "alive" are explored through role identity theory, socialization theory and material and technological choice in the funerary textiles and manner of burial.

Rumberger, Jacklyn (University of Central Florida), Arthur Joyce (University of Colorado, Boulder), Sarah Barber (University of Central Florida), Stacie King (Indiana University, Bloomington) and Guy Hepp (California State University, San Bernardino)**[306]** *Comparing Isotopic Data for Diet and Mobility of Males and Females in the Lower Río Verde Valley, Oaxaca, Mexico*

This poster presents a comparison of the isotopic data from male and female individuals interred in the lower Río Verde Valley of coastal Oaxaca, Mexico from the Early Formative period, beginning in 2000 BC, to the Early Postclassic period, ending in AD 1100. Our previous work in this region has focused primarily on broad dietary changes through time, focusing little attention on comparisons by sex. Our sample for the present study includes 54 individuals: 31 males and 23 females. These individuals were buried at the sites of La Consentida, Cerro de la Cruz, Charco Redondo, Yugué, and Río Viejo—all of which are located in the lower Valley. With this poster, we aim to fill a gap in previous research by investigating inequality, access to resources, and mobility patterns between males and females. We base our findings on evidence from the study of stable carbon, nitrogen, and oxygen isotopes. Employing a sample that spans nearly three thousand years gives us an opportunity to observe changes and continuities in inequality, subsistence, and mobility over time.

Runnels, Curtis (Boston University)**[200]** *Discussant***Running, Garry (University of Wisconsin-Eau Claire)****[182]** *Sand, Rivers, Glacial Lakes and the Prairie-Forest Border: A Doc Holliday Student Heads North*

In this paper I link ongoing research along the eastern shore of Glacial Lake Agassiz (GLA) to Doc Holliday, the person who made it possible. Doc instilled in his students an interdisciplinary mind-set, and taught them to emphasize archaeological questions first and to consider past human groups as active agents of paleoenvironmental change as well as sophisticated responders to it. My research up North began where the ancestral Sheyenne River entered GLA from the west. After patient mentoring from Doc, results of that work suggested that such geomorphologically complex places are, in turn, ecological complex, exhibiting a tight mosaic of ecotones and microhabitats that provided a rich resource base attractive to prehistoric peoples. Later, the interdisciplinary SCAPE project (Study of Cultural Adaptations in the Prairie Ecozone project), was organized to apply that Holliday-inspired model. Doc's model was fruitfully applied in many localities along the prairie-forest border, from Alberta to Manitoba. Now, twenty-six years later, and once again working along the shores of GLA, I am introducing a new generation of researchers to the Holliday way of doing things, from his interdisciplinarity and generosity to students and colleagues, to his singular lunch menu and use of movie lines for field communication.

Ruscillo, Deborah (Washington University in St. Louis)**[298]** *Hunting the Helmet: Social and Practical Aspects of Building a Boar's Tusk Helmet*

From the earliest occurrence of the boar's tusk helmet from Grave Circle B at Mycenae (ca. 1650BCE) to the latest from a sub-Minoan tomb from the North Cemetery at Knossos (ca. 1000BCE) presents a span of 650 years of reverence for this important accessory of Bronze Age warriorhood. Depictions and copies of this helmet in other cultures, including in the Hittite, Egyptian, and even later Roman cultures, demonstrate its pervasive and deeply respected meaning. Helmets of this kind were known to have been passed down through generations and even stolen and gifted. Homer describes one helmet being passed through seven hands before finally ending up on the head of Odysseus. All this raises the question of why warriors did not make their own helmets. What was it about the production and ownership of these helmets that was so special? Why did this type of helmet develop a romantic and timeless reputation in art and stories? The assemblage of broken tusk refuse from Iklaina provides a unique opportunity to explore the techniques involved in the making of a helmet. Microscopy of tool marks and experiments on modern tusks will embellish the information we have on how the illustrious helmets were made.

Russell, Nerissa (Cornell University)**[121]** *Guardians in Life and Death: Dogs at Neolithic Çatalhöyük and Beyond*

Dogs often occupy a spiritually ambiguous position in human-animal relations. Domestic but not livestock, they typically share human space and diet more than most herd animals. They are more likely to be considered persons, with souls—a trait they share with wild animals. Here I examine the spiritual status of dogs in early Near Eastern herding societies, as livestock-keeping spread through the region and it became possible to situate dogs in relation to other domestic animals as well as wild ones. I rely primarily on data from Çatalhöyük in central Anatolia, where I have extensive contextual information, supported by patterning from other PPNB/early Pottery Neolithic sites. Drawing on the contextual analysis of animal bones, burial practices, and animal representations, I argue that dogs were not regarded in the same way as wild animals, but that they held greater spiritual power than domestic sheep and goats. This power is evident through taboos: on human consumption of dogs, and on dogs entering occupied houses. However, dogs lived near specific houses, and in death their primary role was the protection of houses and their dead human inhabitants, rather than of individual humans.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Rutecki, Dawn (Grand Valley State University)**[81]** *Movement and Places Between: The Power of Raccoons*

Informed by ethnographic accounts, iconography has helped clarify how people materialized otherwise intangible aspects of their realities. In this paper, I examine the use of raccoons in imagery from Mississippian archaeological contexts. By considering placement of independent raccoon motifs in iconographic scenes, as well as raccoon motifs associated with figures, I identify use patterns of raccoon imagery. Considering these iconographic data alongside faunal data generated from Spiro, Oklahoma, I argue that associations between raccoon motifs and other images, such as the Striped Pole Motif, suggest that raccoons may be associated with movement between the Middle World and other places. In addition, I suggest that considering possible links between the ability to access or wield this power materialized through use of raccoon bindings in various scenic constructions provides an opportunity to center indigenous ontologies in interpretations of material culture.

The discovery of numerous Maya-style mural painting fragments during the archaeological excavations in the Plaza of the Columns Complex of Teotihuacan, sprouted debates concerning if these murals were drawn by a Maya artist. In order to compare the pigments composition and the pictorial technique of these paintings with mural paintings from the Maya area from the Classic Period, a non-invasive characterization of the thin ground layer of stucco and the pigments used in the painting discovered in Teotihuacan was carried out. The color palette shows red, yellow, blue, green, black and white pigments. First a False Color Infrared Imaging method combined with Optical Microscopy was used to contrast the pigments. Afterwards, several spectroscopic non-destructive techniques (X-ray fluorescence, Fiber Optic Reflectance and Raman Spectrometries), as well as Scanning Electron Microscopy (SEM-EDS) were applied for pigment identification. The main results of this comparative study are discussed in order to understand the degree to which local or non-local pigments were utilized by the artist in question.

Ryan, Christopher (Vandenberg Air Force Base), Rick Bury (Rock Art Documentation Group), Jon Picciuolo, Antoinette Padgett (Rock Art Documentation Group) and Dan Reeves (Rock Art Documentation Group)**[214]** *Illuminating Event-Based Significance at Three Rock Art Sites on Vandenberg AFB, CA*

Although we now have highly technical equipment that allows analyses and observations of rock art in new ways, this should in no way diminish pursuing our personal sense of curiosity, ability to develop hypotheses out of hunches, and test those hypotheses as best we can, to discover layers of significance for a rock art site that no piece of equipment would ever be capable of detecting. One such area of inquiry is consideration of ephemeral, event-based ways rock art interplays with the surroundings—the way rock art may have been created against a backdrop of specific environmental conditions—in some cases conditions that are unique and clear, in other cases seemingly undistinguished. Discoveries may come slowly while a hypothesis is tested under various conditions. There are some obvious starting points—solstice and equinox, for example—but even then the opportunity for discovery comes but once a year. Three rock art sites on Vandenberg AFB, California, have pictographs and petroglyphs that were created in interplay with either sunrise or sunset during Winter solstice. This paper discusses the interplay at each site and the methods used to document these events.

Ryan, Ethan**[239]** *Chipping Away through Space and Time: A Macroevolutionary Approach to Household Spatial Organization*

Archaeological investigations at Housepit 54 within the Bridge River site have exposed seventeen discreet floors primarily dating to ca. 1500–1000 cal. B.P. In this poster, we draw data from a subset of the site's floors in order to address questions about the potential spatial and temporal relationships between the patterning of hearth-centered activity areas by primarily examining variability in lithic artifacts. Faunal remains and other features will also be included in analysis. Using the same methodological and theoretical approach for each floor, we examine feature form and function, lithic tool production and maintenance, animal and plant processing, taphonomic processes, and potentially, ritualistic practices in order to reconstruct the means by which the items within each activity area came to be co-associated. From these studies, we draw conclusions regarding the functional uses of these spaces on the house floor and their relationship over time. We then seek to address potential relationships between activity areas by the application of the ArcGIS spatial analysis toolbox and the examination of inter-assemblage variability. Results of this research permit us to develop a range of implications regarding household occupational history and sociality.

Ryan, Susan (Crow Canyon Archaeological Center)**[122]** *Sequencing Termination Events: Preparing Hearths for the Ritual Decommissioning of Ancestral Pueblo Pit Structures in the Northern U.S. Southwest*

With the development of a detailed contextual archaeology, we have gained the ability to identify how termination behaviors are related by subtle linkages in time and space. Individual actions that take place within the various portions of a structure are temporally distinct events, but are contextually related via ultimate decommissioning objectives. Each individual behavior qualified the meaning of those that preceded or followed it. Using multiple ancestral Pueblo sites in the Mesa Verde region dating to the Pueblo I–Pueblo III periods (A.D. 750–1280), this research examines how pithouse and kiva hearths were ritually prepared prior to the termination of the structure as a whole. Various preparatory behaviors identified include filling hearths completely with ash, placing material culture on and within hearth ash, and placing hatch covers over hearths prior to roof collapse. The

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

timing of distinct decommissioning events is an important factor in determining the duration of the termination period as well as the order and nature of decommissioning behaviors.

[102] *Predictive Modeling of Paleoindian and Archaic Sites across Florida with GIS*

Florida's terminal Pleistocene and early Holocene archaeological sites form interesting settlement patterns when projected upon various geographic representations. Probably many unknown Paleoindian and Early Archaic sites still remain hidden and unstudied, as more than half of Florida's landmass was inundated during these cultural periods. Due to constraints in visibility and access, the practical limits of traditional survey hinder progress in discovering additional sites around the state. With the advent of geographic information systems and its spatial statistics capabilities, researchers working in the area are able to utilize remote-sensing as well as other techniques to uncover new sites. In addition, predictive models can be created through the incorporation of LiDAR scans available through state databases correlated with existing spatial data. These allow for novel displays of the archaeological landscape in Florida. Conventional methods in both terrestrial and underwater excavation and mapping can now be bolstered via the aid of GIS to get a more complete picture of Paleoindian and Early Archaic settlement patterns in the coastal plains of the American Southeast.

[25] *The Political Agency of Pre-modern State Royal Women*

Royal women—queen consorts and princesses—were pawns in rulers' marriage game. But once established in their husbands' courts, they exhibited political agency through several means, e.g., spying, ruling in their husbands' or sons' stead, participating in the usurpation of the throne, etc. They were able to do so partly because of their position, which gave them access to power, and partly because of their ability to accumulate wealth, which enabled them to become patrons in their own right. This presentation defines agency in pre-modern societies and shows how royal women in eight pre-modern societies (from Old Kingdom Egypt to the Aztec Empire) exhibited similar patterns of agency.

[46] *High Energy Generation and Elevated Temperature Potential of an Archaic Furnace in Ancient Peru*

We present an aerodynamic and thermal study of the architectonic complex including a fire pit (locally named Fogon Mayor) on top of the largest pyramid in Caral, a society that flourished between 2627 and 2020 cal B.C. near the Pacific coast of present day Peru. The air flow produced by wind on the corridor and ducts feeding the fogon was estimated by various engineering approaches that agreed (within 7–18%) with calculations obtained by fluid-dynamics-modeling of the whole pyramid. Results were validated by measuring wind gradient along the pyramid in Caral and by testing a scale model of the complex in a wind tunnel. The air flow produced by wind harnessed in the corridor and ducts was in remarkable agreement with the required for complete combustion of wood loads in the fogon. Thermal analysis indicates that after reaching steady state, combustion in the fogon would have produced between 95 KW and 350 KW at an operational temperature above 1120oC and likely between 1180 and 1350oC. This temperature range was confirmed by nondestructive spectrographic analysis of ancient burn samples in the walls of the fogon. The remarkable sophistication of the complex will be discussed from an engineering perspective.

[164] *Changes in the Sources of Olivine-Tempered Ceramics and the Social Interaction Patterns among the Virgin Branch Ancestral Pueblo*

Various forms of social interactions seem to have been adopted as risk-buffering strategies in the marginal agricultural environment of the Virgin Branch Ancestral Puebloan region. The olivine-tempered ceramics are widely distributed in this region and the sources of olivine are in the highlands near Mt. Trumbull and Tuweep. Thus, the presence of olivine-tempered ceramics in the lowland Virgin area indicates economic and social ties between the highland and lowland populations. This ceramic compositional study using LA-ICP-MS suggests that the sources of the olivine-tempered ceramics found in the Mt. Trumbull and the lowland Virgin areas are not only in Mt. Trumbull but also in the lowland Virgin area, with the latter production centers having used olivine from Mt. Trumbull. The study also suggests that some of the olivine-tempered ceramics made in the lowland Virgin area were moved back to Mt. Trumbull. In this study, I explore the mechanisms of social interactions that moved olivine-tempered pots within various areas. In particular, I address the question of whether olivine-tempered ceramics were transported as a result of trading or human migration in various time periods. To answer this question, ceramic compositional data will be combined with optically stimulated luminescence (OSL) dating.

[295] *Multiple Temporalities in the Andean Eastern Piedmont (Tucumán Province, Argentina).*

New perspectives from social archaeology have recently addressed the constitution of early village landscapes in the Northwest of Argentina. These new ideas have recognized the existence of multiple temporalities rather than the unilinear historical development of cultures or settlements conceived by previous normative and processual approaches. This dissertation will discuss the relevance of multi-temporal perspectives in order to understand social and political transformations in the long term process and the reproduction of social practices in the microscale, emphasizing the role played by ancestor veneration. Furthermore, we are interested in the diversity of material features in which ancestors were represented (e.g. cist tombs, huancas or menhirs, figurines, sculptures) with the purpose of generating measurable and testable data about this kind of archaeological record.

[288] *The Materiality and Creation of Constructed Space at Etlatongo, Oaxaca, Mexico*

This paper explores the ontological relationality between humans and the creation of space during the Cruz B phase (1200/1150–850 BC) in the late Early Formative Etlatongo, in the Mixteca Alta of Oaxaca. In particular, we focus on how the use of bedrock afforded the construction of a 'lived' place. By looking at the materiality of its intrinsic properties, we argue that the Mixtecs of Etlatongo intentionally used bedrock as part of construction episodes in the formation of a public space so that its symbolic properties were able to emerge with the building's form and history. Considering that ethnographic accounts mention that Mixtecs understood reality as an indivisible whole animated with sacred life forces, we examine the ways in which this existential unity manifested during construction events and through the life histories of buildings; we link our Cruz B example with ethnographic practice through subsequent construction episodes at Etlatongo that illustrate the abiding interest in certain attributes of bedrock. Furthermore, we contemplate how the relational co-constitution of sediments, structures, and humans afforded the articulation of new relationships during the formation of Early Formative Etlatongo.

[40] *Procedural Modeling for Archaeology*

The archaeology of landscapes and cities produces large quantities of data that presents a challenge to visualization. Libraries of procedural scripts or "rules" can help to streamline the process of modeling built environments and their topographical contexts, by identifying typical elements that can be adapted to empirical data through the modification of parameters. One of the advantages of procedural modeling as opposed to other types of archaeological visualization is that it allows for the rapid prototyping of many different iterative versions of a model, thereby allowing researchers to test different theories and present many different hypotheses side by side. A second advantage is the ability to connect, line by line, the code or "rules" that generate the models with source data and process documentation. This paper presents projects that use procedural methodology for archaeological reconstruction of cities, landscapes, and individual buildings.

[70] *Archaeology and Tourism in the Early 20th Century: Pompeii through a Photographic Archive*

Since its rediscovery in 1748, Pompeii has remained a destination for travelers and tourists from around the globe. Originally, a tourist destination during the Grand Tour, mainly in the 17th-18th centuries, Pompeii attracted the educated elite. In the course of the 19th century, the site was transformed into an open-air museum and became accessible to a broader group of visitors seeking an authentic experience. This presentation offers a glimpse at a tourist's experience in the early 1900s through a private archive of 32 original photographs. This collection of images can provide significant information on the history of archaeological excavation and tourism in Pompeii at the turn of the 20th century. GIS's Network Analysis is used to create a visualization of a route throughout Pompeii based on the locations and monuments captured in the photographs. These images can be correlated with excavation histories to ascertain which unearched features were observable to visitors and those that were inaccessible—an issue that is of continuing relevance to the present day. Furthermore, souvenirs acquired during the visit suggest that tangible objects played a significant role in the quest of tourists to capture the experience and memory of the site.

[76] *Prey Choice and Politics: Modelling Postclassic Maya Wood Selection at La Punta, Chiapas, Mexico*

How did Postclassic Maya communities decide which tree species to harvest for firewood and timber in a diverse forest environment? Most studies of ancient tree selection have used the principles of optimal foraging to construct a baseline of expectations for interpreting archaeological charcoal datasets. This paper will explore the implications of such a model on the interpretation of wood charcoals from the site of La Punta in Chiapas, Mexico, while also considering how the political structure of Postclassic Maya society could have influenced the resource gathering behavior reflected in the data. La Punta is one of several contemporaneous Postclassic Maya sites located along the shores of Lake Tzibá'na in the Metzabok nature reserve in Chiapas, Mexico. In 2014, excavations in its public central plaza encountered terminal deposits of charcoal, ceramic, and animal bone. The charcoal from this communal context will be compared to charcoals found in domestic contexts elsewhere at the Metzabok sites to understand if (and how) wood selection strategies varied significantly based on context.

[9] *Geoarchaeology, Geochemical and Spatial Distributions of the Obsidian Source in Southern Mendoza (Argentina): The Case of Coche Quemado Source*

During the last twenty years, four primary obsidian sources have been recorded in southern Mendoza province. The archaeological record indicates that all were used from the Holocene until pre-hispanic times, however many obsidian artifacts still are assigned to unknown sources. Recent surveys allowed discovery a new obsidian source called Coche Quemado. It is located in the western margin of the lower basin of the Rio Grande, in the Mendoza Andean piedmont. The obsidian from the source appears as nodules of variable sizes and very good quality for the manufacture of tools. The nodules are part of a conglomerate that corresponds to the geological formation Agua de la piedra (Oligocene). In this paper, we present the spatial distribution of the source, the variety of the macroscopic characteristics of the raw material and current trends in the archaeological record. Seventeen samples were analyzed by INAA and XRF by the Archaeometry Laboratory at MURR. The results indicate that the Coche Quemado source has a different geochemical signal than all other sources in the region.

[87] *Feeding Vessels in Later European Prehistory*

Small vessels with spouts, from which liquid can be poured, are known from settlements and graves of the European Bronze and Iron Ages. Sizes, shapes and decorations are highly variable, and although they generally fit the period-specific style, they represent a functional type. One explanation for this vessel form is libation—the act of pouring a liquid as a sacrifice to a deity. Recent discoveries, however, reinforce an association with children's graves and suggest a function as feeding vessels for babies and small children. Experimental work has confirmed that it is possible to feed small children with liquid from feeding vessels. In the course of the European Research Council funded project 'The value of mothers to society,' we are currently using GC-C-IRMS to test vessel fragments for organic molecules from liquids that may be preserved in the ceramic matrix. This paper will discuss if and how feeding vessels were used for the care of babies, small children, and the sick, as well as potential health implications of using alternatives to breastfeeding in prehistoric Europe.

[171] *The Agency of Flowing Water in Human Mobility and Interaction*

Water is one of the most powerful agents of change on the planet. Flowing water can build and destroy landscapes rapidly in dramatic fashion as with flash flooding or gradually through incremental natural processes, shaping the terrain through sedimentation, erosion, and seasonal fluctuations in water flow. Within human societies, these waterways may be perceived as a source of danger, but also provide subsistence and non-subsistence resources, and serve as landscape features that alter how people move through the physical world. Though scholars widely recognize the extent to which humans have incorporated flowing water into cultural processes such as for trade, this paper focuses on the idea that waterways introduce possibilities and limitations to which communities respond. I consider several case studies in North America, with a focus on the Northeast and Mid-Atlantic regions, to show that flowing water is not a passive element of the human environment, but an active participant in the creation of physical and social worlds. Flowing water alters human mobility and resultant interaction spheres, particularly during period of significant social and economic transformation such as occurred during the early reorganization associated with early colonial presence along the Atlantic coast of North America.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Sampeck, Kathryn (Illinois State University)**[271]** *Barrios de mulatos in the Izalcos Region of Colonial Guatemala*

While much scholarship has focused on indigenous-Spanish relationships in the construction of colonial Mesoamerica, a substantial and growing part of the population of colonial settlements were people of African descent. This trend was equally true in the Izalcos region of colonial Guatemala, what is today western El Salvador. This region was a crucial center in the developing trans-colonial economy because of its early leading role in the production of cacao, the tree whose seed is the main ingredient for chocolate. Because of the extraordinary place of the Izalcos in this colonial moment, the region experienced intense social, political, and economic pressures. One expression of colonial anxiety was the development of a social classification system known as castizaje. While some casta terms are part of the sixteenth-century vocabulary, the system of castas was not systematic until the eighteenth century. Censuses and other documentary evidence indicate that discrete barrios in Izalcos region towns were mostly Afro-Central Americans. This paper presents evidence of their material worlds, including spatial arrangements and portable material culture from the sixteenth to eighteenth century, the time of the development of racial ideologies in Spanish America.

[170] *Discussant***[271]** *Chair***Sampson, Christina (University of Michigan)****[81]** *Late Pre-Columbian Craft and Community at the Weeden Island Site (8P1)*

In the past, as in the present, political-economic relationships occur at multiple social scales: for instance, we recognize regional relationships of dominance or tribute, degrees of dependence or rivalry between trading partner communities, and patterns of collaboration or competition between neighboring households. Enduring inequalities may become established at any of these levels at different times. This paper will discuss the local organization of residential communities in the context of the Safety Harbor culture, which occurred on the west-central Gulf coast of Florida in late pre-Columbian times. Early Safety Harbor culture represents a transition from Woodland-period communalism to the hierarchical systems witnessed in the early historic period, though the timing and nature of these changes remains ambiguous. The limited amount of evidence from domestic contexts has made it difficult to understand the degree to which changes in regional settlement corresponded with new ways of managing local relationships. I will focus in particular on recent work at the Weeden Island site (8P1), including evidence for an emphasis on crafting special-purpose shell ornaments and the integration of crafting activities with other aspects of subsistence.

Samson, Alice (School of Archaeology and Ancient History, University of Leicester)**[123]** *When Is Creolization?*

Multiple episodes of identity transformation can be seen in the archaeology of Mona island. From the emergence of "Taino-ness" (cf. R. Rodríguez) in the 12th century, to the catastrophic (after S. Mintz) eruption of colonial identities in the 16th century. We contrast the dynamics and character of creolizations from a diachronic and material perspective by looking at the archaeology of 500 years of subterranean ritual landscapes of Mona. We ask whether an expanded use of the term creolization is useful to challenge the rigidity of concepts such as Taino, indigenous, Spanish, Christian.

Maritime hunter-gatherers from Fuego-Patagonia are of special archaeological interest given their sudden emergence in the archaeological record and their highly specialized economic adaptation. In 2011 we carried an intense salvage archaeological excavation program along the central area of Strait of Magellan in Southernmost Patagonia, Chile. Here we present the results obtained from 1.546 m² of excavation, where a total of 18 archaeological sites, located along the eastern shore of the Brunswick Peninsula (south of Punta Arenas), were rescued. The excavations have generated an important archaeological assemblage of materials that provide significant information regarding the human occupations of this region between c. 2500 years BP and the XVIII century.

This study assesses the general characteristics of the occupations in this region, and discusses their technological components (bone and lithic instruments) and the faunal resources exploited. The results obtained are then compared with previous studies in this region. These data are used to discuss the intensity of human occupation in the area, and the role of marine and terrestrial fauna in the subsistence strategies of the maritime nomads from Southernmost Patagonia during the Late Holocene.

Sanchez Miranda, Guadalupe (Instituto de Geología-UNAM/INAH) and John Carpenter (Centro INAH Sonora)**[59]** *Pleistocene and Holocene People of Sonora*

Recent interdisciplinary investigations have revealed that the Sonoran Desert region is not only one of the earliest regions occupied by humans on the American Continent but also has one of the longest occupation records. The earliest Sonorans were proboscidean hunters in the Late Pleistocene, Archaic foragers and hunters in the Early and Middle Holocene and maize farmers in the Late Holocene. Several sites in the state of Sonora, Mexico have a well-preserved archaeological record with stratigraphic deposits that cover the last 15,000 years. Based upon multiple sources of evidence (pedological data, isotopes, pollen samples, macrobotanical remains, diatoms, and cultural material) primarily from the El Fin del Mundo and the La Playa sites; we explore the mobility, social and economic organization of the peoples of Sonora from the Pleistocene to the acquisition of maize.

[155] *A Gomphothere Kill and a Clovis Campsite: The Clovis Faunal and Lithic Assemblages from El Fin del Mundo, Sonora, Mexico*
El Fin del Mundo is a Clovis site with multiple activity areas located in the Sonoran Desert of Northwest Mexico. The site contains the only gomphothere (*Cuvieronius* sp.)-Clovis association yet known in North America and has produced one of the largest assemblages of diagnostic Clovis stone tools south of the US-Mexico border. Zooarchaeological and taphonomic analyses indicate that Locality 1 preserves the remains of two gomphotheres, aged to approximately 2 years and 8–19 years old, and that the spatial integrity of the site is well preserved. Clovis points and flakes are scattered in and around two bone concentrations, each containing the remains of a single gomphothere. Lithic materials are scattered across the stable upland surface to the south of Locality 1. The lithic assemblage from these uplands includes bifaces, unifaces, and blades. The artifact classes, tool types, and their contexts are indicative of a Clovis camp or camps where domestic tasks took place on the stable uplands surrounding the gomphothere kill.

Sanchez-Tornero, Francisco (Francisco J. Sanchez-Tornero)

[95] *The Use of White Engobe in the Formative Ceramics in Ojo de Agua Spring from San Antonio La Isla, Toluca Valley, Mexico*
In the present research analyzed by Scanning Electron Microscopy (SEM) and Energy-Dispersive X-ray (EDX) the Formative (ca. 1500BC-200BC) ceramics with white engobe, located in Ojo de Agua spring from San Antonio La Isla, Toluca Valley, with the objective of identifying the first manifestations of the use of white engobe and/or dye in a comparative framework and its cultural significance for the lacustrine societies in the studied regions. Micrometric images and chemical data identify fossil diatom structures in the engobe, indicating that it is the raw material used for the elaboration of the white engobe applied to the Formative ceramics in the Alto Lerma basin and the southern basin from Mexico. The chemical-elemental results suggest that the use of the diatom fossil as a dye material was a chromatic tradition rooted in Alto Lerma and in the south of the basin of Mexico, which prevailed in riverside communities for millennia. The similarities and specific variations, recorded in archaeometric information, allow the recognition of the relationship between different human groups, the technique and/or the techniques used, serving as a basis for knowing the cultural legacy that identifies a population group.

[249] *Travelling across the Atacama Desert: New Evidence for Human Mobility in Northern Chile Based on Oxygen and Strontium Isotopes*
The study of human mobility is key to understanding the social and cultural dynamics of the pre-Columbian groups that inhabited northern Chile's Atacama Desert. Material culture suggests that during the Late Intermediate Period (AD 900–1450) individuals frequently crossed the desert from the coast to the Andes and vice versa. Fish remains have been found in the interior valleys, and inland textiles and crops at the coast. This paper explores mobility in northern Chile through the application of strontium and oxygen isotope analyses on human teeth from several archaeological sites. First we present a local bioavailable strontium baseline for the study area, based on plant and animal remains, which helps to alleviate the scarcity of bioavailable strontium isotope data for northern Chile. Results show that non-local individuals of both sexes were buried in the dispersed cemeteries of Pica 8, Quitor 6 and Los Verdes 1. These results support the idea that varied groups of individuals moved across the landscape, complementing and augmenting the larger discussion on mobility patterns in the Atacama Desert.

Santasilia, Catharina (University of California, Riverside)

[262] *Tlatilco Revisited*

Since Tlatilco was discovered in the 1930s by Miguel Covarrubias, our understanding of the Early Formative site has changed with a steady flow over the last 80 years. During the 1940s, 50s, and 60s Tlatilco was excavated revealing the dynamic of the site, with the objective to establish the chronology and preserve the many burials. There seems to be extensive evidence that Tlatilco in fact was more than a burial site. The established (calibrated) dates for Tlatilco to be between 1200–900 BCE which makes Tlatilco contemporary with many other significant cultures in Central Mexico, including: San Lorenzo and Las Bocas. My research involves gathering iconographic and archaeological data from major collections all over the United States, as a supplement to understand the variation within the material expression of this ancient culture. Through comparative techniques, as well as utilizing advanced laboratory analysis, I am investigating the diversity of the community of Tlatilco and its neighbors. New observations and research has yielded changes to our previous understanding of Tlatilco.

[100] *Inca Imperial Colonization and Ethnicity of Northern Chile*

Were the Inca aware of the restrictive possibilities for labor and productivity in the extreme arid territories of the Atacama Desert of northern Chile? How did the Inca officials manage to obtain information that enabled them to identify (i) strategic enclaves for farming, installing administrative and political nodes, exploiting and processing ores, and (ii) a selection of conspicuous mountains to place hilltop shrines? Here we discuss the idea that the rapid, extensive, and efficient expansion of the Inca into northern Chile was not the consequence of random decisions. On the contrary, the three study cases we present, the Zapahuira, Tarapacá Viejo, and Catarpe nodes, show strategic geopolitical decision-making, by reducing conflict of interest for resources and land between foreign polities and local leaders, who were active agents in promoting and facilitating the State programs. Furthermore, by transforming the economic, political, and ideological system, the Inca integrated northern Chile into a pan-continental political and economic network, and ethnic identity through the Qhapaq Ñan, among other mechanisms.

[64] *Renovation of Temples during the Kotosh Mito Phase: 2016 Excavations at Kotosh, Huanuco, Peru*

In the 1960s, the University of Tokyo excavated the archaeological site of Kotosh (department of Huanuco, Peru) and discovered monumental constructions of a ritual character which predate the first appearance of pottery in the region. The superposition of many temples (ritual chambers) suggests that there were repeated architectural renovation events during the Late Preceramic occupation referred to as the Kotosh Mito Phase. However, the chronological position of the Kotosh Mito Phase has been uncertain because the deepest level of the mound was left unexcavated to preserve its important cultural heritage features such as the Templo de las Manos Cruzadas. Furthermore, the intensive alteration by the Early Horizon occupation made the architectural transition from the Preceramic Period to the Initial Period unclear. The authors will present new data from excavations in 2016 of the same mound, aiming to elucidate the complete process of renovation of temples during the Kotosh Mito Phase.

[122] *The As(h)endant: Cosmological Work of Material Traces of Burning in the American Southeast*

Archaeological contexts of the American Southeast are rife with ash deposits that go beyond the residues of mundane burning activities. Burials and other pits at Stallings Island have layers of wood ash sandwiched between charcoal and shell; some rockshelters of the Cumberland Plateau contain successive layers of ash, each capped with earth; freshwater shell was mixed with ash to fill a massive pit on Silver Glen Run; and in north-central Florida, a dried sink filled with peat was burned to produce an ash layer containing scores of vessels. These and other cases span millennia and vast geography, and thus do not lend themselves to generalizations about the meaning or purpose of ash as a medium of ritual practice. However, in the broader cosmological framework of the Native Southeast, ash is a substance that was brought into existence through a transformation of matter that connected the Lower and Upper Worlds. In this sense, ash was indexical of cleansing or rebirth, much as the lifting smoke of a burning fire or the rising celestial bodies of the eastern horizon. As an ascendant, ash interacted with other agents to effect change or ensure desired outcomes while offering technical options for materializing expectation.

[19] *Maíz y olmecas: una truculenta trayectoria*

Tradicionalmente en la arqueología de la costa del golfo y en específico, dentro de la zona nuclear olmeca se había propuesto que uno de los principales productos que se consumieron durante el preclásico por la sociedad olmeca fue el maíz. Aunado a esto las constantes representaciones de esta planta dentro del sistema de registro olmeca, sugerían una tendencia muy marcada y una preferencia inminente a la producción de este alimento, ya sea con fines ceremoniales o para consumo. Sin embargo, recientemente se ha observado que durante la larga trayectoria ocupacional de este grupo en la zona nuclear hay diferentes tendencias alimenticias que indican la diversificación de alimentos y la preferencia o viabilidad de algunos productos sobre otros en distintas épocas. Por lo tanto, a través de la iconografía inmersa en el arte escultórico masivo y portátil olmeca, y de los datos paleoetnobotánicos disponibles se traza la trayectoria y cambios más notorios en la dieta olmeca para lograr un acercamiento a los procesos que desembocaron en esta selección de alimentos. En este sentido, ¿Cómo, cuándo, dónde y en que nivel tuvo preferencia el consumo del maíz?.

Saunders, Cece (Historical Perspectives, Inc.)

[203] *What a Pain in the Ash....Traveling That Bumpy Road*

How did man, horse and wagon traverse the muck and marshes that so often surrounded America's earliest coastal towns? Without the benefit of iron, steel, and concrete, the 18th century road builder could span muddy stretches with a corduroy road. This road type was made by placing whole, sand-covered logs perpendicular to the direction of the road in low or swampy areas. The corduroy road was an essential technique for establishing networks between communities and critical resources. The Ash Creek Corduroy Road is a preserved archaeological site directly associated with the colonial history of Fairfield, CT. A tidal grist mill and a dam were established ca. 1750 at the mouth of Ash Creek. A corduroy road was constructed along the Creek's salt marsh to link an early town road, the mill, and the Black Rock residents. Today, an intact 53-foot section of this road is visible at low tide, resting 36" below a mat of cord grass. It survives as an evocative remnant of a colonial road system. It appears to be the oldest remaining example of a preserved wooden road in the state and is a protected Archaeological Preserve.

[119] *Life on the Margins: Eastern Oklahoma's Arkansas Drainage between 1300 and 1500 CE*

Beginning around 1100 CE, residents of the eastern Oklahoma Arkansas River drainage built mounds, shared elaborate mortuary rituals, and on some level participated in a maize-based agricultural system. These aspects of the broader Mississippian pattern were centered at Spiro Mounds. Beginning in 1300 CE, people began abandoning the mound sites on the margins of the Southern Plains. As climate conditions worsened in the fifteenth century, the residents of the Arkansas drainage adopted Plains Village strategies, including bison hunting. The emergence of this new way of life coincided with the widespread collapse of Mississippian polities in the east.

[35] *Paleoenvironmental Context of Calusa Cultural Evolution on Mound Key, Estero Bay, Southwest Florida*

The Calusa occupied Mound Key in Estero Bay, southwest Florida, from approximately AD600 to the 1700s with this location serving as a cultural and political center from ca. AD950. As a fisher-gatherer-hunter society, they heavily exploited the shellfish and finfish resources of the estuary. During this time, Estero Bay's estuarine ecology and coastal geomorphology developed in response to variable rates of sea-level rise (SLR) and climate change.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Our work integrates archaeological and geological perspectives on this intertwined history of the Calusa and their environment. Specifically, we found correlations between shifts in estuarine salinity of the bay, as it closed, and the types of shellfish exploited by its inhabitants. As salinity lowered in the bay, favoring oyster reef productivity, the Calusa shifted away from more marine-based shellfish and to more heavily exploit oyster resources for surplus production. Concomitant with these shifts were changes in site organization and layout, which included construction and alteration of new landforms and features (e.g., canals and mounds). Estuarine conditions today are comparable to those in Calusa's later history, but SLR acceleration threatens a shift back to the earlier estuarine ecology and geomorphology. Consequently, Calusa's historical ecology provides insights for future environmental management of the bay.

[23] *Beyond a Record of Environmental Change: The Influence of Variability in Peat Composition on the Archaeological Record in Viking Age Iceland*

Research suggests non-woody resources, such as peat, can serve as unique repositories of environmental change. This paper discusses how peat serves such a role, and sheds light on the how these processes affect the archaeological record, an aspect of environmental change that has been overlooked. During the colonization of Iceland in the 9th century AD, early Icelanders (Vikings) began to affect and be affected by local environments. Viking colonization led to rapid deforestation of woodland resources, resulting in soil loss and increased aeolian deposition. As wood was scarce, peat and turf were commonly used as fuel sources and construction materials in Iceland. Due to the ubiquity of these materials, changes in the quality of peat and turf potentially influenced past human behavior (i.e., fuel selection, resource management, and waste production) and the archaeological record (i.e., waste disposal, farm mound development, and landscape alteration). Using micromorphology and geochemical analyses on experimentally combusted peat from a continuous bog sequence, this research will identify compositional changes and shifts in fuel quality over time. These data will provide information on resource access, wealth distribution, site formation processes, and human-environment interactions.

Sawyer, Elizabeth (Monticello Department of Archaeology), Katelyn Coughlan (Monticello Department of Archaeology) and Crystal Ptacek (Monticello Department of Archaeology)

[241] *Identifying Source Deposits in Monticello's South Pavilion*

During the winter of 2016, archaeologists excavated the interior of Monticello's South Pavilion in advance of restoration. The South Pavilion's basement served as the original kitchen until 1808, when it was connected to the main house via the South Dependency Wing and repurposed into a wash house. In order to level the floors between the South Pavilion basement and the new, immediately adjacent wing, Thomas Jefferson's enslaved laborers used three feet of sediment to raise the basement floor. Recent excavations removed nearly a third of this fill. Preliminary analysis presented at the 2017 SHA Conference sought to establish a chronology for these South Pavilion deposits. Results also indicated a strong resemblance in both sediment and artifact composition to strata excavated in the nearby Kitchen Yard by Dr. William Kelso during the 1980s and re-analyzed in 2008. Using statistical analyses, this poster expands upon those findings to check the validity of one origin source for both the Kitchen Yard and South Pavilion deposits. Using a stratified random sample of Kitchen Yard deposits with established, pre-1809 depositional date ranges, we assess similarities in ceramic assemblages to the fill in the South Pavilion basement.

[335] *Ritual Foods Compared with Daily Diet at Tenahaha in the Cotahuasi Valley during the Andean Middle Horizon*

People in the past actively chose which foods were used in different contexts. Here we compare plant remains with human skeletal remains to understand dietary practices at Tenahaha in the Cotahuasi Valley (AD 850–1050). Tenahaha was built during the Middle Horizon as a communal space to take advantage of new social interaction spheres, stimulated in part by the Wari state. Tenahaha includes burial areas as well as food storage and preparation zones. Macrobotanical remains were found in public rather than private locations, indicating communal production of food and drink. Quinoa, tubers, and molle were ubiquitous at the site, along with maize, with chicha made of maize/molle produced and consumed there. These remains suggest a ritual or communal diet heavy in C3 foods, although taphonomy and food processing will also be considered as mediating factors. In comparison, stable isotope analysis of individuals buried at the site compare favorably to the elite inhabitants of the Wari secondary city of Conchopata, who ate a diet dominated by C4 plants (maize) and meat (maize foddered camelids). Taphonomic concerns should not be ruled out, but communal use of foods with deeper histories than maize suggests active differentiation between daily and ritual diet at Tenahaha.

Scaffidi, Beth (Arizona State University)

[335] *Violent Ritual and Inter-regional Interaction during the Early Intermediate Period and Early Middle Horizon in the Majes Valley, Arequipa, Peru*

Artifacts from yungas and coastal zones of Arequipa, Peru show varying degrees of integration into the ideological and material networks of prominent neighboring cultures of the Early Intermediate Period (Nasca) and Middle Horizon (Wari). Ongoing research suggests these communities and towns were well-integrated into foreign trading networks, whether through direct interaction with foreign traders or down-the-line exchange. While foreign-produced goods and emulation of foreign goods or architectural canons can provide circumstantial evidence of inter-regional connectivity, isotopic analysis of human skeletons can offer concrete evidence that non-locals visited, resided in, or were buried in a community. This research synthesizes results of isotopic analysis of human skeletons from the cemetery of Uraca, in the Majes Valley, and describes the artifact assemblage recovered. The data presented will demonstrate that the individuals interred at the site were linked to material and ideological traditions of Nasca and other desert and coastal valleys through mortuary practices and violent trophy-head taking, while there is only limited evidence that they emulated Wari material culture or tapped into Middle Horizon trade networks. The results suggest that Uraca's interaction with foreigners was ideologically linked to rituals of violence and death, rather than materially linked to economic and subsistence practices.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Scarborough, Vernon (University of Cincinnati) and Christian Isendahl (University of Gothenburg)**[213]** *The Early Role of Biogeography in the Creation of Modern Ecology Assessments*

The landscapes and natural environments within the tropics and their wet-dry forests were the seat for understanding modern ecological principles. Initiated by Alexander von Humboldt and fundamentally altered theoretically by Charles Darwin, contemporary views of the couple human-nature dynamic were "discovered" in the New World first. Unlike the prominent worldview identifiable in the Near East and subsequently in early colonizing Europe in which "man must have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moves upon the earth" (Genesis 1:28), Central and South America settings show the inextricable affinity between humanity and the slowly modified biogeography. Clearly denudation did occur, but it was never on the scale practiced in the West. Technological thresholds and breakthroughs seldom accelerated through time; and the role of labor in an environment without widespread domesticated animals and zoonotic diseases made for a different ecological emphasis and a worldview that cultivated the role of plants, animals and their interplay. The domestication process was markedly different than in the Old World, one that less honored and preserved the greater environs.

Scarborough, Vernon [76] see Lentz, David L.

Scarry, C. Margaret (Univ. of North Carolina-Chapel Hill) and W. Flint Dibble (Wiener Lab, American School of Classical Studies a)**[298]** *Bridging the Divides at Azoria: Environmental Archaeology at an Archaic Greek City*

Excavations at the Archaic (7th-6th centuries B.C.) city of Azoria on Crete demonstrate the value of intensive environmental archaeology for understanding an historical Greek context. Texts document the important role of food and dining to ancient religion and politics; however, ancient authors presented a normative picture and excluded details they assumed were common knowledge. Studying plant and animal remains can "ground-truth" ancient sources on foodways and provide contextual nuances not afforded to historians.

The prevalence of a few domesticates presents difficulties in fields largely based on discussions of taxonomic variability, especially when trying to bridge the divide between archaeobotanical and zooarchaeological assemblages. While it is difficult to relate the numerous goats to the abundant olives at Azoria, our interdisciplinary study presents the opportunity to examine varied contexts. Deposition of plant remains happens largely before the meal is served while animals are largely deposited after dinner. Our analyses reveal that conspicuous storage and communal dining formed the backbone of the political structure at Azoria. The specific foodstuffs stored and consumed in civic buildings were much the same as those consumed in townhouses. However, the quantity and elaboration of foodstuffs within communal dining structures created a convivial community at Azoria.

Schaafsma, Polly (Research Associate, MIAC\LOA)**[131]** *Proposed Historical Origins of the Tablita Dance of the Rio Grande Pueblos*

The Tablita Dance, commonly known as the Corn Dance, is a well-known event among the Rio Grande Pueblos where, in connection with saint's days, it is performed during the growing season. The corn dance may occur at other times as well, but without a linkage to the village patron saint. A number of diverse factors, however, indicate that this dance as known today is a post-Hispanic aspect of Pueblo ceremonialism. In addition to the dance's obvious link to the Catholic patron saint of each Pueblo, is the bannered standard of proposed native Mexican origin, and finally the absence in prehispanic Pueblo art for the distinctive iconography of this dance. In this paper I explore this proposal with the supporting evidence from Aztec codices, Spanish documents, and prehispanic Pueblo rock art and kiva murals to suggest that in origin, this ritual occasion is more complex than a simple synthesis of homage to a patron saint tacked on to a preexisting ancient indigenous ceremony.

Schaan, Denise [116] see Maezumi, S.

Schach, Emily (Arizona State University) and Jane E. Buikstra (Arizona State University)**[66]** *Gender at Chiribaya Alta: A Multiple Correspondence Analysis of Funerary Offerings*

Chiribaya Alta is a Late Intermediate Period cemetery site located in the Osmore drainage of Southern Peru and is the largest, most elaborate site associated with the Chiribaya polity. Previous univariate mortuary analyses at Chiribaya Alta have identified gendered grave goods, related to roles during life. These analyses, however, assume a binary distinction between males and females by only testing graves with sexed skeletons. Here, we use a multivariate technique, multiple correspondence analysis, to analyze the graves at Chiribaya Alta. Sex is not included in this analysis and thus, the MCA groups graves without assuming a binary construction of sex. Instead, sex information is only used in the interpretation phase of the analysis. Our MCA confirms that Chiribaya graves are differentiated by gender based on funerary objects but shows greater variation in the graves of females in comparison to males, suggesting that women's gendered activities were more variable than those of men. Furthermore, the overlap in the graves of males and females suggests that these gender categories are not binary opposites, and thus we suggest an alternative system for conceptualizing gender identity in the Chiribaya polity.

Schachner, Gregson [218] see Duff, Andrew

Schaefer, Benjamin (Department of Anthropology, Georgia State University), Sloan Williams (Department of Anthropology, University of Illinois) and Nicola Sharratt (Department of Anthropology, Georgia State University)**[270]** *Constructing a Colony: Investigating Stress from Endogenous Cortisol in Archaeological Hair from a Lupaqa Colony at Estuquiña*

Using enzyme-linked immunosorbent assay (ELISA) to obtain segmented cortisol levels, these cortisol levels can reconstruct periods of heightened month-to-month duress leading up to death. Segmented cortisol levels provide a more nuanced understanding of stress variation through biocultural change and lived experiences in antiquity. This study aims to reconstruct periods of duress through assaying endogenous cortisol in archaeological hair (n=11) from the site of Estuquiña and investigate the effects of a mitmaquna development. The site is located outside the modern city of Moquegua in the Moquegua Valley of southern Peru and was likely established as a Lupaqa colony settlement during the Late Intermediate Period (AD 1100–1476); a period characterized by regional development and political transition throughout much of Andean South America. Preliminary results suggest that there is a difference in cortisol levels in juveniles (18–64±19 ng/g) compared to adults (150–248±68 ng/g) and clinical data (104–134±40 ng/g). This exploratory research suggests that the variation in cortisol levels at Estuquiña differs based on sex and pre- and post- pubertal development at time of death.

Schaefer, Jonathan (University of Missouri) and Leslie Aragon**[91]** *Regional Influences on Cliff Phase Ground Stone in the Upper Gila Area*

Ground stone tools are a productive means of studying subsistence and technology practices in the American Southwest. Excavations at the Gila River Farm Site and other nearby settlements have provided a large collection of ground stone objects used for various tasks. Here, we evaluate the use of the tools from these sites and compare their morphology to tools recovered elsewhere in the Kayenta and Mogollon areas. Regional and temporal variations in ground stone characteristics provide insights into how earlier archaeological traditions influenced ground stone tool morphology in the Cliff phase in southwest New Mexico.

Schaefer, Richard (Historical Perspectives, Inc.)

[203] *"His Beloved Aunt Polly": The Aunt Polly Archaeological Preserve and the Life of the First Sherlock Holmes*

The most renowned stage portrayal of Sherlock Holmes, it was William Gillette who brought Conan Doyle's detective to life for audiences as well as for every actor that followed in his footsteps. Most importantly, he originated the Holmes "look": the deerstalker hat, the curved pipe, and the Inverness cape. In his day, Gillette was the wealthiest actor in the country. He spared no expense in building his eccentric stone "Castle," perched high above the Connecticut River, and in the creation his beloved Aunt Polly, a naphtha-powered yacht he commissioned in 1899. Moored at the riverbank beneath the Castle, Aunt Polly burned to the waterline in 1932 under mysterious circumstances. Research and underwater archaeology on the Aunt Polly and her remains are now being incorporated into the Gillette Castle's museum and waterfront park.

[337b] *Mitochondrial DNA Results from the Kormantse Archaeological Research Project*

Kormantse is an influential and celebrated place name in the African Diaspora. Some scholars estimate that more slaves were transported from Kormantse and nearby Fort William in Anamabo than most other West African ports. For the last ten years, the Kormantse Archaeological Research Project (KARP) has been studying the human skeletal remains recovered from the site. A combination of PCR-based techniques, targeted enrichment, and next-generation sequencing of Kormantse teeth has confirmed endogenous DNA that is associated with common African haplogroups. While it is expected that little DNA will survive in the tropical and subtropical latitudes of Africa, this study demonstrates that small amounts of aDNA—in some cases informative of mtDNA haplotype—can survive extensive tropical environs and humidity as well as aggressive seasonal turnover provided that the remains are from recent excavations, and are controlled for DNA contamination during and after the field season. These haplogroups are discussed within the context of the African Diaspora and its occurrence in areas of the Americas, particularly the Caribbean, circum-Caribbean and South America.

[35] *Vegetation Change at Poverty Point, Louisiana*

This paper presents pollen data as a proxy of past vegetation at Poverty Point, a large Archaic mound site in northeast Louisiana. The paleoecological focus of this presentation revolves around the rate and nature of change over time. Patterns and changes in taxonomic diversity are presented and discussed in light of environmental productivity. The rate of vegetation change is calculated and related to ecosystem stability. Additionally, changes in individual taxonomic representation are examined to determine if change over time occurs piecemeal or to entire plant communities. Such findings will be related to the impact of vegetation change on people and the role of anthropogenic change in shaping the local environment.

[29] *Explaining Variation in the Scale of Neolithic Quarry and Mine Production*

In recent years new methods have been developed for using summed radiocarbon probabilities as a population proxy and for comparing radiocarbon datasets to establish whether they are significantly different from one another, while taking into account sampling variation and the patterns in the calibration curve. On the basis of newly collected and updated radiocarbon data on the dating of Neolithic mines and quarries in Britain, Ireland and continental Northwest Europe, the paper will present the results of using these methods to compare the chronological distribution of mine and quarry exploitation with regional fluctuations in the population of early farmers and in the scale of forest clearance that they undertook, to test the hypothesis that the intensity of production depended on variation in the demand generated by the population and its clearance activities. It will do this by simulating large numbers of mine date samples on the assumption that they represent random samples of the population and clearance distribution and comparing these with the observed distribution.

[101] *A Picture Is Worth a Thousand Words: Reading the Past and (Digital) Interpretation in the 21st Century, a Case Study from the Bighorn Basin, Wyoming*

During 2016 and 2017, Bighorn Archaeology participants used on-the-ground photogrammetric methods and aerial photography to document features at archaeological sites throughout the Bighorn Basin and surrounding foothills in northwestern Wyoming. The sample includes both horizontal and vertical features such as stone circles (tipi rings), a hunting driveline, defensive rock bulwarks, and pictograph rock shelter overhang panels. In this presentation, we discuss our evolving methodology and the resulting three-dimensional models and orthomosaics, along with implications for future uses of these techniques. The applied methodology highlights the potential of this emerging technology to rapidly document and assess site features when on-site time is limited. We also discuss issues related to processing, affected by proprietary software availability and computer memory capacity, especially for building models while in the field. High-precision technology applied to document surface architecture and fragile rock art on the mountains and plains of western North America in the last decade has focused on establishing regularized patterns of domestic life and distributions of resources across the broader social landscape. Layering in three-dimensional models produced using hundreds of photographs from a DSLR camera further directs these efforts and re-defines expectations for archaeological interpretations, especially in cultural heritage and preservation dialogues.

[216] *Seeing Gender Ambiguity in Moche Visual Culture*

This paper explores the visual language of gender expression in Moche art, seeking to determine the relationships among ambiguous gender, social role, and status in Moche visual culture. The Moche are well-known for their representations of warriors and warfare, as well as the sacrificial rituals associated with the taking of prisoners. However, this martial focus was not consistent across Moche time and space, and regional variations indicate the existence of a potential field of expression which was used differently in different areas and times. In this paper, I explore that potential field of expression, and the representations of gender that could exist outside of the strongly-gendered warriors and priests. I focus instead on the center of a Moche spectrum of gender that had women at one end and men on the other. Clothing could cover areas of the body associated with gender identity, and diagnostic elements such as hairstyle could be covered or simply not expressed. In addition, contextual elements such as ornaments and adornments, items held in the hand, or settings can give clues to social roles and status relative to the warriors and priests, and form a greater understanding of how the iconography deals with gender.

Scherer, Andrew (Brown University)

[163] *Recent Investigations of War, Economy, and Population at Piedras Negras, Guatemala*

This paper presents a synthesis of current results from the 2016–2017 research seasons at Piedras Negras, Guatemala with implications for understanding warfare, economy, politics, and population dynamics throughout the ancient kingdom. First, while project members had identified a series of fortified centers and palisades in the region's hinterlands, the recent identification of fortifications in the near periphery of Piedras Negras makes it one of the rare polity capitals in the southern Maya lowlands where such features have been reported. Second, while regional research had revealed evidence for craft production and exchange, prior evidence for craft production at Piedras Negras was relatively scant. Recent excavations have significantly altered this perspective and changed our understandings of economic integration at the capital and across the kingdom. Third, prior subsistence and diet research largely focused on soils and bone isotopes, while the present project adds the complexity of research into plant economies. Further, project participants have begun to draw together the disparate threads of settlement research to produce a more integrative picture of settlement dynamics. Finally, a return to Piedras Negras has also afforded the opportunity to further conserve the site and engage with local stakeholders for long-term protection.

[138] *Stored and Forgotten: Academic Research Projects Using Archaeological Collections*

Around the world, there are a large number of archaeological collections in the repositories of museums, universities, foundations, government agencies and other organizations. The curation crisis has generated a great deal of debate as to how we can help to ameliorate the various problems faced in collections management. This paper will present a proposal of how collections can be used to develop academic projects, both in local repositories and those outside the country, by outlining case studies that can serve as a template for research design. Finally, it will be demonstrated that the collaboration between personnel from the repositories and universities is the ideal alliance to encourage students to revisit archaeological collections for their research projects.

[178] *The Capac ñan from Chachapoyas to the Tierra adentro*

The capac ñan from Chachapoyas to Moyobamba was used for centuries before another road was built for driving traffic and latest with the Marginal further on to Tarapoto. The capac ñan was used by the Incas in their conquest of Moyobamba and later to be used by the many Spanish campaigns in their search for Eldorado. This important highland/lowland route crossing the cordillera and continuing into the Ceja de Selva gave access to coveted resources from both sides but also facilitated war parties to attack the highlanders. During our investigations in recent years, we have located the ancient trail which was stone paved for long stretches and found documents in the archives showing the existence of hitherto unknown tribes that lived along the river systems up to the end of the 17th century.

Schlegel, Trinity

[338] *Prioritizing Title IX in Private Cultural Resource Management*

Cultural Resource Management (CRM) employs approximately 63% of archaeologists in the United States. Private consulting firms contract with federal agencies to assist in compliance with federal laws such as NHPA, NAGPRA, ARPA and AHPA, and additional state laws. As contract archaeologists, we often work extended periods within small groups in isolated areas, which lends to work environments away from support systems of family and friends. Co-workers depend on each other for safety and support in more intimate environments than non-field work. This intimate nature of our work environment often permits lines between professional/formal relationships and personal relationships to blur. Consequently, individual behaviors, intentional or not, can result in uncomfortable and/or un-safe work environments. Field conditions can provide a context in which civil rights and Title IX can inadvertently be lost. In addition, the small, isolated nature of the group can act as a deterrent to speaking out against harassment or discrimination. I argue that CRM firms need to prioritize Title IX to the same degree as other federal laws that govern our work. To redefine the existing culture of our field, individuals at all levels must participate in the discussions and creation of a safe, healthy and respectful work environment.

[95] *Pottery Production at the Dillard Site: An Early Basketmaker III Community Center in the Central Mesa Verde Region*

The Dillard site (5MT10647)-the earliest community center identified in the Mesa Verde region-may contain among the oldest examples of multi-household pottery production during the Basketmaker III period. A thorough understanding of how pottery was produced and obtained at this early large pithouse village, which is centered on a great kiva, provides important insights on village organization and interpersonal relationships. In this poster, we explore compositional variation in pottery production using three data sets to evaluate variation in materials used in pottery production: binocular and petrographic qualitative analyses of temper, refiring, and neutron activation analysis of paste. These lines of evidence allow us to identify spatial patterns in the distribution of pottery and its potential compositional differences among the pithouses at the Dillard site in order to address the organization of production, as well as the extent of influence the Dillard site may have had on the broader surrounding community through pottery production and exchange. Methodologically, we also compare the correspondence of compositional groups to refire color groups in order to determine the potential use of the refiring technique as an inexpensive compositional method for future projects in the area.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Schmader, Matthew (University of New Mexico)

[27] *Evolutionary Change in Household Architecture, Settlement Patterns, and Subsistence Technology: A 4000 Year-Long Record from the Middle Rio Grande Valley, New Mexico*

Evolution in domestic architecture, settlement patterns, and subsistence technology can be revealed by long-term stability followed by rapid change. Research in the middle Rio Grande valley of New Mexico documents a 4,000-year long record from 3000 BC to AD 900. Archaic period structures, dated 3000 BC to about AD 250, display little change in form, size, and construction details. Settlement pattern changes appear with the first midden deposits and increased numbers of dwellings with associated storage features. Constructed milling features for processing wild seed appear before the adoption of cultigens.

Long-term architectural and technological stability gave way to rapid change coinciding with the appearance of agricultural domesticates after AD 500. Multi-dwelling sites and architectural investments indicate decreased residential mobility. Simultaneously, distinctions in functionally specific domestic spaces appear with the separation of cooking areas from sleeping spaces. Sweeping changes occur in subsistence technology: groundstone reflects the shift from a seed-based diet to a corn-based diet. Cooking features changed from rock-lined pits to formalized hearths. Domesticated corn required ceramics for cooking; size, shape, and location of storage features also changed rapidly. Implications for cultural continuity and in-place population growth are discussed in light of these long-term trends.

[203] *Canning and Preserving History at The Borden's Condensed Milk Factory Site in Torrington, CT*

Gail Borden was a man of persistence and a creative inventor. Were it not for his inquisitiveness and drive in the wake of numerous failures, canned milk and Elsie the cow would never have become irrevocably connected in the minds of millions. Failing to make functional his terraqueous prairie-schooner or to make his desiccated meat-bread palatable, he pursued methods of condensing and preserving milk in sealed containers at several locations in Connecticut. Before his success, bacterial infested milk caused a dreaded, and sometimes lethal, illness. His meticulous attention to cleanliness and adoption of a vacuum pan for condensing milk that the Shakers used for condensing juice was a recipe for success. His preserving and canning process allowed protein-rich sanitary milk to reach those who could not reach for the cow. His successes proved vital to the military and long-distance travelers alike. The Borden's Condensed Milk Factory Site in Torrington Connecticut was one of his earliest condensing factories, relying on the waters cascading down from Burr Mountain Pond to power the process—the same waters that eventually carried much of his factory building away. The factory site and its remains are now, befittingly, a Connecticut State Archaeological Preserve.

Schnell, Joshua (Brown University), Sarah Newman (James Madison University) and Andrew Scherer (Brown University)

[163] *Animal, Human, and Crafted Bone from the S-Sector of Piedras Negras*

Excavations within the S-Sector at Piedras Negras in 2016 yielded an assemblage of lithic and bone artifacts consistent with evidence of craft production. The Proyecto Paisaje Piedras Negras—Yaxchilan returned to the S-Sector during the 2017 field season to conduct more extensive excavations in an attempt to understand production and exchange at this Maya polity capital. Between the 2016 and 2017 seasons, over 4,300 fragments of worked and unworked bone, both human and animal, were excavated from the S-Sector. Here we present the preliminary results of an integrated bioarchaeological and zooarchaeological analysis of the materials. The significance of this assemblage lies in its composition, consisting of both human and animal bone, including finished tools, ornaments, and production debris. Especially notable are large quantities of bone objects used in the working of textiles. Among the human remains are a sizeable quantity of isolated, pathological teeth that we believe may be the remains of tooth extractions.

Schollmeyer, Karen (Archaeology Southwest)

[91] *Strange Birds: Avian Remains in the Upper Gila and Mimbres Drainages*

Bird remains are seldom abundant in archaeological assemblages in the Mimbres region of southwest New Mexico. Despite their relatively low frequency, many of the occurrences of bird remains in this area are derived from interesting or unusual archaeological contexts, and provide a wealth of information on cultural practices and local and regional environmental conditions. This study examines data from over 70 archaeological assemblages from the upper Gila area and elsewhere in the Mimbres region, presenting regional and drainage-level patterns in the abundance of different bird taxa as well as temporal changes visible over the period from AD 200–1450. It also highlights recurring associations of particular taxa with specific archaeological contexts, including room closure deposits.

[305] *The Archaeology of Baseball: Excavations at Warren Ballpark in Bisbee, AZ*

Warren Ballpark is considered the oldest continuously operating baseball field in the United States. The list of athletes who played at the park throughout its history includes Connie Mack (Major League Baseball's winningest manager), Jim Thorpe (arguably the greatest athlete of the twentieth century), and Earl Wilson (the first African-American pitcher for the Boston Red Sox). Despite this history of competition, very little is known about the spectators who visited Warren Ballpark. The excavation, the first ever of a baseball field, explores areas underneath the grandstands where fans congregated. Early results consist primarily of bottle fragments. We have identified soft drink bottles from the 1920's-1940s including Orange Crush, Coca Cola, and Pepsi as well as beer and liquor bottles from the 1940s-1950s. Spatial patterns also emerged with soft drinks dominant in the infield and alcohol more prevalent in the outfield. In addition to revealing beverage consumption patterns, bottle remains have yielded data concerning Bisbee's economy as we have identified bottles made in local bottling plants, as well as those imported to Bisbee by rail from points east. Such micro-historical data provide valuable insights into the lives of people who lived in this remote mining town during the early twentieth century.

Schott, Amy (University of Arizona, Petrified Forest National Park)

[221] *Soil Quality and Agricultural Productivity of Eolian Landscapes in Petrified Forest National Park*

The Petrified Forest National Park in northeastern Arizona contains extensive sand sheets and dunes. Archaeologists have long recognized the importance of the eolian landscape for prehistoric agriculture. Archaeological sites dating from c. 200–1400 A.D. correlate with eolian landscape features, which suggests that eolian soils were used for dry-farmed dune agriculture. Eolian soils are not always conducive to dry-farmed agriculture;

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

however, dune farming is known ethnographically, and has been inferred in archaeological contexts on the southern Colorado Plateau. Previous work by the author has demonstrated that eolian soils in the Petrified Forest National Park are high in clay, which may have increased the water holding capacity of the soils, improving their suitability for farming. This study uses soil chemistry to further test the suitability of eolian sediments for prehistoric cultivation in the region. Soil chemical and physical analyses include soil nitrogen, phosphorus, phosphate, organic matter, calcium carbonate, and bulk density. These are used to document the relative quality of eolian soils in the study region for prehistoric agriculture. In addition, soil geomorphic studies demonstrate the geologic conditions that made agriculture possible, and perhaps even productive, in a marginal landscape.

Schreiner, Nina

[39] *Archaeology of a Frontier Plantation: Collections Analysis at Woodville Plantation, Pennsylvania, c. 1780*

Woodville Plantation, also known as the Neville House, is an important archaeological resource just outside Pittsburgh, Pennsylvania. The mansion was constructed c. 1780 by the family of Virginian General John Neville—of the Seven Years War, Revolutionary War, Whiskey Rebellion, and early state and local governments—and was occupied by their descendants until 1973. This unique record of ownership resulted in a relatively undisturbed site delivered into the hands of a private preservation organization. Recent architectural renovation projects have unearthed an extensive collection of artifacts dating to the entire period of European occupation and an earlier Monongahela Indian hamlet. This report introduces the curated collection, which will be available for the first time for professional research. It also illustrates challenges in the analysis and preservation of diverse archaeological collections at privately owned institutions with limited space and financial resources, highlighting public engagement through archaeological education programs.

Schrire, Carmel

[308] *Social Life and Social Death among Cape Slaves*

A central imperative in historical archaeology is to produce original information and insights that cannot be derived from historical records. Sophisticated analyses of slave burials that combine the physical elements of burial grounds, coffins, and grave goods, with the biology and chemical signatures of the human remains, can identify and source first-generation slaves, and help to infer the social bonds reflected in their burial. Orlando Patterson has defined slavery as “social death” to reflect the nature and impact of forced translocation and cultural depletion. Unassailable as this might seem at first glance, recent work in underclass burial grounds at the Cape and elsewhere, challenge this deathly pronouncement by suggesting that slaves from a multiplicity of foreign homelands were incorporated into a vibrant community of free and unfree people and who nurtured them beyond their short life into the long comfort of death. This finding casts a new light on the historical records to reveal the permeable nature of slave society in the wider colonial world.

Schroder, Whittaker (University of Pennsylvania) and Socorro Jimenez Alvarez (Universidad Autonoma de Yucatan, Merida)

[163] *The Kingdom of Piedras Negras: A View from Mexico*

Though today the Usumacinta River marks part of the boundary of Mexico and Guatemala, during the Classic period the Usumacinta would have passed through numerous kingdoms, including Piedras Negras and Yaxchilan. Alternate travel routes through the valleys to the west in Mexico crossed an even more complicated political landscape approaching the kingdoms of Palenque, Tonina, and Sak Tz'i', as well as the plentiful minor centers and rural settlements throughout the region. While surveys between Piedras Negras and Yaxchilan in Guatemala have identified a definite border between the two kingdoms, research in Mexico has demonstrated a complex frontier that changed throughout the Late Classic period. Still, many of the sites identified by the Proyecto Arqueológico Busiljá-Chocoljá and others known from epigraphy can safely be associated with Piedras Negras at least for part of the Late Classic period, either based on proximity or emic accounts from inscriptions. Where carved monuments are absent, we must rely on archaeological evidence, primarily from ceramics and architecture, to understand this frontier zone of the kingdom of Piedras Negras. In this paper, we present survey and excavation data from this study region to reconstruct a perspective of Piedras Negras from adjacent areas across the Usumacinta in Mexico.

[90] *Historical and Archaeological Contexts for Zooarchaeological Analyses at Brimstone Hill Fortress, St. Kitts, West Indies*

Research at Brimstone Hill Fortress (1690 to 1854) focuses on comparative studies of the eighteenth century lifeways of British soldiers and enslaved Africans. The St. Kitts colonial government and British Royal Engineers designed the fort, and enslaved and free Africans constructed and maintained it. Excavations in areas occupied by British Army officers, enlisted soldiers, and enslaved Africans have produced substantial faunal remains. Especially revealing is the use of imported and local fishes, contrasts in the consumption of fresh and barreled meat, and evidence for the manufacture of bone buttons. Production of these data is attributable to the dogged determination of Walter Klippel and his students.

[6] *Analysis of the Lithic Assemblage from Canchas Uckro (1100–800 BC), Eastern Ancash, Peru*

Canchas Uckro is a large platform situated above the Puccha River, and approximately 25 km to the north of Chavín de Huántar. Recent excavations recovered a lithic assemblage consisting of 245 artifacts from stratigraphic layers dating between ca. 1100 and 800 BC. This poster describes the analysis of this lithic assemblage, including raw materials utilized, technological organization, and patterns of tool design in relation to possible subsistence activities. Expedient flakes from locally available sandstone and limestone comprise the majority of tool types, although finely made chipped quartz and ground slate points, as well as more formal tools like notches, drills, and scrapers, comprise over 5% of the assemblage. In addition, we discuss how the composition and organization of the assemblage complements the zooarchaeological analysis of faunal remains recovered from Canchas Uckro. We argue that the patterns within the Canchas Uckro lithic assemblage indicate a subsistence and processing strategy that largely centers on the exploitation of wild game. Finally, we consider the implications of these patterns for understanding the late Initial Period in highland Peru.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Schubert, Ashley (University of Michigan) and Maureen Meyers (University of Mississippi)**[255]** *Recognizing Variation in Pisgah Identity across Space and Time*

The late Mississippian Pisgah culture, dating from 1200- 1500 CE, is found across a wide geographic area including western North Carolina, eastern Tennessee, and southwestern Virginia. Pisgah sherds are often recognized by the presence of distinct rectilinear and later curvilinear stamped decoration with sand, grit, and/or mica temper. Excavations by Dickens (1976), Keel (1976), and Moore (1981; 2002) better defined changes over time in Pisgah ceramics while simultaneously showing the variation in Pisgah-associated features, households and settlements. This paper will examine Pisgah ceramics from two sites, Cane River in western North Carolina and Carter Robinson in southwestern Virginia, using an attribute analysis approach and taking into account the artifact, features, and household contexts in which these sherds are found. In addition, comparative data from other Pisgah collections in Virginia, Tennessee, and North Carolina will be used to better understand Pisgah identity.

Schulenburg, Marcus (University of Wisconsin-Milwaukee)**[26]** *Building Village Communities: Early Fort Ancient Villages in the Ohio Valley*

The Fort Ancient Period (AD 1000–1700) saw the introduction of formal villages to the peoples of the Middle Ohio Valley. To help understand the transition to full time sedentary villages, this paper explores how these new villages operated as communities. This allows for an examination of the relationship between communities and villages as concepts and as organizational units. This paper uses the Guard Village site (12D29), an Early Fort Ancient village, as a case study to examine this new form of community organization. Lines of evidence will be drawn from village architecture, such as site layout and construction techniques as well as the ceramic assemblage including production communities. These data will be used to attempt to identify the social processes, interactions, and mechanisms that were utilized to integrate larger populations into villages, and how people adapted to this new social unit.

Schulting, Rick, Petrus le Roux (Dept. of Geological Sciences, University of Cape T), Yee Min Gan (School of Archaeology, University of Oxford), Gary Lock (School of Archaeology, University of Oxford) and Chris Gosden (School of Archaeology, University of Oxford)**[29]** *The Ups & Downs of Iron Age Animal Management on the Oxfordshire Ridgeway, Southern England*

As in any mixed farming system, the management of animals doubtless played an important part in Iron Age societies in southern Britain. Economically, they furnished meat, milk, wool and manure, and served as draught animals for transport and tillage. Intersecting with their economic uses, they were also important socially, politically and ritually. It is relatively straightforward to determine the proportional representation and mortality profiles of the major species—cattle, sheep/goat and pig. While this provides insights into how and why animals were managed, it does not allow the detailed investigation of how individual animals were actually kept, how they were moved around the landscape, and how various nearby communities integrated their animal management practices. Isotopic approaches can offer insights into just these practices. We report the results of a multi-isotope study Early/Middle Iron Age domestic fauna (cattle, sheep/goat and pig) within a very constrained study area of the Oxfordshire Ridgeway, south-central England. Strontium isotope measurements on dental enamel provide evidence primarily for the mobility of cattle, while bone collagen stable nitrogen isotopes suggest separate herds and flocks. The results indicate that Early/Middle Iron Age stock-keeping on the Ridgeway and in the Vale was complex, and both integrated and distinct.

Schulz, Margaret (Colorado State University) and Laurie Rush (DoD-Army, Fort Drum, NY)**[332]** *Staying Relevant: Turning Your Sites from Blights to Rights*

One of the hazards of doing archaeology on federal land is being viewed as a roadblock to training, construction and other undertakings. The normal treatment for National Register eligible sites once they are found is to set them aside as off limits to training and other activities. Naturally, this is not popular with those providing funding to keep training lands open and sustainable. The Fort Drum Cultural Resources Program has developed unique methods for protecting sites while allowing them to be used as training assets. In collaboration with Civil Affairs Operations, they have provided site data in the form of no-strike lists to military trainers, allowing sites to be put into play during several large-scale training events. Program staff also served as role-players, representing host nation officials and indigenous peoples in a training scenario. Not only did this approach enrich the training opportunity, designation of off limits areas as sacred properties where incursion would result in violent retribution or command consequences resulted in the best site protection and avoidance in the history of these exercises. As a bonus for the program, it also served the purpose of keeping cultural resources and heritage relevant in an ever-changing political and social environment.

Schulze, Jurgen (UCSD), Connor Smith (UCSD), Philip Weber (UCSD), Thomas DeFanti (UCSD) and Thomas E. Levy (UCSD)**[172]** *3D Cyber-Archaeology Dissemination through Scientific Visualization—Personal and Large-Scale Virtual Reality Platforms*

We created a walk-up virtual reality system consisting of six large 3D TV displays with 4k resolution, for easy dissemination of spatial and three-dimensional archaeological findings. We call this system the CAVE Kiosk. The system has been placed in the campus library to make it easily accessible to the entire campus community. We currently support three types of data: regular photographs, high resolution panoramic stereo photographs, point clouds such as from LIDAR scanners, and 3D models such as those created by 3D scanners. The user will see all available sites with data on a 3D world map, displayed as a globe. When the user clicks on a site, the available data sets will be listed and the user can choose what to see. The data is hosted by a remote server and is downloaded on demand, with a caching system for faster access. We deployed three more, similar, viewing stations on other campuses of the University of California system. They all connect to the same server, and collaborators at those campuses can upload their data to the shared server via our custom software tool called CAVE Base.

[126] *Biomolecular and Micromorphological Analysis of Suspected Fecal Deposits at Neolithic Aşıklı Höyük, Turkey*

Suspected fecal matter from the Aceramic Neolithic site of Aşıklı Höyük was analyzed using biomolecular and micromorphological approaches to study behavioral and environmental processes. Aşıklı Höyük provides the earliest evidence for sedentism and domestication in Central Anatolia. The main goal of this study is to identify the origin of suspected fecal deposits to gain a better understanding of the use of space and waste management strategies in this early Neolithic settlement. Suspected fecal materials from middens, open-space deposits and building fills were analyzed using GC-MS to distinguish between fecal and non-fecal sources. Steroid biomarkers were used to differentiate between human and faunal excrements. Preliminary results from biomolecular analysis show that not all suspected fecal materials are actually of fecal origin and may instead be secondary phosphates. Suspected coprolites collected from a building fill could be confirmed to be of ruminant origin suggesting that animals were kept inside the settlement. This finding is supported by the identification of intact dung deposits in thin sections from middens and open-space areas. Coprolitic materials identified in dumped refuse deposits in thin sections yield biomarkers that suggest that omnivore (potentially human) fecal material was disposed together with domestic waste in designated areas within the settlement.

Schumann, Rebecca (University of Illinois)

[42] *The History We Remember: Race, Law, and Understanding the Archaeological Landscape*

Law works in ways to promote specific interests of those with power, often leading to racial and economic marginalization. Through an examination of 18th and early 19th century Virginia laws, I investigate the relationship between law and race. I explore how laws help shape racial categories and forms of structural racism, and promotes economic inequality. These historical economic and racial inequalities impact how we understand archaeological landscapes and whether sites meet the criteria for the National Register of Historic Places. As a result, past forms of structural racism continue to affect our present day understanding and treatment of historical people in the present, engendering historical silences. Using archaeological sites from George Washington's Mount Vernon, I examine how laws governing archaeological sites continue to marginalize in the present those who US society marginalized in the past. Since these laws help determine what constitutes historically significant parts of the American past, they and promote disparity in determining whose history we remember and preserve.

[26] *Native Prairie: The Kankakee Protohistory Project and Ongoing Excavations at the Terminal Prehistoric Middle Grant Creek Site in Northern Illinois*

Archaeologists have long explored the early interactions between Native Americans and Europeans in the Great Lakes region of Eastern North America. In particular, they have prioritized investigating these relationships at late prehistoric sites containing European trade goods. However, this narrow focus has led to neglecting late precontact sites that precede this period and which are essential for fully contextualizing these early interactions. In this presentation, we summarize the second year of ongoing excavations of the Middle Grant Creek (MGC) site at Midewin National Tallgrass Prairie in Wilmington, IL. This well-preserved, very late prehistoric Huber phase village expands our understandings of lifeways during the final period before European arrival. As one component of the broader Kankakee Protohistory Project, excavations at MGC refine existing understandings of Huber communities with particular focus on human-environment entanglements, mobility, and long distance trade. In this presentation, we summarize the geophysics, excavation, and ongoing analyses at MGC and contextualize the regional significance of the artifact assemblage, especially unexpected finds such as marine shell, painted pottery, and unique points. Conducted at one of the few single component sites in the region, this public archaeological project exposes the diversity of terminal prehistoric assemblages in ways that continue to unfold.

[247] *Engaging Community in Climate Change, Heritage Resource Management and Citizen Science: Examples from Florida's National Parks*

The National Park Service's core mission is to protect and preserve unimpaired for future generations natural and cultural resources under its management. Climate change presents unprecedented challenges as humans have set in motion an unstoppable sea-level rise that will eventually submerge, damage and destroy many heritage resources. Many sites are already undergoing severe erosion, and we struggle with prioritizing limited resources for protecting sites. What are our options? Using case studies from several Florida National Park units including Canaveral National Seashore's massive shell mounds; Everglades' millions of acres of wetlands, subtropical estuaries and prehistoric waterways interconnecting thousands of tree islands and shell work islands; Biscayne prehistoric earth middens; and Castillo de San Marco's fortifications, we illustrate various options for planning preservation of resources. A major success in protecting sites has been leveraging partnerships and engaging communities to participate in citizen science—enacting site protection measures, mitigation, ecosystem restoration, building living shorelines, and engaging locals of all ages in participating in heritage stewardship and resource management. These examples illustrate that despite sometimes difficult challenges, large sectors of the American public are eager, willing and ready to build a community of practice to help preserve, protect and understand threatened heritage resources.

[21] *Local Origins, Distant Connections: Exploring Prehispanic Macaw Exchange through Radiogenic Strontium Isotope Analysis at Paquimé, Chihuahua, Mexico*

The prehispanic settlement of Paquimé (ca. 1200–1450 CE) lay at the intersection of traditionally-defined "Mesoamerican" and "U.S. Southwest and Northwest Mexico" (SW/NW) macro-regions in northern Chihuahua, Mexico. Extensive evidence of exchange with distant communities exists at the site, including remains of over 300 scarlet macaws; brilliantly plumed birds whose natural habitat is located at least 1000 km southeast in the humid lowlands of Mexico. Archaeological and historical records indicate these birds were ideologically and economically significant to SW/NW populations, one reason being their association with the rainy, agriculturally fertile lands of central and southern Mexico. Researchers have concluded that scarlet macaws discovered at Paquimé were largely fed and bred at the settlement, though dietary evidence suggests some birds were imported from distant, southern locations. This study employs radiogenic strontium isotope analysis on a sample of 30 scarlet macaws recovered at Paquimé to assess whether these birds were raised locally or imported. We find most 87Sr/86Sr values are consistent with baseline and local human 87Sr/86Sr values at the site, suggesting local origins, while eight individuals exhibit non-local values. We discuss several possible points of origins for these birds and consider the economic and ritual significance of this pattern.

[39] *Rebirth of the Schooner Royal Savage: Documenting and Interpreting Disarticulated Ship Remains from the American Revolutionary War*
The 70-ton schooner Royal Savage played a pivotal role as the flagship of Benedict Arnold's squadron in the American Continental Army's defense of Lake Champlain during the first year of the American Revolution. Misfortune led to her sinking during the Battle of Valcour Island in 1776, and the wreck was left largely undisturbed in shallow waters for over a century and a half until, in 1935, her remains were rediscovered and salvaged for exhibit in a museum that never materialized. Instead, the hull was disassembled and passed undocumented through several owners before being returned to the U.S. Navy in 2015 for preservation, documentation, and exhibit. Currently a disarticulated assemblage of deteriorated timbers, traditional and digital (LiDAR, photogrammetry) recording methods are being used to document, interpret, and reconstruct Royal Savage to better understand the design and use of this early and rare U.S. naval vessel. This presentation provides a brief history of the sinking and recovery of the hull and over 3,000 associated artifacts, the misguided transfer of materials over the course of 80+ years, and an overview of the current documentation and interpretation efforts—which aims to breathe new life into an old collection.

Scott, Alyssa (University of California Berkeley)

[85] *Tuberculosis Sanatoriums: Historical Archaeology, Landscape, and Identity*

This paper examines the archaeology of the Weimar Joint Sanatorium, an institution which functioned as the county tuberculosis hospital for fifteen counties in California during the early twentieth-century. Field data from topographical survey, historic structures recording, geophysical survey, and surface collection are interpreted along with historical information in order to understand how the institution and people connected to it were situated within the larger landscape. Within the institution and surrounding communities, people navigated narratives about health, illness, disability, gender, race, ethnicity, age, class, and other forms of identity. Tuberculosis sanatoriums as a building type occupied a space midway between an institution and a domestic space, and tuberculosis sanatoriums consisted of a variety of building configurations, from dorms to private cottages. Archaeology can be used to understand narratives about the body and normative expectations which are embedded in the built environment and the landscape, and identifying these narratives is an important step towards destabilizing structures of inequality and stigma.

[324] *Abandonment Processes in Manabi, Ecuador: Ethnoarchaeological Interpretations from the Cloud Forest*

The purpose of this research is to determine the manner in which site abandonment occurred in Manabi, Ecuador. The Manteño were one of many pre-Hispanic cultures exchanging local resources, engineering new technologies, and mass-producing goods along the coast of Ecuador. Successful in their chiefdom and independent from the expanding Inca Empire, the Manteño remained culturally uninterrupted for more than 800 years. The focus of this research is to understand the interruption and thus abandonment of the cloud forest. In order to understand abandonment processes in the Las Tucas valley, this research uses behavioral and contextual lines of evidence. Areas of activity are established by comparing soil chemical indicators (phosphate and pH), with ceramic analysis, and overall artifact distribution. Pre-abandonment behavior will then be examined within the social, political, and environmental context of the last occupation at site C4-044. The sum of this information will be further assessed in accordance with ethnohistorical perspectives from individuals whom participated in the abandonment of a modern day village in the cloud forest. This investigation supports a gradual and planned abandonment of site C4-044, with evidence for ritual abandonment.

[74] *Dates Too Old?: Mixed Carbon Reservoirs Integrate Carbon from Freshwater Reservoirs and the Atmosphere*

Sources of carbon in wetlands and calcareous areas represent unique challenges for interpreting the archaeological radiocarbon record. Atmospheric carbon dioxide is assumed to be the only carbon source for photosynthesis. However, dating modern and historic reference fish and modern reference wild rice indicates the presence of ancient carbon in bones and plant material. Dating four historic reference fish obtained from the Mississippi River in 1939 in southeastern Minnesota yielded four distinctly different dates that do not overlap. Instead, they span 1223 to 307 BP, leading to the conclusion that dissolved inorganic carbon (DIC) and perhaps other ancient carbon contributes to a freshwater reservoir affect. Trophic level of the fish (and their diet) is implicated in this date range since they were caught in the same river, probably during the same fishing expedition. Adding additional reference fish, including northern pike, caught elsewhere in the state returned differential offsets implicating geology and DIC as sources of ancient carbon. Wild rice harvested in 2015 yielded similar age offsets to the highest trophic level fish, suggesting both high trophic level fish and wild rice take in carbon from both the freshwater reservoir and the atmosphere. Implications for dating archaeological materials are discussed.

[78] *SSEAS of Change: Sport Divers, Heritage Monitoring, and the Future of Submerged Resources Management*

The growth and sustained popularity of scuba diving has resulted in increased visitation to historic shipwrecks and other submerged heritage sites. In Florida, one of the top diving destinations in the world, archaeologists and resources managers are concerned with the ongoing preservation of the state's underwater cultural heritage, both as heritage tourism attractions and as tangible parts of our common maritime heritage. The Submerged Sites Education & Archaeological Stewardship, or SSEAS, workshop was developed by the Florida Public Archaeology Network to train sport divers in non-disturbance recording techniques in order to engage divers in preservation ethics and methods, instilling a preservation mindset while developing teams of trained assistants for state managers. After several years of workshops, FPAN is using lessons learned and new strategies to adapt the SSEAS curriculum to the changing needs of both managers and divers, including advanced monitoring of sites, in situ preservation technology, and citizen science initiatives.

[97] *An Archaeologist amongst Geneticists: Overview of My Experiences as an Archaeologist in an Ancient DNA Laboratory*

In this paper, I provide insight on the field of ancient DNA (aDNA) analysis from my unique perspective as an archaeologist employed in a leading aDNA laboratory. Ancient DNA research has advanced so much that genomic data from thousands of individuals across the globe are now available for study. These data are allowing geneticists and archaeologists to conduct studies that provide new insights into migration, demographic transitions, and relatedness of ancient individuals. They also afford an entirely new dataset to examine longstanding archaeological questions. While aDNA analysis is having a significant impact on interpretation of the past, due to the very rapid growth and development of the field, archaeologists might find themselves falling behind on increasingly complex methods and numerous publications. Thus, I provide a brief overview on the process of aDNA research. Additionally, this paper addresses some of the recent controversies in aDNA studies, such as "sample hoarding," the seeming focus on European samples, and ethical issues surrounding aDNA analysis. Finally, while there certainly have been many fruitful collaborations between archaeologists and geneticists, there have also been disagreements about results and data interpretation. I therefore also examine how archaeologists and geneticists can better collaborate in future research.

[99] *Lithic Taphonomy and Digital Hydrogeologic Models: A GIS Based Approach to Understanding the Formational History of Surface Assemblages*

Surface assemblages play an important role in understanding human behavior. However, modern erosional processes—specifically flowing water—can limit the behavioral inferences that can be gained from surface assemblages by transporting materials from their original discard sites. The influence of these processes can be observed in the size distribution and condition of surface lithic assemblages. The topography and geomorphology of the landscape heavily dictates the degree to which fluvial processes erode and redistribute artifacts. Thus, considering formation processes alongside aspects of topography and geomorphology provides a means to investigate the extent to which modern geomorphological processes have altered surface assemblages. Here, we use digital terrain analysis to explore this relationship between the surface assemblages and modern erosional processes. We characterize the location of surface artifacts from the Koobi Fora Formation, Kenya, by stream power (erosive potential) and topographic wetness (the potential for water to pool). We then pair these data with attributes of stone tools that reflect post-depositional damage. We assess the overall influence of hydrological processes on the spatial arrangement of surface assemblages. A discussion of the applied methods and preliminary results is presented. This research was supported by the U.S. National Science Foundation, OISE awards 1358178 and 1358200.

[42] *Managing the Effects of Erosion and Sea Level Rise on Archaeological Sites at Fort Eustis, Newport News, Virginia*

Fort Eustis, part of Joint Base Langley-Eustis, located on Mulberry Island along the James River in Virginia, is extremely vulnerable to the threat of erosion resulting from sea level rise, increased tidal range, and flooding from increased rainfall and storm surge. Currently, dozens of archaeological sites on the island are experiencing damage resulting from erosion, including sites where human remains have been found protruding from erosional scarps. To meet the installation's short and long-term planning needs and their regulatory obligations under the National Historic Preservation Act, the Fort Eustis Cultural Resources Management Program implemented a study of the effects of sea level rise and shoreline erosion on 31 threatened archaeological sites at Fort Eustis. The interdisciplinary study involved archaeologists and coastal engineers from AECOM and examined historic and current erosion rates and future sea level rise projections, conducted site visits, developed comprehensive risk assessments, evaluated of current and long-term threats, and generated potential management strategies. The installation currently uses the data from the study to establish priorities regarding which sites to evaluate for significance, to develop cost estimates, and to aid when deciding whether to protect a site or to conduct data recovery.

[163] *The Economic Relationships of Epicentral and Peripheral Households at Piedras Negras, Guatemala*

More than half a century of archaeological and epigraphic research at Piedras Negras has produced one of the best understood epigraphic corpus in the Maya region and provided archaeologists with a plethora of information related to the nature of rulership, courtly life, and the regional political landscape of the Classic Period. Despite this work, questions persist about the economic structure of Piedras Negras households. Here we present the results of recent investigations undertaken at Piedras Negras and situate them in the context of earlier research at the site and its hinterlands, to better characterize the relationship of epicentral economic infrastructure and near-periphery residential occupation through the lens of the house and household. Particularly, we explore the relationship of residential economies to larger-scale economic processes in the kingdom.

[44] *A Greasy Mess: Reconsidering Prehistoric Bone Grease Extraction and Its Implications for Site Interpretation*

Ethnohistoric accounts and archaeological evidence show that North American Indigenous hunter gatherers utilized fats and oils rendered from smashing and boiling faunal bone for dietary and other uses. In the archaeological record, evidence of bone grease extraction is interpreted from fractured faunal remains recovered from midden deposits and thermal features. However, most archaeological studies of bone grease extraction tend to focus on subsistence to the exclusion of other uses. This preoccupation with subsistence has often led to formulations of indigenous lifeways as pure response to environmental conditions. Most notably, the idea that prehistoric bone grease processing was a response to resource stress is a topic of vigorous discussion.

Archaeological studies of bone grease processing have mostly overlooked its other uses. For instance, bone grease was commonly mixed with ocher, charcoal, and other minerals to make grease paint for decorative, ritual and medicinal uses. Our review of ethnohistoric literature coupled with archaeological data from sites in Texas shows a strong correlation between pigment minerals and bone grease processing. This has important implications for how bone grease processing locales are understood, indicating that the rendering of grease had a function in social life that went well beyond subsistence.

[325] *Cultural Icons: Understanding Social Identity through Iconography in the Contact Era Pueblo World*

The arrival of the Spanish shattered the Pueblo people's worldview in the Rio Grande during the 16th century. Nevertheless, the Pueblo people held onto specific icons that socially identified them as Pueblo, while yet creating Spanish commissioned pottery and other Spanish materials. The 1680 Pueblo Revolt and cultural revitalization movement by Puebloan groups sought to return indigenous peoples to their heritage through an emphasis on traditional religious practices and lifeways. Using iconography on historic pottery, this paper will explore the ways social identity can be maintained yet transformed in situations of intense cultural contact. I compare motifs on pots from the Northern and Middle Rio Grande, dating from the pre-Contact through post-Revolt period. These areas experienced different degrees of colonization which is evident in the degree to which indigenous or Spanish linked motifs occur on pottery.

Serra, Margot, Jakob Hanschu, Amandine Flammang and Danielle Kurin**[270]** *Using Parry Fracture Data to Further Assess Violence in Andahuaylas during the Late Intermediate Period*

Previous studies of crania showing recurrent trauma suggest high rates of violence in the Andahuaylas province of Peru during the Late Intermediate Period. Through an assessment of direct blow fractures to radius and ulna bones (lower arm bones), we further examined violence in the region, anticipating a high rate of parry fractures. The skeletal remains assessed come from Sonhuayo, a fortified habitation sector of Cachi, a Chanka site in the west-central portion of the Andahuaylas province. Since crania from the site were formerly investigated, locations and types of cranial trauma and parry fracture data can be synthesized to further define the methods and frequency of violence in Andahuaylas during the LIP. Indeed not all types of violence result in parry fractures. De factor our study determined rates of parry fractures to be quite low, while cranial trauma reflects frequent injury. The results suggest that close, defensible hand-to-hand combat was not the primary means of administering violence.

Serrano, Victor (University of Leicester)**[140]** *In the Hunt for Mona Island Guano Miners: Archival Documentation in the General Archives of Puerto Rico*

This paper presents initial archival research from the "Archivo General de Puerto Rico" (Puerto Rican General Archives) relating to C19th-20th guano extraction on Mona island in the Caribbean. This is part of a PhD project which examines the lives of guano miners through archaeology and historic archives. Guano as a manure was highly sought as a fertilizer during the nineteenth century for its high contents of nitrogen, phosphate and potassium, nutrients needed for plant growth. It revolutionized farming practices across the world and catalyzed the colonization of remote islands with the intent of mining them. Very little is known about the daily experiences, regimes, and identities of guano miners on Mona Island, part of the Puerto Rican archipelago. Guano extraction started in Mona Island around 1854 under the Spanish government and lasted until 1936 under the USA government. During this period multiple international companies operated on Mona Island, relying on the manual labor of hundreds of workers. An examination of the lives of guano miners on Mona island is important to understand the hidden histories of itinerant laborers across the Caribbean post-emancipation, but also to shed light on the human story of modern industrial capitalism more widely.

Setalla, Gwen [218] see Young, Lisa

Sexton, Joe (Yakama Nation / Galanda Broadman PLLC)**[253]** *Reflection on Jelderks' Judicial Decision and the Ninth Circuit's Decision in the Bonnicksen Litigation*

The Bonnicksen litigation commenced shortly after the discovery of the Ancient One's (aka Kennewick Man) remains and involved several scientists suing the United States to keep the remains and use them for their claimed scientific purposes. Judge Jelderks, Magistrate Judge for the United States District Court in Oregon, found in favor of plaintiffs in 2002. His decision advances a skewed analysis of NAGPRA cultural affiliation claims that hinders tribal rights and serves as a deterrent for meaningful government-to-government consultations between sovereign tribes and their trustee, the United States. The U.S. Court of Appeals for the Ninth Circuit upheld Judge Jelderks' decision in a far more limited opinion published in 2004. I will focus on (1) Judge Jelderks' analysis, (2) how this decision impacted tribes' advocacy for repatriation of the Ancient One under NAGPRA, (3) how it may impact future tribal advocacy for repatriation, (4) the Ninth Circuit's more limited analysis, and (5) what a proper preponderance analysis of cultural affiliation claims should look like under NAGPRA, consistent with the statute and federal common law precedent on a preponderance burden of proof.

Seymour, Deni**[131]** *Whenever the Twain Shall Meet: Merging Ethnohistorical and Archaeological Data*

Data sources, including documentary and archaeological, represent rich caches, full of mundane descriptions and an occasional succulent morsel that adds to the richness of our understanding of the past or potentially changes those understandings in fundamental ways. Yet facts are situated in frameworks of conventional wisdom, existing reconstructions, methodological practice, and extant data. Many substantial advances effectively and critically combine the particular with the generalizable, recognizing that humans respond in a predictable set of ways given similar parameters. Our work is to understand the variations and exceptions, the boundary conditions, the richness of the cultural overlay, and the effects of time and interaction on more generalizable behavior. Yet, archaeologists and ethnohistorians use data sources in different ways, establishing the question as to whether

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

twain shall meet. Some methodological differences relate to how one selects or weighs documents, and parts, passages, or elements therein, (2) assumptions as to clarity of meaning and soundness of translation, (3) the use of external evidence to assess interpretations, and (4) willingness to cede authority to other sub-disciplines. Apachean and O'odham examples are used to explore these issues and to assess effective tools, such as correlate grids, for reconstructing the past using all applicable data.

[72] *A Local Government and Tribal Collaborative Approach to Cultural Resources Management*

The Pima County (Arizona) Office of Sustainability and Conservation is applying a proactive approach to cultural resources management on approximately 100,000 acres of Conservation Lands the County has recently acquired for conservation purposes. County stewardship and management of these lands brings with it several responsibilities, among them developing a management plan through collaboration with Tribes that guides 1) the identification of Traditional Cultural Properties, 2) monitoring of current and future agents that may impact Traditional Cultural Properties, 3) determining strategies to mitigate impacts to Traditional Cultural Properties. Prior to writing a management and monitoring plan, Pima County began collaboration with several Tribes that have ancestral ties to the Conservation Lands, by holding a series of meetings with each of the Tribes. These consultations documented and assessed the level and focus of Tribal interest, concerns, and needs. This means that Tribal concerns and perspectives are incorporated into planning, fieldwork, documentation, and management protocols. Each of the Tribes observed that this type of proactive approach to cultural resources management is especially valuable. This provides Tribes an opportunity to have meaningful input during both the plan's formulation and implementation.

Sgheiza, Valerie and P. Willey (California State University, Chico)

[179] *Demography of Skeletal Remains from Point San Jose*

A critical question concerning the Point San Jose (PSJ) skeletal remains is the nature of the living population from which the assemblage was derived. We approach this issue indirectly through comparison with other mortality profiles. Here, we report the age, sex, and ancestry of the PSJ skeletal remains, and compare them with those parameters of other groups. The comparative age distributions consist of the 1870 California mortality census, 1870 California living census (as a proxy for a catastrophic population), mortality data from California military regulars, a hospital distribution, and a prehistoric distribution. The PSJ age distribution shows significant differences from all those groups except the hospital distribution. The PSJ sex ratio (approximately 3 females: 4 males) demonstrates similarities with the 1870 California mortality census. Ancestries present in the PSJ skeletal series indicate that Asian or Asian-related individuals equaled the number of European-derived ones, contrasting with the 1870 California mortality census. That mortality census consists of many more deaths among European-related people than Asian or Asian-related ones. Such exclusionary testing allows us to draw inferences about the selection processes at work in incorporating individuals into the PSJ assemblage.

[85] *Healing Places and Objects in Irish Archaeology*

The concept of healing—in any time period—has received relatively little attention in Irish archaeology. While bioarchaeologists have examined ailments and injuries in prehistoric and historic Irish populations, discussion and understandings of how, why, and where people sought treatment, and which treatments were deemed successful, remain elusive. This paper will draw on Gesler's (1992) concept of therapeutic landscapes, most commonly utilized in health geography, in order to examine healing places and material culture in post-Medieval and Historic Ireland. Historical and ethnographic accounts provide an extensive source material on widely used healing concepts integrated into uniquely Irish cultural and physical landscapes, such as visits to spas, sweat houses, holy wells, and rag trees. These and other places where people went to be treated by practitioners or healed through interaction with the built environment, natural world, or supernatural beings often survive as recognized sites today, and their position vis-à-vis contemporary domestic and ritual landscapes will be explored in order to gain a more nuanced understanding of healing in archaeological and historical contexts.

Shakour, Katherine (University of South Florida)

[296] *Choosing Building Materials: Multi-scalar Construction of Identities and Heritage Following Disaster*

Scholars and communities have been discussing ownership of the past for the last few decades, and they have explored ways in which social and political movements empowered communities to reclaim ownership of their heritage. These communities use archaeology and material culture to construct their heritage. However, few scholars have discussed how communities are constructing heritage with respect to disasters and social upheaval. This paper explores the multi-scalar construction of heritage and identity through material culture and archaeology in a post-colonial and post-disaster environment. Through a case study in Ireland, I explore heritage construction motivations and techniques following the Great Famine and the fight for independence through the present day. I compare heritage and identity on a national scale to a regional scale in County Galway and a local scale on Inishbofin, an Atlantic island off the western coast of Ireland. The examination of multi-scalar heritage compares uses of the past following the suffering, death, and mass migration of over a million Irish people. This paper sheds light on how small communities construct their identity with material culture, discusses the disparities between various scale of heritage in post-disaster and post-colonial environments, and explores the consequences of those differences.

[94] *Confronting Popular Perceptions of a Violent Past: Active Learning Strategies for a Large Introduction to Archaeology Course*

One goal of archaeological pedagogy is to make students question assumptions about "progress" and the relationship between modern human beings and their historical ancestors. One persistent idea is that violence has declined over time, which coupled with stereotypical illustrations of the past as

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

particularly savage, influence how students conceptualize violence today. Developing teaching strategies that ask students to confront popular assumptions about violence can be difficult in introductory classes with enrollment of several hundred students. This presentation will describe two examples of implementing active learning strategies about these topics in an introduction to archaeology course at Arizona State University. Engaging students in small group activities within a large, lecture-based class included strategies such as think/pair/share and write/pair/share. Each activity prompt will be presented, along with a discussion of student feedback and suggested future modifications. The activities gave students hands-on experience with archaeological data and incorporated discussions of past violence in the media and popular science writings. Students were required to evaluate the data based on a set of given parameters to help develop critical thinking skills. By contextualizing modern perceptions of past violence around actual archaeological data, this encouraged students to become better informed consumers of archaeology.

Sharp, Kayeleigh (Southern Illinois University Carbondale)

[141] *Beneath the Surface: Steps toward Resolving Gallinazo-Mochica Debates in Peru's Northern North Coast*

Understanding the role of the widespread yet under-recognized art style known as Gallinazo, its persistence alongside the more conspicuous Mochica art style, and the social factors that facilitated their long-term coexistence on Peru's North Coast during the first millennium, are primary concerns of this work. Investigation of the Songoy-Cojal site in the mid-Zaña Valley shows that Gallinazo-Mochica coexistence persisted at least until the 8th century CE (based on new C-14 dates). Many problematic assumptions concerning the role of the Gallinazo (e.g., culture, political or non-cultural entity), however, have emerged in recent decades, resulting from the widespread adoption of conventional stylistic and art historical interpretations. In this paper, I operationalize a new practice-based approach which combines concepts of technological style and technological choice, to explore more meaningful dimensions of these artifacts. Combining techno-stylistic, metric and archaeometric (pXRF and NAA) data, and social network analysis (or SNA) techniques, this work takes several steps toward resolving debates over the nature of Gallinazo-Mochica coexistence. Herein, I present new perspectives on the nature of Gallinazo multi-craft production from various work-related activity settings at Songoy-Cojal, finding that long-standing dichotomies between these two distinct stylistic traditions are far more superficial than previously thought.

Sharpe, Ashley (Smithsonian Tropical Research Institute), Kitty Emery (Florida Museum of Natural History, University of F) and John Pfeiffer (Florida Museum of Natural History, University of F)

[217] *Bringing Two Halves Together: Combining Modern Phylogenetics and Zooarchaeological Analysis to Understand Past and Present Trends of Freshwater Mussels (Unionidae) in Mesoamerica*

For over a century, the taxonomy of the Central American freshwater mussels (family Unionidae) has been the subject of numerous classifications and reclassifications, with naturalists identifying morphologically identical taxa as different genera or species, while at the same time classifying obviously distinct taxa under the same name. Zooarchaeologists at the mercy of these erratic classification schemes have been unable to effectively compare datasets. This study uses a combined zooarchaeological and molecular phylogenetic approach to identify both the ancient and modern freshwater mussels in Guatemala's Pasión River. Modern mussels were surveyed and collected near the archaeological site of Ceibal and then tested to understand their molecular phylogeny. Phylogenetic results were used to identify the archaeological shells spanning the site's history (1000 BC to AD 1000). Field data gathered on the live mussel biology, and interviews with the local residents familiar with the mussels, were used to produce a comprehensive understanding of how the different taxa may have been gathered and used by the ancient Maya. Results indicate that some taxa present in the river today were rare or entirely absent in the past, while certain taxa commonly found at Ceibal millennia ago cannot be found today.

[141] *Tradition and Transformation during the Middle Horizon to LIP Transition: Visual and Compositional Analyses of Tumulaca and Estuquiña Pottery in the Moquegua Valley, Peru*

In many Andean regions, the shift from the Middle Horizon to the Late Intermediate Period, or LIP, is archaeologically identified by stylistic changes. In the Moquegua valley, southern Peru, LIP (ca. AD 1250–1476) Estuquiña architecture and portable material culture is starkly different from that associated with terminal Middle Horizon (ca. AD 950–1200) Tumulaca populations. Until recently Tumulaca settlements were thought to have been completely abandoned prior to the appearance of Estuquiña styles. Incorporating both visual analyses of and compositional derived from LA-ICP-MS analyses of Tumulaca and Estuquiña pottery, I complement the long recognized stylistic distinctions by examining the transformation of productive practices and the organization of ceramic production as Moquegua underwent processes of population replacement and cultural change. Drawing in particular on material from Tumulaca la Chimba, a site with an Estuquiña occupation partially superimposing a Tumulaca occupation, I propose that the ceramic data suggest a more nuanced and complex picture of the transition from the terminal Middle Horizon to the LIP which, in tandem with new radiocarbon dates and excavation data, challenges the assumed temporal break between terminal Middle Horizon and LIP occupations in Moquegua and instead raises the possibility of a period of social interaction between communities.

Shaw, Justine (College of the Redwoods)

[173] *Sacbeob in the Cochuh Region: Barriers or Links?*

During the Terminal Classic, sacbeob were built at three Maya sites in the Cochuh region of west-central Quintana Roo, Mexico. The roads provided a physical connection between portions of Ichmul, San Felipe, and Yo'okop, running between important structures, out to outlying groups, and even to what had likely been separate settlements. Although they would have been used for processions between termini and may have had numerous symbolic meanings, the impact of some of the roadways on the lives of commoners may have instead been that of impeding the flow of transit. An examination of the contexts, features, and physical forms of these roadways shows how, rather than necessarily easing transit in the manner of most modern roads, some sacbeob were set apart as sacred space no longer available for quotidian functions. In contrast, other causeways seemed to be designed to welcome public access, providing for the ready flow of foot traffic along and across their spans. This difference, related to the intended function, reveals another way in which what archaeologists consider to be one feature class may have been conceived of as multiple categories by residents.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Sheehan, Beth (University of Illinois at Urbana-Champaign)**[222]** *The Influence of Journal Publishers on Archaeology Data Sharing*

Journal publishers are poised to influence and be influenced by disciplinary attitudes toward data sharing. A previous study of the relative strength or weakness of data sharing policies in journals that publish gene microarray expression data (Piwowar and Chapman, 2008) found that stronger data sharing policies are generally associated with higher journal impact factors and an increased percentage of articles with shared and available data. In fact, even the presence of a “weak” policy increased data sharing, as compared to journals with no data sharing policy. This poster presents the summarized findings of a similar review conducted in 2017 that examines the presence/absence and relative strength of data sharing directives from the top 50 archaeology journals (as ranked by the 2016 Scimago Journal Rank indicator scores). The results reveal a snapshot of the current state of the archaeology discipline’s data sharing attitudes as reflected in the culture of archaeology publishing and scholarly communication, and inspire discussion about the potential benefits and drawbacks of publisher-encouraged or mandated data sharing in this discipline.

Sheets, Kimberly (Washington State University)**[187]** *Understanding Changes in Lagomorph Proportions within the Homol’ovi Settlement Cluster, Northeast Arizona*

Lagomorphs (rabbits and hares) were a critically important dietary resource for inhabitants of the pre-contact American Southwest, where they typically dominate faunal assemblages. It is useful to examine proportions between genera of lagomorphs—specifically, cottontails (*Sylvilagus* sp.) and jackrabbits (*Lepus* sp.)—to elucidate information about the past environment and how it might have changed in response to human actions. Based on habitat preferences and predator evasion strategies, the lagomorph index is a useful tool for examining this relationship and tracking how the environment might have changed throughout time. This poster examines changes in the lagomorph proportions through time within the Homol’ovi Settlement Cluster, a group of five Pueblo IV villages occupied at various points between AD 1260 and 1400. Results show an increasing reliance on cottontails over jackrabbits through time. The implications of this trend are discussed through optimal foraging theory.

Sheets, Payson (University of Colorado) and Christine C. Dixon**[173]** *Constructing the Social Fabric of a Community: Household Service Relationships to the Ceren Village*

Volcanic preservation allows for detailed reconstructions of a variety of social relationships and material boundaries at Ceren. Service relationships are inferred from proximity of households associated with special-function structures, such as the religious complex, the sauna and the community governance center. These data show a social function of providing service relationships from each household to the community. Socioeconomic functions are also evident in the form of other specializations, one household producing specialty crops, another with spindle whorls for fine threads and groundstones, and another for painted gourds. The interpretation of evidence from Cerén documents the division of household groups into social units responsible for different economic needs within the community, which wove a deep fabric of social interaction. Physical markers of the Cerén landscape formed boundaries, agricultural fields separated by crop type, a sacbe and drainage canals dividing fields and providing transition from the border of the site center into the manioc field south of the community, and notably a large adobe block demarcating a division of space between fields, likely related to ownership. Such evidence from Cerén provides the rare opportunity to examine in detail the social obligations and physical divisions of a Classic Maya farming community.

Sheets, Payson [142] see Dixon, Christine C.

Shellenberger, Jon (Native Anthro)**[255]** *The Original Cultural Resource Managers of America: Going beyond Integrating Native Perspectives in Cultural Resource Management*

The perspectives of Native Americans within the field of archaeology can no longer be tossed aside. Native Americans have placed special cultural significance on archaeological resources long before 1492. The relationship between Archaeology and Native Americans is well-known to be a tumultuous one. The integration of Native American perspectives on the management of resources significant to tribes has been a continuum of paternalism and racial segregation. Archaeologists are in a rare position to perform great services, as well as great harm to significant Native American archaeological resources. The integration of Native perspectives within cultural resource management has been rewarding for all parties and expand our scientific understanding of human land use through time. This will force us to challenge existing biases and break down barriers to entry for Native American participation. In addition, a more diverse and holistic approach will provide different opportunities to resolve issues within the framework of existing laws and identify where changes need to be made in their application.

Shen, Chen [24] see Cheng, Wen Yin

Shen, Dewei (Yale University)**[24]** *Inscribing Behaviors on Oracle Turtle Plastrons: A New Method to Analyze Tributary Networks of Late Shang China (c. 1250 BCE–1046 BCE)*

Processed from turtle shells and bovid scapulae, oracle bones were massively exploited by the ruling house of the late Shang Dynasty for divination. As opposed to traditional scholarship that holds primary interest in inscriptions engraved on these bones, I consider late Shang divination in entirety as a technological process that proceeds from the preparation and delivery of bone material via tributary networks all the way to bones’ after-use discard into pits. By switching the attention to the least examined pre-divination and post-divination stages, I focus on the texts of marginal inscriptions, the data of the used turtle plastrons and the records of stratigraphy recovered from Pit YH127 and Pit H3 at Yinxu. I argue that since regional tribute payers, capital scribes and diviners were made bound by the tributary networks of oracle turtles, their major behavioral patterns that aimed to facilitate the provision of turtle shells for divination would have been “recorded” by the altered materiality of the shells at each step of change. To detect and reconstruct such behavioral patterns and the physicality of divination can deepen our understandings of the groups that attended the industry of oracle bones, and thus the nature of oracle bones as well.

Shennan, Stephen**[137]** *Dates as Data: Where Are We Now in Using Radiocarbon Dates to Infer Population Histories?*

Archaeologists have long used site counts and other measures to infer past population histories and such efforts have always been criticised by those who point to all the known and unknown unknowns that in their view make such efforts as dubious as getting to the topmost steps on Hawkes’s ladder of inference. In recent years most effort has been devoted to the use of summed radiocarbon probabilities for demographic inference since for most of later prehistory in most of the world it gives a much higher degree of chronological resolution than any alternative, resulting in many cases in a qualitatively new view of population patterns, which have turned out to be characterised by booms and busts. To overcome the many obvious problems to using radiocarbon dates in this way a great deal of effort has been devoted to the development of rigorous methods combined with large-scale data collection. The methods involve either building and testing specific models of population change through time, for example exponential growth, or

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

comparing patterns in different data sets by means of permutation tests to see if they are significantly different from one another. The methods, criticisms and ways forward will be described.

Shepard, Lindsay (University of New Mexico)

[269] *Assessing the Effectiveness of Various Scanning Technologies in Digitally Capturing Fingerprints on Corrugated Wares*
Methodological advances in the study of fingerprints by criminologists have revived an interest in using dermatoglyphic evidence to conduct archaeological research. The analysis of fingerprint impressions left in ceramics is being used to investigate topics such as craft specialization and social organization. While most impressions left in ceramics lack the completeness needed to identify individual potters, fragmentary prints can be used to analyze things such as ridge density. Given a large enough sample size, the analysis of ridge density can be used to determine the sex ratio of potters, information that can be applied towards many lines of archaeological inquiry. As an initial step in conducting ridge-line analysis, I test four surface scanning technologies (NextEngine and HDI Advance 3D scanners, a Dino-Lite digital microscope, and photogrammetry) to determine which will produce images most conducive to performing such an analysis. Consideration is given to multiple factors, such as image resolution, ease of use, processing time, and the cost of operation. Gray wares from Chaco Canyon, New Mexico are used to conduct the analysis.

Shepard, Christopher (College of William and Mary) and Martin Gallivan (College of William and Mary)

[328] *Persistent Places, Enduring Objects: Ritualized Spaces and Things in the Powhatan Political World*
Seventeenth-century colonial chroniclers repeatedly mention a series of places and objects that surrounded political negotiations and efforts at alliance-building by Powhatan societies. While regional scholarship has focused on competition over subsistence resources, regional trade dynamics, and the regulated exchange of “prestige goods” as central to the development of these political structures, we shift the focus toward the engagement between these societies and specific places and objects whose enduring legacies spanned multiple generations. We argue that the development of the seventeenth-century political geography was predicated on the maintenance of persistent ritualized spaces and the circulation of enduring objects whose shifting meanings connected the past and present, bolstered political structures, and facilitated the transfer of power from one generation to the next. Archaeological evidence indicates that shell and copper adornment objects entered the region during the thirteenth century, coinciding with the first appearance of palisade architecture, and the development of intentionally constructed ritual landscapes that served to create individual community identities, while at the same time drawing communities into a cross-regional political system.

Shepherd, Alison (VCP Augusta), Kelly Brown (VCP Augusta) and Josh Wackett (VCP Augusta)

[326] *Teaching Archaeology to Veterans: Case Studies from the Veterans Curation Program*
According to 36CFR79, collections recovered with federal funds must be made accessible to the public for research and educational purposes. However, this goal is deceptively difficult to achieve. Collections can be made available to professionals and archaeology students easily enough, but is there a way that we can involve the public in the process? The Veterans Curation Program (VCP), funded by the United States Army Corps of Engineers (USACE), St. Louis District, has become well known for doing just that; employing recently separated veterans as laboratory technicians to rehabilitate USACE owned or administered collections. USACE and VCP contractors have worked to close the gap between archaeologists and non-archaeologists by developing various reference guides, training exercises, and teaching collections. In this paper, we will highlight a few examples of the aforementioned training aids and examine how they have enabled the VCP’s veteran technicians to process archaeological and archival collections with accuracy and understanding.

Sheptak, Rus (University of California—Berkeley)

[272] *Engaging Archaeology and Native American and Indigenous Studies*
Using concepts proposed and developed in Native American and Indigenous Studies would provide a useful way for archaeologists, especially those dealing with the relatively recent past, to address the challenge posed by indigenous scholars to decolonize archaeology. A few concepts have already been employed by archaeologists in North America, notably Gerald Vizenor’s idea of “survivance”. But as Maarten Jansen and Mixtec scholar Gabina Aurora Pérez Jiménez have shown in their work decolonizing Mesoamerican archaeology, there are even more ways to push forward. In this paper, I present a discussion of a series of concepts from Native American and Indigenous Studies that are being used by archaeologists working in the Americas, ranging from survivance to articulation to refusal to the indigenous archive, showing how the use of concepts developed under a decolonizing framework markedly shift the goals and interpretations of archaeologists.

[131] *The Way Forward: Native and Non-Native Collaboration as well as Multi-disciplinary Research Strategies*
As Native peoples assert their sovereignty over intellectual property as well as land and water, relationships between them and anthropologists are entering a new era characterized by collaboration as well as conflict. Ethical anthropologists in North America recognize that they need to secure tribal/First Nations permission for their research. Sometimes permission is granted only for projects of interest to the tribes themselves. And sometimes publication of that research for a wider audience may be restricted or denied. But the benefits of collaboration result in a much richer understanding of Native and non-Native relations, one informed and shaped by the perspectives of Native people themselves.
The Hopi Tribe of Arizona has been insisting on such collaboration for decades now. Nonetheless, some scholars working on the Hopi people continue to ignore such ethical guidelines and understandings. We argue that Southwestern archaeology, cultural anthropology, and ethnohistory will never progress beyond the limitations of Western epistemologies and lines of evidence biased by Western ethnocentrism and silences until collaboration is embraced and institutionalized as the only ethical and productive way to understand our shared pasts and presents. We discuss Moquis and Kastilam: The Hopi History Project as one example of such collaboration.

Sherwood, Sarah (Sewanee: The University of the South)

[180] *In the Morning House: The Redhorn Cycle Depicted in Rock Art from Kentucky*
This presentation reports on a new rock art site from Kentucky, brought to the authors’ attention by local citizens. Inside a large sandstone rockshelter, more than a dozen black pictographs show several anthropomorphic characters. These images bear distinctive features and regalia associated with the “Redhorn Cycle” hero narrative reported by Paul Radin in 1948 from his ethnographic work among the Ho-Chunk. The rock art from this “Morning

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

House" strongly resembles well-known Mississippian period paintings from the Gottschall Shelter in Wisconsin and some of the paintings in Picture Cave, Missouri. The similarities include both subject matter and how the images are rendered. Morning House extends the geographic range of the Redhorn rock art corpus to the Eastern Woodlands, east of the Mississippi River.

[140] *Resource, Transportation and the Political Landscape of the Chinese Bronze Age*

The political landscape of the Chinese Bronze Age was characterized by controlling the key resource situated in the distant regions from the Luoyang Basin. The study of key natural resources and their transportation networks should therefore be an important facet of research into state formation during the Chinese Bronze Age. The extraction and transportation of key resource, and its relationship with the cultural landscape addresses the basic political framework of the states in Early China. With the geoarchaeological survey into the turquoise and cinnabar mines in the Qinling Mountain Range, this paper explores the political landscape of the first Bronze-Age state, Erlitou, through analysis of geography, resource flow, transportation, and archaeological sites in the Qinling Mountain Range. Moreover, by integrating the materials from 3rd to 2nd Millennium BC in a broader geographical scale, this paper details the dynamic process leading from the prosperity of the fringe areas of the Loess Highland to the Luoyang-centric network. This transformation is not only reconfiguration of the political landscape, but also the preparation of knowledge prerequisite for the political landscape of the Chinese Bronze Age.

Shillito, Lisa-Marie (Newcastle University)

[126] *Feeding Stonehenge: The Potential of Coprolites as Tools for Reconstructing Diet*

The Feeding Stonehenge project combined zooarchaeology with pottery residue analysis to explore the diets and provisioning of the inhabitants of Neolithic Durrington Walls, the settlement associated with the construction of the iconic Stonehenge monument in southern Britain. A lack of preserved plant remains at the site, and an overwhelming dominance of porcine and ruminant lipids in the pottery, suggests that animal products were the major source of nutrition. This research tests this hypothesis through analysis of organic residues preserved in coprolites, which have not previously been incorporated into dietary studies. Can these more unusual forms of evidence provide additional information on non-animal inputs to diet at the settlement? Coprolites identified as human on the basis of sterol and bile acid profiles can be further analysed for dietary residues including plant microfossils.

[65] *Large-Scale Human Sacrifice and Feasting at Sicán, Peru during the 11th-Century Mega-El Niño: A Multidisciplinary Vision*

We present a multidisciplinary summary vision of the natural and cultural contexts and impacts of an 11th century mega-El Niño event and the extraordinary social responses to and consequences of it. Evidence and impacts of torrential rains and associated severe flooding dated ca. 1050 CE have been documented at multiple sites along the Peruvian coast, particularly in the Lambayeque region. The flood buried the Middle Sicán capital of Sicán with fluvial deposits 1.0 to 1.5 m thick. During this calamitous process that may have lasted many months, three episodes of large-scale human sacrifice of well over 200 individuals who were overwhelmingly healthy young to adult males took place near the center of the Gran Plaza of Sicán. There are suggestions of possible live burials. Efforts aimed at the clarification of victim identities and life histories are ongoing, however, the abundance of serving vessels and food remains indicate correspondingly large-scale feasting events that were closely associated in time and space. Resultantly, we posit that these events may have been pleas for the return of normalcy. Within a span of one or two generations, the Middle Sicán polity underwent transformations, likely triggered by adverse effects of this mega-El Niño.

[87] *Concern for the Living, Care for the Dead: Non-adult Burial at the Early Christian Cemetery of St Patrick's Chapel, Pembrokeshire*

Recent excavations below the ruins of a 13th–16th AD century chapel dedicated to St Patrick, at Whitesands Bay, Pembrokeshire in southwest Wales revealed ninety well-preserved burials dating to the 7th–11th century AD. There was an unusually high concentration of non-adults buried at the site, including a number of foetuses and infants. Some of these young individuals received elaborate burial forms, including the use of quartz-topped burials and cross-inscribed grave markers. It is necessary to consider why so much was invested in the burial of those whose lives were so short. This paper will therefore explore how the funerary rites accorded to these individuals reflect the concerns of the living regarding the well-being of society's youngest members in the afterlife.

Shiratori, Yuko (The Graduate Center, CUNY)

[252] *Commemorating the Preclassic Monumental Construction at Tayasal, Guatemala*

Research into the Main Group at Tayasal, Guatemala, revealed that the Postclassic inhabitants re-occupied areas and buildings that were constructed during the Preclassic period. Most of those buildings in the Main Group stand on a massive elevated platform, which was also constructed during the Preclassic period. The Preclassic period was the period during which the construction of monumental architecture such as E-groups and Triadic Group occurred at numerous sites including Tayasal. It was also the period during which ritualistic ideologies and collective identity were established and permeated. At Tayasal, the massive platform was elevated by a natural hill and held several platform groups. Two Triadic groups were constructed at the margin of the site, probably indicating the boundary of the community. The construction effort required for such monumental architecture may be a result of the emergence of a collective community identity and political authorities. In this paper we discuss Preclassic monumentality at Tayasal and how later occupants perceived and incorporated these constructions into their landscapes. Repeated occupation and remodeling of Preclassic architectures in the Postclassic period may mark the commemoration of ancestors.

[64] *The Change and Chronology of Preceramic Mound-Building Practices at the Cruz Verde Site in the Chicama Valley, Peru*
Excavations in 2016 and 2017 at the Cruz Verde site which is located in the coastal area of the Chicama Valley, revealed a stratified record of preceramic mound-building practices. These practices are constituted by various mortuary contexts and are particularly noted for their use of architectural reconstruction, an activity repeated from around 4000 cal. BC ~1900 cal. BC divided into two phases, the CV-1 phase and the CV-2 phase. We conducted a stratigraphic examination of these contexts, and carried out radio carbon dating to further analyze the processes of constructing mound and its change over time. These analyses revealed that accumulation of food waste midden and embedded mortuary contexts caused the growing of mound volume in the CV-1 phase, and the abrupt change to the beginning of architecture construction on the mound: an activity of constructing a room and the reconstructions of floors and walls which led to the division of inside space in the CV-2 phase. These processes indicate that the monumentality of mounds gradually increased in the CV-1 phase as the mortuary and food waste accumulating practice, and the increased monumentality caused the change of the utilization of this place around 2800 cal. BC, in the CV-2 phase.

Sholts, Sabrina

[143] *Ancient Biomolecules and Destructive Sampling at the National Museum of Natural History*

Biomolecular analyses have revolutionized the field of archaeology in the 21st century. Rapid advances in technology have lowered barriers to biomolecular information by increasing the speed, affordability, and effectiveness with which researchers can extract and analyze biomolecules from ancient materials. Amid growing attention on museum collections as a source of samples for biomolecular research, the people who curate and manage these collections are faced with new challenges and considerations. Although destructive sampling is often necessary for the best available techniques, critical questions remain about how to balance the gain of scientific knowledge against the loss of materials for future study.

This paper addresses major issues in biomolecular research and destructive sampling within the context of the physical anthropology collections at the National Museum of Natural History (NMNH) of the Smithsonian Institution. External and internal processes for destructive sampling requests are reviewed, and appropriate conditions and expectations for approved proposals are discussed. Ultimately this paper aims to facilitate ethical and excellent biomolecular research on archaeological remains at NMNH, which has a responsibility to preserve and provide access to its collections in the service of science and for the public, as well as an institutional mandate to increase and diffuse knowledge.

[103] *Parts of a Whole: Reduction Allometry and Modularity in Experimental Folsom Points*

Points were designed for use but also for repair or rejuvenation. Points accumulated in the archaeological record at stages from first use to extensively resharpened. Thus, specimens of a single type could enter the record in a range of sizes and shapes. Resharpening allometry has been documented in many studies, including geometric-morphometric (GM) ones. One hypothesis is that flintknappers designed points as separate "modules" to accommodate their overall function. This hypothesis views the base and blade portion of points as two modules of whole units, designed to perform different tasks and thus treated differently during the design and resharpening process. Using geomorph and the recently developed zooRchGUI that exploits the functionality of R through a graphical user interface, we conducted 3D GM analyses of a set of experimental Folsom points as they passed through successive stages of use, damage, and repair. We report degree of allometric variation in both base and blade as a function in part of number of resharpening episodes, and changing patterns of integration within separate base and blade modules. Results are a step toward calibrating point size and shape to number or degree of resharpening episodes.

[47] *Elko Chronology: Connelly Caves Lithic Analysis and Great Basin Implications*

Consistent Elko chronology in the Northern Great Basin remains elusive to the archeological community. Numerous symptoms can be determined to be the cause of this absence of information, including a lack of in depth analysis in the region, extensive sediment disturbance leading to non-conclusive stratigraphic dating where studies have taken place, and a shortage of differential site comparisons. Connelly Caves provides an amazing opportunity to combat this archeological affliction through the analysis of the convergence of Elko era lithic technologies. Paired with extensive literature analysis, site comparisons and detailed chronological construction, further insight into Elko lithic technologies and implications can be achieved. The completion of this poster will result in a detailed explanation of Elko Lithic technology, including physical identification, construction, use, and chronology. Implications of the importance of using lithic technologies within the archeological record to track cultural transmission and evolution will be discussed, along with the results of in depth analysis of the Elko presence at Connelly Caves. Further extrapolation of the caves geographic importance and history will be addressed and the placement of the lithic chronology into the larger world-view of the Elko Archeological record will bring this undertaking to completion.

[329] *Paleoanthropology and Pedagogy: Raising Horizons for the Next Generations*

The 21st century will be remembered as a period of exponential change within paleoanthropology. Though such developments pose academic challenges, an overlooked issue is how we communicate this information to students. A constantly changing foundation of knowledge that increasingly requires an understanding of complex theoretical techniques, coupled with the importance of student satisfaction surveys, educators are faced with a pedagogical dilemma: stick with 'established' teaching methods though they are increasingly recognised as being ineffective and may even alienate students from their passion of human origins, or invest more of what little time we have in developing new, innovative ways of teaching even if that increases the risk of failure. This paper presents two pedagogical exercises, developed over four years of undergraduate teaching, that 'open up' theoretical concepts in paleoanthropology by removing paleoanthropology entirely. Utilising a pop cultural staple in the form of Star Trek which addresses issues of speciation and diversity relevant to paleoanthropology, these exercises offer an innovative, fun, and informative way for students to learn, understand, and apply the theoretical underpinnings of species recognition and phylogeny; that once understood can be applied to the fossil record with a greater understanding and confidence than more traditional methods currently provide.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Sichler, Judith (Pellissippi State CC)**[90]** *Provisioned and Caught: Historic Perspectives on Diet in the Danish West Indies*

Historic records indicate that during the late 18th and into the 19th century preserved North Atlantic fishes were shipped to the West Indies as a relatively cheap source of protein to feed enslaved persons and also the planter class. However, in historic zooarchaeological analyses of faunal assemblages from the Caribbean, the presence of these food remains is often not identified. Using two sites from the Danish West Indies, a case will be made for the use of fine-screen techniques to ensure adequate recovery of these remains to provide a more complete dietary picture and definitive evidence of provisioning. Additional faunal data show a predominance of marine fish and mollusk remains and limited use of domestic species.

Sillar, Bill (Institute of Archaeology, UCL)**[207]** *Canas, Canchis and Cuzco: What Was the Scale of Community Allegiance in the LIP?*

The Inca encountered the Canas and Canchis ethnic groups when they expanded out of Cuzco. Canas sites in the herding areas of Espinar show larger scale and more developed settlements than most of those in their agricultural region of the upper Vilcanota Valley. This raises questions about the scale of 'community' (village, kinship group, subsistence group, ethnic group). But to address this we need to consider the degree to which allegiance to leaders, ancestors and huacas as well as the seasonal exchange of commodities and labour can integrate spatially separated groups. It is suggested that some aspects of 'LIP' social organisation began to develop in the final stages of Middle Horizon and were widely shared across the Andean highlands. Finally, the developments of social organisation by the Canas and Canchis in the LIP will be compared with contemporary developments in the Cuzco region.

Silliman, Stephen (University of Massachusetts Boston)**[272]** *Beyond the Holes of Archaeology: Paying Attention to Indigenous Academics, Artists, and Activists*

Archaeology continues to need the infusion of indigenous perspectives, not only to take responsibility for the discipline's past in colonial contexts, but also to advance its ability to understand human histories—especially indigenous ones—in respectful, innovative, and inclusive ways. This need is particularly strong for those archaeologists who study Native American cultural and community life just before, right into, and well after the onset of European colonialism and for those who are paying attention to the broader context in which archaeology operates (or doesn't) today as a direct result of those colonial issues. To do so, we often have to get out of our archaeological "holes" to engage with other scholarship and artistic interventions. This paper highlights some Indigenous academics, artists, and activists whose works have influenced me—showing me broadened ways to think about the past, better ways to use archaeology, and deeper contextualizations of the issues well beyond our disciplinary confines.

Silva, Rosicler (Pontifícia Universidade Católica de Goiás), Julio Cezar Rubin de Rubin (Pontifícia Universidade Católica de Goiás), Maira Barbari (Pontifícia Universidade Católica de Goiás) and Sibeli Viana (Pontifícia Universidade Católica de Goiás)**[2]** *New Perspectives in the Geoarchaeological Context of Hunter-Gatherer Sites from the Beginning of the Holocene, Serranópolis, Brazil*

The GO-JA-01 and GO-JA-02 archaeological sites, located in sand stone shelters of Serranópolis excavated from the 1970s to 1990s and earliest at 10,400 years B. P., were occupied by hunter-gatherer and agricultural-ceramic groups. Recent studies have raised hypotheses regarding the appropriation and construction of the landscape by hunter-gatherer groups, based on evidences related to the paleoenvironment and the archeological site formation process in the Rio Verde river alluvial plain. The purpose of this study is to present some of the variables used in approaching the geoarchaeological context, broadening discussions regarding the occupation of the area.

Silver, Josh [251] see Troccoli, Ruth

Silverman, Shari (Washington State Parks & Recreation)**[84]** *Geoarchaeology of Lwalb Old Channel One (45KI815), South Park, Seattle, Washington*

Lwalb Old Channel One, a shell midden, spans both sides of an oxbow within the historic Duwamish River floodplain. The oxbow is buried under the streets of the South Park neighborhood, Seattle, Washington. Also called 45KI815, the site's shell component is light. Therefore, the midden does not mask contemporaneous geomorphological features of the oxbow and surrounding wetland. Visible soil features include the channel; vegetation effects on soil movement; midden migration; possible liquefaction scars; and even old shovel marks, potentially from shellfish harvest. The Duwamish River itself has undergone massive geographical changes. Natural forces governed these changes initially. During the turn of the twentieth century, however, humans significantly altered the landscape. Lwalb Old Channel One's geoarchaeology opens a window into this transition.

Silverstein, Jay (Univ of Hawaii/DPAA) and Hamedy Mashaly (Supreme Council of Antiquities, Egypt)**[32]** *Sacred and Profane Aspects of Water Management in Ancient Thmuis, Egypt*

Water management in ancient Egypt entailed harnessing natural and supernatural forces. Thmuis grew to power in the heart of the Nile Delta evolving as a nexus of Greco-Egyptian ideological syncretism within a riverine/lacustrine environment. Water management challenges included mitigating damage from annual floods, optimizing production, and maintaining transport. To survive in this dynamic hydrologic regimen, the people of Thmuis harnessed and controlled the Nile waters through engineering and spiritual intervention. Over the last several seasons of archaeological study at Tell Timai, evidence of the religious and profane hydraulic infrastructure have been unearthed. A nilometer, well-constructed paved channels, large and small wells, lesser drains, and evidence of floods attest to the effort and investment made in water management. These discoveries help shape our understanding of the relationship between Greco-Roman Thmuis and the lacustrine delta fill environment where it thrived.

Simek, Jan and Alan Cressler**[90]** *Sacred Animal Images in Precontact Southeastern Rock Art*

Walter Klippel has always focused his research on animal remains from archaeological sites, especially from Southeast North America. In honor of his retirement, we review how animals are depicted in Precontact rock art sites from the region he knew so well. A wide variety of creatures—mammals, birds, reptiles, fish, and even insects—were illustrated by ancient southeastern artists. Animal imagery appears in both open air and cave art, although

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

the kinds of animals vary between these two contexts. The animals used most intensively for food, however, were less commonly drawn on rock and cave walls. Animals that were depicted most often were those who could cross between land and water, from the air to the ground, or from the surface to subterranean worlds. We argue for a spiritual aspect to rock art animal images.

[99] *Zooarchaeological Analysis of a Late Pleistocene Interglacial-Glacial Transition at Pinnacle Point Site 5–6, South Africa*
Understanding if and to what extent early anatomically modern humans adapted to dramatic climatic events is essential to human origins research. Pinnacle Point—a complex of cave sites and rockshelters along the southern coast of South Africa—offers a unique opportunity to study human adaptability through time. The long sequence at Pinnacle Point Site 5–6 (PP5–6) spans 164–44 thousand years ago and encompasses two Interglacial to Glacial Marine Isotope Stage transitions (Stages 5–4–3). This study analyzes faunal remains dated to the MIS 5–4 transition occurring early in the sequence at PP5–6. The change in climate during this transition caused the Paleolithic coast to retreat, possibly necessitating a change in resource procurement strategies by humans occupying the cave. The extent and nature of this change is examined through surface modifications (i.e., cut marks, percussion marks and notches), extent and location of burned remains, and the species composition of fauna transported to the site. Preliminary results suggest that the frequency of surface modification and burning increased during the transition. This zooarchaeological analysis will add to research on the adaptability of early humans to environmental shifts at Pinnacle Point.

Simmons, Alan (University of Nevada Las Vegas, Department of Anth)

[41] *Aquatic Neanderthals and Paleolithic Seafaring: Myth or Reality? Examples from the Mediterranean*
It long has been assumed that most of the world's islands, especially remote ones, were first visited or colonized by fully modern humans. With few exceptions, these events occurred late, during the Neolithic or later, with an implied assumption that most islands could not support hunters and gatherers. We know that this scenario is no longer viable, with examples from Australia and southeastern Asia, such as Flores and Sulawesi, suggesting considerable antiquity extending prior to the emergence of both modern *Homo sapiens* and Neolithic economies. In this presentation, I summarize some of the emerging data from the Mediterranean that suggests pre-Neolithic, and in some cases, pre-modern, seafaring to some of the islands. Also addressed are the substantial problems of documenting and dating such sites. Finally, I conclude with the implications of systematic seafaring in human evolution, especially as it relates to the considerable skills required for seafaring, such as long-term planning, adequate technology, navigation abilities, and, ultimately, "why" such activities would even be undertaken in the first place. If pre-modern seafaring can be adequately documented, and shown to be systematic rather than random or one-time events, it indicates that these early humans had cognitive skills similar to fully modern people.

Simmons, Scott (University of North Carolina Wilmington)

[302] *The Integration of Island and Mainland Maya Communities: Perspectives from Ambergris Caye, Belize*
After a span of over twenty years archaeological investigations have resumed at the San Pedro site, located in downtown San Pedro, Ambergris Caye. Investigations in the early 1990s revealed portions of a Spanish contact period Maya community that was settled as early as the 14th Century CE. Based on previous as well as ongoing investigations at the San Pedro site and other Maya sites on the island and the mainland, it appears that communities on the cayes were linked to one another in various ways. Likewise, communities on the island shared certain characteristics with those on the mainland of northern Belize, most notably in the areas of material culture and mortuary behavior. Here the results of investigations in previously untested areas at the San Pedro site are summarized, and the evidence for Maya cultural adaptations to changing environmental and social conditions on Belize's coast is highlighted. Research conducted on Ambergris Caye also draws attention to the similarities the San Pedro site and other sites on the island share with those on the mainland of northern Belize, as well as the unique characteristics of the island sites, particularly with regard to their architecture and settlement characteristics.

[286] *Illuminating Haiti's Royal Past: Advancing Analytics through 3D Data Fusion of Terrestrial Surface Models and Subsurface Geophysical Data*
Since 2015, the Milot Archaeological Project has conducted a series of archaeological explorations at the Royal Palace of Henry Christophe in the town of Milot in Northern Haiti. This site, called Sans-Souci, was a principal site of political authority in the short-lived Kingdom of Haiti (1811–1820) and is a UNESCO World Heritage site of paramount importance to national development strategies in Haiti. Working with the Institut National du Patrimoine Culturel (Haiti), the Bureau National d'Ethnologie (Haiti), the Center for Advanced Spatial Technologies (University of Arkansas), and the Center for Digital Archaeology (CoDA), the Milot Archaeological Project sought a research strategy centered on minimally invasive excavation, maximal data recovery, and rapid reporting. This paper outlines the results of ground penetrating radar and terrestrial laser scan surveys conducted by CAST and explores the utility of combining these 3D datasets to investigate research questions regarding construction phases that would otherwise be difficult, if not impossible, to address using traditional methods. This effort aims to elucidate the analytical potential of employing advanced 3D data fusion and visualization methods beyond mere documentation.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Simova, Borislava (Tulane University)**[129]** *Negotiations in the Ritual and Social Landscape of Actuncan, Belize*

Our understanding of the ancient Maya is informed to a great extent by the material remains of ritual performance in both domestic and public contexts. Maya populations throughout Mesoamerica were united by a shared cosmology patterning the timing, location, and material aspects of ritual performance. Yet, ritual was not a static or rigid construct, dutifully replicated across populations. At the site of Actuncan, Belize, we find that aspects of domestic ritual cycles,—including form, content, placement, and frequency,—show a flexible, even creative approach to ritual. In each foundation, renovation, and termination of a house, the inhabitants had the opportunity to carry out rites before groups of varying sizes, conveying a sense of community in some and distinction in others. These performances, and their material remains, were key components in the literal and figurative construction of the Actuncan community, as commoner and elite households actively reworked architectural forms and ritual templates to either perpetuate existing identities or signal new trajectories. This paper examines household ritual deposits associated with construction events as resources used to different ends by elites and commoners to negotiate interactions between existing physical structures on the landscape and sociopolitical structures in the Actuncan community.

Simpson, Nick (Colorado State University) and Christopher T. Fisher (Graduate Advisor)**[31]** *Using LiDAR to Map an Ancient Purépecha Water Management System in ArcGIS*

Recent applications of LiDAR technology at the Late Postclassic city of Angamuco, located in the heartland of the ancient Purépecha Empire in modern day Michoacan, Mexico are allowing for the identification and analysis of urban features in innovative ways. A complex system of constructed water management features consisting of reservoirs, sunken plazas, and connective canals were a vital form of infrastructure that were required for the movement of water across the dynamic landscape upon which the city is located. Access to water played a crucial role for the occupants of Angamuco in everyday life, and for the maintenance of inner-city gardens located throughout the city. Using various tools in ArcGIS to render different visualizations and employing mapping contours at various scales, my aim is to identify and measure the natural depressions and constructed features that compose the water control system across the site. The primary goal of this research is to better understand the hydrological makeup of the city and surrounding landscape as well as to better understand the ways the inhabitants of Angamuco organized themselves to optimize access to water throughout the year.

Sims, Marsha**[180]** *A Mesoamerican Culture Hero Legend in Western U.S. Rock Art*

Research ties Mesoamerican search for ancestors to U.S. rock art. A hero in Mexican Aztec legend fought his sister, Coyolxauhqui, and the titans, decapitating her, rolling her body down the mountain, and leaving her head on the mountain. Coyolxauhqui is a floating head on Mesoamerican murals, decapitated and dismembered on the Coyolxauhqui stone. She was the moon, queen, and an avatar of their Earth Mother. She is commemorated in Basketmaker and later rock art in Colorado and Utah at 5 Faces and 4 Faces pictographs in Davis and Salt Creek canyons, and in Bullet Canyon, Little Rainbow Park, and Cub Creek. The Earth Mother is represented as unclean, covered with snakes in Mesoamerican iconography. In North America she is rendered in charcoal at Bullet Canyon, Hog Springs, Black Dragon Canyon, San Rafael Swell, Horseshoe Canyon, and presented in this research is a newly recorded pictograph in a deep crevice along the eastern Front Range. The hero, as the hummingbird, is in Tsankawi and Long House ruins, Black Canyon, La Cieneguilla, San Crisóbal, and Galisteo. Titans, as proboscideans, are at Bullard Cove, Shay Canyon, Colorado River gorge, and Indian Creek Canyon.

Sinclair, Jacinda (Memorial University of Newfoundland)**[36]** *The Complexity of Archaeological Site Revisits: A Case Study from Labrador*

The five sites recorded in Junius Bird's 1934 survey of the Hopedale area are both culturally important to the local Inuit community and to the history of the creation of archaeological narratives about the Labrador Inuit. Recently, the Hopedale and Nunatsiavut governments have stated a desire for additional archaeological research prompting Memorial University to revisit the Avertok and Karmakulluk sites to conduct additional excavations. In the 83 years that have passed since Bird's work, many transformations have occurred within archaeological theory and methodology and this time period has also seen many transformations within the town of Hopedale and its community. The effects of these transformations on the current research are complex, presenting both advantages and disadvantages and impacting both the data obtained and how it is interpreted and utilized.

Fecal biomarkers have proven to be a valuable tool to identify the likely source of fecal matter and have successfully been applied in archaeology. They provide direct evidence of the digestive physiology and diet of the source, and critical data to assess the origin of fecal deposits. 5βstanols can be used as fecal biomarkers because they uniquely form in the gut of higher mammals during metabolic reduction of sterols. However, the actors of this

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

microbial conversion still have to be elucidated and only a few cholesterol-reducing strains have been isolated (only one from human feces). Genes or enzymes involved in this metabolism are still unknown.

Here we present GC-MS and genomic data from fecal samples collected from healthy individuals with different diets and lifestyles. Our results show high diversity in lipid content which can be related to inter-variation of gut microbiome. Almost half of our donors showed little or no conversion, presenting elevated levels of cholestadiene. Our study shows the complexity of 5 β stanols production in the human gut and its application to archaeology. Further investigation into the microbial actors of this conversion could open a new window into the study of ancient microbiomes and their role in human evolution.

[132] *The Incas in Nasca: A Review of Data from the Northern Drainage*

Little research has been conducted in the Nasca region to explicitly improve our understanding of the nature of Inca occupation in the region. A while back, Menzel (1959) noted the lack of local monumental architecture associated to Inca sites in Nasca. In contrast to the Ica valley, surface data from sites in the Nasca area suggest that local populations lacked socio-political complexity and were organized at the level of simple chiefdom structures. Later on Schreiber (1992) suggested that the integration of the territory was achieved by adding an administrative tier to the local settlement pattern. However, there is no known local settlements which are spatially associated to Inca buildings. Schreiber suggests the Incas' interest in Nasca was due to its strategic location at the junction of the highland with the coastal Inca road. In this paper, I use data from excavations at Huayuri in the Santa Cruz Valley in the Nasca drainage to explore the nature of interactions between local households and the Inca state. I will focus on the analysis of ceramic material to delineate possible cultural and economic interactions. Also, I will draw on surface data from three other sites to further understand this relationship.

Skaggs, Sheldon (Bronx Community College CUNY)

[256] *Caches, Burials, and Vases, Oh My: Ritual Deposits in an Elite Courtyard at the Ancient Maya Site of Pacbitun, Belize*

Recent investigations in a large, enclosed courtyard on the southwest corner of the ancient Maya site of Pacbitun, Belize, revealed evidence of successive emplacements of ritually important deposits. Initial analysis of the ceramic material suggests that the entire courtyard plaza has only one or two floors, with construction and use only during the Late to Terminal Classic period (600–900 CE). Five caches and two cyst graves were related directly to the plaza floor. The caches consisted primarily of ceramics, but some also included jade and obsidian eccentrics. The two cyst graves were on the western and eastern edges of the central excavation unit. Additional graves, with slate capstones, were found west of the central unit. Either these were initially intrusive through the plaza floor, or subsequent revisiting of the burials breached the plaza floor. A burial on top of the westernmost slate capstones was particularly interesting, with associated fragments of a partially restorable Uluva Valley marble vase, a pair of carved shell atlatl finger loops, jade inlaid teeth, and shell and bone grave goods. The burials, caches, and associated artifacts are compared with other Belize Valley and lowlands sites, illuminating relationships between ritual practices across these areas.

[136] *Ritual Performances in and around Caves in Bronze Age Sardinia*

This paper understands performance as an embodied, site-specific and temporary event. It consequently emphasizes the diversity of ritual performances identifiable archaeologically, not only in the context of different types of cave and rock-shelter, but also between these and other types of site in the landscape. In doing so, the paper evaluates the liminality of these places and ritual performances, which were—to varying degrees—separated spatially, temporally and symbolically from the rest of life. It also considers the extent to which traditional practices were transformed over the course of successive performances. Mortuary rituals in Bronze Age Sardinia are used as a case-study. Mortuary practices (and especially the treatment of human remains) identified at cave sites, megalithic tombs and rock-cut tombs are compared. Particular attention is focussed on a group of Bronze Age burial caves and rock-shelters excavated and studied recently by the authors in the territory of Seulo in central Sardinia.

Skeens, Jeremy (University of Iowa)

[26] *Sifting through the Sherds: An In-Depth Look at the Ceramic Assemblage from Woodpecker Cave (13JH202)*

Woodpecker Cave (13JH202) provides a unique opportunity to study variation in ceramic technology and resource allocation during the ceramic production process at a Late Woodland East-Central Iowa site. Excavations by the University of Iowa field school spanning six seasons have recovered hundreds of ceramic pottery sherds from Woodpecker Cave, including a modest amount of decorated rim pieces and a large number of undecorated body sherds. Previous typological analyses of the ceramic assemblage have supported the hypothesis that the site was host to repeated seasonal occupations spanning hundreds of years. In this study, both quantitative analysis of ceramic thin sections and elemental analysis of sherds utilizing portable x-ray fluorescence (pXRF) were implemented to identify variations in local clay sources, paste characteristics, and potential tempering agents within vessels at the site, as well as local and regional patterns. Additional residue analysis helped to define temporal aspects of the site and allowed for broader comparative analyses involving similar regional research, which can aid in further studies regarding social behavior in the prehistoric Midwest.

Skinner, Dougless, Paul Williams Sr. (Gwich'in Elder), Holly McKinney (University of Alaska Fairbanks) and Michael Koskey (University of Alaska Fairbanks)

[250] *White Eye Traditional Knowledge Camp: Exploring Prehistoric Subsistence Behavior through Gwich'in Traditional Ways of Knowing*

This study explores how indigenous archaeological methods can quantitatively assess prehistoric subsistence practices in interior Alaska. Archaeological sites in Alaska are among the oldest in the Americas, providing valuable information concerning human/animal interactions. Although there are substantial amounts of archaeological information present in the literature, there is a distinct lack of indigenous ecological knowledge. The goal of this project is to combine traditional indigenous ways of knowing with archaeological methods to make inferences about past human behaviors. The traditional knowledge camp, conducted during the summer of 2017 along the banks of the Yukon River, was a collaboration between elder Paul Williams Sr. and the University of Alaska Fairbanks. It was created for elders to teach Gwich'in ways of knowing to community members and students in a traditional fish camp setting. This research utilized that learning space to explore the effects of traditional capture, processing, and cooking activities on fauna in a way which appropriately represented traditional elder knowledge. Isotopic analysis was then used to quantitatively associate the modern subsistence activities to prehistoric behavior. The research to be presented will discuss how the traditional knowledge and the isotopic analysis of this project informed about past human behaviors in the Arctic.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Skinner, Jessica

[306] *Three-Dimensional Musculoskeletal Modeling in Commingled Analysis: A Preliminary Study at the Milwaukee County Poor Farm Cemetery*
The analysis and disentanglement of human skeletal elements from commingled burial contexts is an essential step in creating individual identifications. This commingled analysis often includes a reliance on joint articulations to determine holistic element reassociations. Manual methods currently exist to test joint articulations for potential reassociation, but most appendicular joint articulations fall within the low reliability category for this method (Adams and Byrd 2014). Many cases of commingling at the Milwaukee County Poor Farm Cemetery may benefit from joint articulation designations of these low reliability categories. In an effort to provide additional lines of evidence to support these reassociations, this study investigates the efficacy of a three-dimensional joint articulation simulation technique, using a NextEngine scanner and open source software to test joint articulation designations.

[89] *pXRF Identification of Prehistoric Lithic Artifact Material, Resource Clusters along the Lower Rio Grande*
The U.S.-Mexico border region along the Rio Grande River, separating the southernmost Texas counties (Cameron, Hidalgo, Starr and Zapata) from the Mexican state of Tamaulipas, is a strategic corridor for prehistoric human travel connecting the Gulf of Mexico with the interior of the continent. The area contains a history of human presence extending over 11,000 years, evidenced by a wealth of projectile points that have attracted collectors for decades. To understand prehistoric people's choices of raw materials for making artifacts, we have partnered with local museums and local private collectors to construct a geochemical data set, currently at ~1,000 entries, from modified and unmodified local lithic materials, using portable x-ray fluorescence to measure ratios of selected elements in each sample. We then use cluster analysis to differentiate populations of rock types, notably the wide range of chert types and volcanic rocks found in local rock and gravel units. Unique among the rock types so far identified is the El Sauz chert, with high contents of zirconium and titanium and known restricted outcrops in south Texas.

Slater, Donald (Phillips Academy, Robert S. Peabody Museum, & Brandeis University) and Ryan Collins (Brandeis University)

[134] *Just for the Celt of It: Investigations and Discoveries beneath the Petroglyph Panels of Aktun Kuruxtun, Yucatan*
During 2011 excavations deep beneath the petroglyph panels in Aktun Kuruxtun, Mexico, members of the Central Yucatan Archaeological Cave Project (CYAC) uncovered a small tunnel leading into a previously unknown chamber of the cavern. The discovery came in the final days of the field season, however, and the chamber was too choked with flood sediments to be methodologically investigated. As a result, the passage was reburied. Last summer, CYAC returned to the cave and successfully explored the tunnel and the small chamber to which it led. In the process, the team discovered an altar just outside of the tunnel, and also unearthed a cache of two ceremonial greenstone celts at the threshold of the interior chamber. These finds, and associated organic material, have allowed for a more nuanced interpretation of the ancient usage and chronology of the Petroglyph Chamber in Aktun Kuruxtun. Further, the raw material used in the production of the celts, and their axial positioning within the cave, situates the deposit within wider cultural contexts in Central Yucatan and more broadly across the Maya region.

Slaughter, Mark (Bureau of Reclamation) and Lauren E. Jelinek (Bureau of Reclamation)

[72] *Lessons Learned through Tribal Consultation*
The federal government examines, funds, and constructs a wide variety of projects ranging in size from very small to those that cover multiple states. At any given time both the federal and tribal governments are working on multiple projects of different scales simultaneously. This can create challenges when engaging in consultation, both in the establishment of the appropriate level of consultation and in and the maintenance of those relationships. Establishing productive collaborative relationships between tribal governments and the federal government can be exacting, especially when discussing projects that could modify the landscape. We have found that by meeting "early and often" with tribal officials, we learn from each other and develop a more effective consultation environment. In this paper we discuss our experience consulting with tribal governments to identify sacred sites and traditional cultural properties, and working together to ensure those resources are given the attention and protection they require.

[134] *Means, Motive, and Opportunity: Use of the Sun Pyramid Cave at Teotihuacan Post Termination*
Ceramics and radiocarbon dates indicate that Teotihuacanos ceased using the cave beneath the Sun Pyramid around the middle of the third century CE, at a time when the city was only just entering its "Classic" period florescence. A reverential termination seems quite likely. Evidence also indicates that post termination use of the cave occurred. As there were approximately 1700 years in between cessation of initial use and modern discovery of the cave in 1974, this paper explores the question of when reentry could have occurred. What evidence constrains the time frame? Could Teotihuacanos have reentered? As suggested by ethno-historical sources, could Aztecs have used the cave? I consider means, motive, and opportunity.

Sloum, Diane (Northern Arizona University) and Jaime Awe (Northern Arizona University)

[30] *Contextualizing Xunantunich in the Late Classic Belize Valley through Investigations of Structure A9*
Xunantunich, an ancient Maya site in the Belize Valley, rose rapidly from a minor political center to a powerful regional polity during the Late Classic period (AD 600–900). Previous researchers suggested that this rapid rise was influenced by Xunantunich's relationship with the more powerful polity of Naranjo in the nearby Petén Province of Guatemala. Their argument was based in part on a Late Classic period building program at Xunantunich resulting in a site layout that resembles that of sites in the eastern Petén. Through our investigations of Structure A9, a temple pyramid in the site's civic-ceremonial epicenter, we examine the local and regional socio-political significance of the site, and test the hypothesized influence of Naranjo on Xunantunich's dramatic Late Classic period apogee.

[254] *The Social Dynamics of Ceren's Household Gardens*
The Late Classic Maya village of Joya de Ceren's extraordinary preservation by the Loma Caldera eruption allows for a unique opportunity to not only understand what plant species the ancient inhabitants utilized in their daily lives but also how the cultivation of these plants shaped the social and economic environment. While Ceren has spectacular preservation of extensive outfields of maize, manioc, and numerous weedy species, this paper will focus on the cultivated spaces surrounding the various structures uncovered at the site. Various fruit trees, annual and root crops, fibrous and other

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

useful plants were chosen to be cultivated within the village center. The assorted array of economically useful species reveals the diversification of foodstuffs readily accessible to the inhabitants on a daily basis that weren't just the annual crops planted within the outfields. The gardens further created a distinction between village members and households with various roles and positions implied by what flora each household prioritized as their preferred nearby resources. Additionally, the gardens show the incorporation of plant-derived materials into the political economy of the region. The long history of paleoethnobotanical research at the site allows for a deeper study of the social meanings behind Mesoamerican kitchen gardens.

[66] *Who's Who? Investigating Historic Burials at Chavín de Huantar Peru Using Radiogenic Strontium Isotope ($^{87}\text{Sr}/^{86}\text{Sr}$) Analysis*
 Since 2009, the Programa Arqueológico Chavín has unearthed a series of historic burials from the Monumento Arqueológico Chavín de Huántar. Although the identity of the deceased remains a mystery, initial archaeological and ethnographic evidence suggests that the individuals may be casualties of the War of the Pacific (1879–1883), perhaps even Chilean soldiers who met an unusual and unfortunate fate at the hands of Chavín's residents. The current paper presents radiogenic strontium isotope ($^{87}\text{Sr}/^{86}\text{Sr}$) data from tooth enamel from 10 of these skeletons in order to evaluate the above hypothesis. Results demonstrate that nearly all of the individuals exhibit $^{87}\text{Sr}/^{86}\text{Sr}$ values that fall within Chavín's bioavailable range, suggesting that they were either born locally or hailed from a region with a $^{87}\text{Sr}/^{86}\text{Sr}$ signature similar to that of Chavín. One individual, however—an older man buried in what appears to have been the remains of a military uniform—exhibited a $^{87}\text{Sr}/^{86}\text{Sr}$ value clearly outside of Chavín's range, raising interesting questions about his identity during this politically-volatile phase in Peru's history.

Sluka, Victoria (University of Wisconsin-Madison)

[3] *Knotting Accuracy & Dimension Variation in Modern Turkmen Carpets*
 A pilot study of pile carpet variation and error is carried out on ethnographic Turkmen carpets. No such work has been previously published, and so this analysis provides basic data and conclusions on carpet variation, including type and intensity of variation, to be used as a starting point for further study of archaeological carpet samples. Data is taken from six comparable carpets, informing on two aspects of carpet variation. The dimensions and knot densities of the carpets' motifs are used to examine the variation introduced to the carpets through technological limitations of an upright loom. The carpets are found to be well standardized, with overall dimension and density error rates within range of the published limits of human replication ability (approx. 3%). However, underlying trends in the distribution of this variation informs on the abilities and tendencies of the knotters to correct for limitations of the loom technology. The accuracy of weaving patterns is also analyzed, giving indications of the error rate of the knotters in a highly repetitive task. The knotting error rate is found to be far below the accepted limit of replication, indicating significant, though not uniform use of external aids of manufacture.

[30] *Limited Territorial Control and Incomplete Political Economies in Small States: A Look at the Classic Maya and Classic Greek*
 The limited territorial control of small states, here the Classic Maya, has hindered the development of political economies in several cases. This paper looks at the issue of non-ruling elite interstate economic and political networks, and their effect on the evolution of internal political economies for the Classic Maya. Examples will be drawn from such polities as Copan, El Palmar, and Caracol. A further window into the dynamics of the effect of limited territorial control on political economies will also be drawn from similar examples among Classical Greek polities.

[120] *Tracing Paleoindian Projectile Point Diversity in the American Southeast*
 Paleoindian projectile points occur in high incidences in the American Southeast, and compared to other regions in the East, the Southeast has the greatest projectile point diversity. One effective way to understand this diversity is by tracking broad-scale morphological variation in suites of point traits to build cultural lineages. In this paper, we take a more trait-specific approach. We trace changes in projectile point design to understand the evolution of specific point attributes that were under selection. Through this approach, we explore when and where certain aspects of point design were adopted, what traits were linked or co-adopted, and how these traits may have influenced point function. By tracing changes in specific technological design elements, we hope to identify some of the social and adaptive processes that resulted in such high regional point diversity.

[65] *A Post-Wari World: Late Intermediate Period Defensibility in the Huamanga and Huarpa Provinces of Peru*
 Following the collapse of the Wari empire (ca. AD 1000), a widespread demographic and settlement change occurred in the Ayacucho Region of Peru. People were moving away from the rich farmlands and ritual centers of the flatlands to settle on hilltops and ridges. Many scholars point to strategic defense as a cause of settlement shift during this period—the Late Intermediate Period (ca. AD 1000–1450), suggesting warfare was endemic, while others suggest the sites facilitated agro-pastoralism and warfare was sporadic. This paper presents the preliminary results of two pedestrian reconnaissance surveys conducted in July 2014 and July 2017 in the Huamanga and Huarpa provinces of Peru—the provinces surrounding the Middle Horizon (ca. AD 600–1000) Wari capital. During these surveys, in an effort to assess the role of defensibility in the settlement shift, we considered the general designs and arrangements of architecture at 15 Late Intermediate Period hilltop sites.

[29] *Reconfiguring Normative Funeral Rite in European Prehistory: Second Thoughts on Secondary Manipulation of Human Remains*
 Mortuary variability in European prehistory has long been perceived through the lens of Christian worldview from which the discipline of archaeology originally developed. Expectations rooted in this conceptual perspective inevitably shaped the ways that the archaeological record was approached and interpreted. As a case study we consider the Central European Bronze Age, on which we can deconstruct the traditional 'textbook' understanding of ancient funerary traditions. During this period, general development observed in formal cemeteries is characterised by the gradual shift from prevailing inhumation towards cremation, but with strikingly frequent finds of complete, partial, or disarticulated human skeletons in settlement pits and ditches. We argue that what is usually regarded as a normative burial, or its opposite, i.e. seemingly careless and non-ritual deposition of human remains, may be a very problematic categorization. Gradually accumulated evidence suggests that the most visible forms of human burial in the archaeological record may not have been the dominant type of treatment of the dead. According to our research, secondary manipulation and fragmentation of human bodies, which was turning them into objects of cultural patrimony that could be shared and curated, seems to have been the most frequent destiny awaiting the deceased.

[135] *From Medieval Wool Tunics to Bone Powder: Rapid Degradation of Norse Middens in Southwest Greenland*
 This presentation is one of the products of a series of ongoing inter-connected, international, interdisciplinary fieldwork projects coordinated by the North Atlantic Biocultural Organization (NABO) research cooperative since 2005 in Greenland. The projects drew upon more than a century of prior

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

field research, where four generations of archaeologists described and assessed organic preservation conditions at their sites in several regions of the Norse Eastern Settlement. This created a unique form of “archaeological TEK” (Traditional Ecological Knowledge) that represents an invaluable guide into the changing preservation conditions since the late 19th century. Between 2005–2017 we conducted extensive coring surveys of over 100 Norse middens, and open area and small test excavations at over 15 sites. The results show a shocking and almost complete loss of once outstanding organic preservation in a region where only 60 years ago wood, bones, leather, wool, and feathers were recovered. Our findings draw attention to the destructive process of the modern climate change that has been affecting the organic preservation conditions for at least 60 years, and to the need to organize a circumpolar-wide, international response strategy to rescue the endangered sites and their unique cultural heritage before it is too late.

Smit, Douglas (University of Illinois at Chicago)

[295] *Geology and Governance: Colonial Andean Mercury Mining and the Marroquín Collapse of 1786*

The study of an event may seem in opposition to the investigation of deep time, yet it is difficult to analyze one temporal scale without invoking the other. This paper examines this paradoxical linkage of events and the *longue durée* through the case study of a catastrophic event in the Spanish colonial mercury mines of Huancavelica in the Central Andean Highlands. The Marroquín collapse of 1786 claimed hundreds of indigenous lives, and symbolized the late 18th century decline of Spanish governance in the Viceroyalty of Peru. While this disaster may appear to be a singular event, this paper argues that understanding the causes and consequences of this collapse requires an investigation of how three different temporal scales (geological, institutional, and quotidian) articulated with one another. By investigating how different forms of temporality become entangled with human action, this case study of colonial Andean mercury mining will highlight the spatial and material aspects of social transformation in the archaeological record.

Smith, Alexander (The College at Brockport, State University of New York)

[117] *Indigenous Persistence in the Balearic Islands: Carthaginian and Roman Colonial Engagements in the Western Mediterranean*

The Balearic Islands are the westernmost island group in the Mediterranean. Of the four main islands of the group, Mallorca and Menorca were home to an indigenous Iron Age culture known as the Talayotic people. Their story is considered a minor one by many historians in the grand narrative of Mediterranean domination by Carthage and then Rome. Nevertheless, the archaeology of these two islands has revealed fascinating evidence of the scope and effects of ancient colonialism by these two powers. The groups inhabiting these islands during Carthaginian contact as well as Roman conquest do not display a passive acceptance of colonial influences, nor does the archaeological and historical evidence evoke outright resistance. Yet these groups persisted in settlement structure, religious practices, and even in the funerary realm well into the first centuries C.E. Through the lens of colonial negotiation, it also becomes clear that the islands contained multiple groups of varying identities that cannot be simply understood as broadly “Talayotic.” This paper will examine the ritual evidence from sites on Mallorca and Menorca to understand the varying expressions of these island communities during this period of outside interaction at the end of the first millennium B.C.E.

[30] *Sub-tropical Agronomy on a Variable Landscape: Exploring Classic Maya Farming through Geotechnical Design and the Distribution of Edaphic Variables*

Late Classic hinterland agronomy presents a compelling glimpse into the socioeconomic dynamics of production and demand in the Three Rivers region. This project focused on a prominent house-group located 350 meters east of the site of Dos Hombres which was known to exhibit intensive agricultural strategies as well as a specialized degree of stone working. Additionally, a series of four karst depressions bordered the site and likely leveraged moisture demand resulting from agricultural needs as well as personal requirements. The goal was to delineate hinterland cultivation among the common Maya and to identify stratigraphic evidence of nutrient depletion resulting from exhaustive farming practices. The task of defining the breadth of agricultural strategies was accomplished through remote-sensing, field survey and excavation. Soil sampling was conducted along two terrace platforms and soils were analyzed using the ascorbic acid method for phosphorus determination in order to develop an index of phosphorus availability. While structural analysis of the site’s geotechnical features demonstrated regional cohesiveness in design, the scale of the land management strategy suggested a level of economic complexity witnessed through multiple lines of resource specialization. Soil analysis revealed sporadic evidence of unnatural Phosphorus distributions with increases occurring in subsoil regions.

[231] *Ethics and Best Practices for Mapping Archaeological Sites*

Principle 6 of the Society of American Archaeology’s Principles of Archaeological Ethics emphasizes archaeologists’ responsibility to publically report archaeological investigations with the stipulation that “An interest in preserving and protecting in situ archaeological sites must be taken in to account when publishing and distributing information about their nature and location.” This paper first provides a critical review of current geolocation sharing recommendations and practices, and then describes available methods for dealing with sensitive location data and suggested best practices. Particular attention is paid to geomasking techniques, which communicate observed spatial relationships while obscuring sensitive geographic coordinates. Currently, only two geomasking techniques are widely used in archaeology: aggregating archaeological site locations into grids or administrative units, or placing points that represent site locations at a particular distance from their true locations. These techniques, while useful, are part of a larger and growing suite of tools that visually convey spatial data without revealing sensitive site locations. Principle 6 allows researchers flexibility in tailoring methods of communicating site locations, which is useful given the range of archaeological contexts. However, this work encourages researchers to responsibly exercise that flexibility by incorporating archaeological and environmental data into an explicit decision-making process for representing those places.

[270] *Two Individuals, One Urn Burial from La Real, Peru: A Bioarchaeological Investigation of Urn Burial Practices*

The site of La Real, located in the southern, near-coastal region of Peru, was an elite burial ground where mortuary contexts reveal Wari imperial influence during the Middle Horizon (600–1000 CE). This study examines the mortuary treatment of two human fetus/neonate skeletons placed inside a decorated, ceramic urn and compares funerary treatment to Wari fetus/neonate burials and others in the Andes to evaluate the geographic reach, chronological depth, and cultural significance of this funerary practice.

To estimate age-at-death, the long bones and basilar occipitals were measured, indicating an age of 30–36 weeks in utero for both individuals.

Although we suspect they were twins, thus far no data support or refute that hypothesis. The urn was decorated with Nasca-influenced motifs, and the fetuses/neonates were wrapped in plain, cotton textiles and cotton ropes. Fetus urn burials have also been recovered at Conchopata, a Wari heartland site, and comparisons show some key distinctions. For example, the La Real urn contained a double burial, the fetal/neonate remains were wrapped in textiles, and no other artifacts were found in the urn. These distinctions reflect the importance of local mortuary practices in the face of Wari imperial influence in the region.

[92] *Western Stemmed Tradition Projectile Technology and Raw Material Use in Guano Valley, Oregon*

Western Stemmed Tradition (WST) projectile points mark Late Pleistocene/Early Holocene occupations in the Great Basin. Considerable morphological variability exists among WST points and over the years researchers have come to recognize various types (e.g., Cougar Mountain, Haskett, Parman, and Windust). Because most substantial WST sites are near-surface scatters that likely represent palimpsests of multiple occupations, it remains unclear whether this variability reflects tools used during different time periods, tools discarded at different stages in their use-lives, or tools used by different groups visiting the same places. Using data collected from Guano Valley, Oregon, where one of the largest concentrations of WST points in the Great Basin was recently discovered by the University of Nevada, Reno, we explore these and other possibilities. To do so, we examine the relationship between WST point morphology and raw material type and whether particular WST point types cluster together or are instead generally intermixed.

Smith, Heather (Eastern New Mexico University)

[120] *The Manufacture of Northern Fluted Points: A Production Sequence Hypothesis*

Fluted projectile points have been found in the archaeological record of the North American Arctic for over 50 years. Only recently, however, have fluted points found in buried contexts associated with dateable materials and included in region-wide comparative analyses provided chronological, morphological, and technological evidence to support the cohesion of the Arctic specimens as their own fluted variant: the Northern Fluted Complex (NFC). Few sites have provided the opportunity to observe examples from the NFC discarded early in the production sequence, which can provide a glimpse of Northern manufacture protocols. This paper presents a hypothetical sequence of NFC point production developed using evidence from exhausted and discarded fluted point fragments, and a collection of rejected and damaged bifaces from four NFC sites. Discussion will address the integrity of the archaeological evidence for production stage by using multiple reduction indices, as well as an experiment re-creating NFC points using the manufacture sequence proposed. Conclusions address whether characteristics of the NFC reduction sequence can inform on the mode used to culturally transmit fluted point technology to the North.

[173] *Boundary Dynamics between Chichen Itza and Ek Balam*

Social boundaries of the past and present are usually nebulous, contested, and fluid. In this paper we examine the ancient towns and villages between the two Maya kingdoms of Chichen Itza and Ek Balam in northern Yucatam. We hypothesize that the boundary area between these two cities in the 9th century AD was based on Classic Maya concepts of ruler-centered polities but changed dramatically in the 10th century as Chichen Itza became a fundamentally different kind of Maya city the likes of which had never been seen before. As Ek Balam faded in power, smaller communities in the vicinity became tethered to Chichen Itza in a variety of ways. We focus our discussion on Ichmul de Morley, located halfway between Chichen and Ek Balam but supplement it with information from Santa Cruz, a small outlying site south of Ichmul that was the focus of our 2017 fieldwork.

[70] *The Ray Robinson Collection—A Successful Collaboration to Save Safford Basin Archaeological Artifacts*

In 1957, Arizona State Museum director Emil Haury, ranch owner Ray Claridge and geologist/avocational Ray Robinson visited the Bonito Creek site in Arizona's Safford Basin as reported by Wasley in 1962. Robinson returned to the site after that initial visit to "save" many objects that Haury did not take with him that day, along with "prospecting" other sites during the 1960s in the Safford Basin being threatened by development. For 59 years, Robinson preserved these objects along with limited provenience. Starting in 2015, at 100 years old, Robinson felt the need to ensure the objects' preservation after his death by making contact with numerous stakeholders who could help him find a "safe resting place" to "protect and keep it [the collection] together." Only through the collaboration of a diverse mix of archaeologists, anthropological departments, accredited repositories/conservation professionals, a non-profit organization and avocational volunteers, Robinson's desire became reality just months before his death and prevented the disbursement of the objects to the open retail market.

Smith, Jolene

[231] *Always Halfway There: Keeping Up with Digital Archaeological Data in Virginia*

Since being one of the first State Historic Preservation Offices to adopt electronic records management in the late '80s, the Virginia Department of Historic Resources has worked through several iterations of databases and web applications. These systems manage basic site information, details about physical collections, and now digital media and datasets themselves. Over time, the agency's priorities and objectives surrounding digital records and data have evolved in ways common to other institutions. As the most recent web GIS and database application reaches mid-life after four years, a thorough assessment of current and ideal approaches to digital data curation, preservation, and distribution is coming due as planning begins for what comes next. Building from concepts in libraries and archives, informatics, and data science, this presentation explores possible road maps.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Smith, Michele (Haffenreffer Museum of Anthropology)[277] *Moderator***Smith, Monica L. (UCLA)**[171] *Nature as Agent: Mass-Event, Incremental, and Biotic Perspectives*

The recent development of the “Anthropocene” as a distinct geologic era, added to a century’s worth of scholarly discussion about the role of humans in their ecosystems, has solidified an interpretive view of humans as prime mover. Yet nature has a “mind of its own” relative to human knowledge, action, and volition. In this session, presenters will discuss the ways in which natural entities, ranging in size from mega-storms to viruses, have presented challenging conditions to which humans can only respond. We will examine mass-event phenomena as large-scale events that are interpreted as “catastrophic” visitations on the human landscape; incremental processes of vegetation, oxidation, and material fatigue and their effects on artifacts, architecture, and agricultural landscapes; and biotic agents from disease-causing microbes to intelligent commensals, birds, and domesticated animals. As an example of the co-dependent interactions between humans and nature, the introductory paper will also consider the way in which fire as a natural occurrence has been coopted by humans to result in profound changes at every scale of interaction, from the intimacy of the domestic hearth to landscape-transforming anthropogenic fire regimes.

[80] *Discussant*[171] *Chair***Smith, Morgan (Texas A&M University)**[244] *Stuck in the Middle: A Technological Organization Study on an Underwater Paleoindian Assemblage*

Unfluted lanceolate point types in the Southeast United States, including Suwannee, Simpson, Quad, and Beaver Lake, are poorly understood. A lack of robust unfluted point assemblages found in secure context in association with radiocarbon datable material has made interpreting these types difficult. However, a few sites in the Southeast contain unfluted lanceolate points within relative stratigraphic sequences or associated with extinct fauna. Based on this evidence from these sites, these styles are often attributed to the Middle Paleoindian period (~10,600–10,200 rcybp). The Middle Paleoindian period in North America is theorized to be a time of regional specialization and settlement following a phase during which people maintained generalized, adaptable toolkits suited for high mobility. However, the rarity of discreet Middle Paleoindian components in the Southeast has made this theory difficult to test in the region. Here, I examine the only site in the Southeast at which excavations have revealed a discrete Suwannee lithic component; the Ryan-Harley site (8JE1004) in North Florida. I present a technological organization perspective from Ryan-Harley to provide insight on Suwannee point makers and to test the theory of Middle Paleoindian regional specialization by examining patterns in land-use and technological provisioning through assemblage variability and tool-kit curation.

[244] *Chair***Smith, Ryan (University of Pittsburgh) and Sarah Kennedy (University of Pittsburgh)**[190] *Minimizing Distractions and Focusing on What Matters: Using Autonomous Drone Flight Technology to Examine Architecture across the Circum-Titicaca Basin (Puno, Peru)*

Drones have tremendously influenced how archaeologists can capture data, hailed as particularly “efficient” tools for our field. Such is the case, for example, in projects which aim to produce highly detailed basemaps useful for various site-level GIS analyses. However, despite radical developments within the past few years which have significantly improved accessibility and in-field usability, an under-represented reality is the unexpected challenges these technologies almost always present in the field. As a result, drone troubleshooting often takes away valuable time from principal research objectives. This poster presents results from a macroregional investigation of late prehistoric and early colonial architectural remains (AD 1000–1700) in the circum-Titicaca Basin of southern Peru. The authors pre-programmed fully autonomous drone flight paths as a novel approach to archaeological site mapping in order to reduce the amount of time tending to drone flight. Ultimately, while autonomous flight was not without challenges, initial testing of this methodology alongside more traditional manual flying methods at several sites across the Titicaca Basin demonstrates how pre-programming flights can alleviate many in-field technical distractions and cut down on the time necessary to capture systematic and site-wide coverage, thus allowing archaeologists to turn their attention to more important observations.

Smith, Scott (Franklin & Marshall College)[264] *Ceremonial Waterscapes: The Desaguadero River Valley in Antiquity*

The Lake Titicaca Basin in the Bolivian Andes was a dynamic place that saw the development of early religious centers like Chiripa and Khonkho Wankane, the subsequent emergence and expansion of the Tiwanaku state, and the incursion of the Inca empire. The Desaguadero River is the only river that drains Lake Titicaca, flowing south and connecting the region to the central altiplano and Lake Poopó some 250 kilometers downriver. This paper examines the ceremonial and political importance of the Desaguadero River itself. I draw on excavation, survey, and remote sensing data from the sites of Iruhito, Cerro Chijcha, Simillake, and Khonkho Wankane to explore the ways that the river actively shaped the ceremonial and political lives of residents of the region throughout the pre-Columbian period, and into the early Colonial period.

Smith, Susan and Karen Adams[115] *Plant Tales from Pueblo Bonito, Room 28*

The plant record of Room 28 is filtered through a complex stratigraphy composed of early excavation backfill from adjacent rooms, Room 28 features and floor, and below to an older surface. Plant specimens from 11 macrobotanical, 7 flotation, 10 maize cob samples, and 13 pollen samples reveal an exceptionally rich record of the resources valued and used by Pueblo Bonito people. Their reliance on maize registers strongly, supplemented by a mix of native foods including pinyon nuts, cacti, cattail, and small-seeded annuals. Imported Douglas fir wood, identified from charcoal, provides perspective into Chacoan connections with regional landscapes where special resources were obtained through trade or community efforts.

Smith-Guzmán, Nicole (Smithsonian Tropical Research Institute)[260] *The Bioarchaeology of Greater Chiriquí: Challenges, Finds, and Future Directions*

Greater Chiriquí, the pre-Columbian cultural sphere encompassing western Panama and southern Costa Rica, has been subjected to intense looting activities since the mid-19th century. Nevertheless, archaeological exploration of the area to date has successfully contextualized the nature and transitions of non-perishable material culture. However, organic remains rarely survive in funerary contexts due to the high acidity of the soil, high humidity, and high precipitation in this region. Human remains almost never remain in the stone-lined tombs of Greater Chiriquí, in which one or more occupants were buried (as evidenced by the number and placement of mortuary offerings). But in shell-bearing middens along the coast, the increased soil pH from high calcium carbonate contents allows better preservation of human and animal bone. These differences in preservation have led to a sharp division in the variety and quality of mortuary information derived from coastal (lowland) and inland (highland) sites. The present study traces the few examples of human remains recovered from archaeological sites in the region and what they tell us about the cultural activities and health of pre-Columbian populations. It will highlight the case of ancient cancer found recently in a 700-year old burial from Bocas del Toro, Panama.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Smyth, Michael (The Foundation for Americas Research, Inc.)**[162]** *Preclassic Settlement Hierarchy at Xcoch in the Puuc Region of Yucatan*

Some of the earliest and largest monumental architecture in the Puuc Hills are found at the Maya center of Xcoch. Noted by John Stephens in 1841 as a large city with a deep water cave and gigantic pyramid, Xcoch is among a host of Puuc sites now dated to the Preclassic period. An interdisciplinary research program at Xcoch and vicinity from 2006 to 2013 revealed Preclassic Maya community patterns, megalithic architecture, and material culture for a developing complex society. Massive high building platforms, numerous stone pyramids and plazas, heavy stone habitation structures, and an internal site causeway connecting the large Gondola Aguada to the Xcoch grotto are among the many Preclassic settlement features extending across nearly 3 sq km. This paper examines Preclassic settlement patterns at Xcoch and its role as a regional center for the central Santa Elena plain and the greater Puuc region. Other Preclassic sites show mounting evidence for early megalithic architecture and formative ceramics supporting the presence of a multi-tiered hierarchy within Xcoch's immediate settlement orbit. These data suggest that Xcoch was a stratified society at the center of a formative regional settlement hierarchy centuries before the apogee of the world heritage site of Uxmal.

Snetsinger, Andrew (Past Recovery Archaeological Services Inc.) and Maxime Lamoureux St-Hilaire (Tulane University)**[147]** *Explaining Variability in On-Floor Assemblages: The Contextual-Behavioral Method*

Settlement abandonment studies are crucial for understanding the archaeological record, as they yield the key to decipher the context of on-floor deposits, or assemblages. We advocate the use of a behavioral-contextual method for studying on-floor assemblages for ascribing them to one of several categories of abandonment. This behavioral-contextual approach examines the vertical and horizontal architectural contexts of artifacts, the relative completeness of vessels, and the represented vessel forms in order to better understand on-floor assemblages. This method accounts for mundane and ceremonial abandonments of gradual and catastrophic nature, along with abandonment with anticipated return. The proposed method is framed in a visual model built on archaeological case-studies from across the Maya world. Most of the featured examples correspond to residential architecture, but this model should be applicable to other types of buildings. While it is far from exact, the interpretational framework that we propose allows to explain the variability of documented abandonment contexts and promises the avoidance of such equivocal terms as "problematical deposits".

Snitker, Grant (Arizona State University)**[177]** *Anthropogenic Fire and the Origins of Agricultural Landscapes during the Neolithic Period (7,700–4,500 cal. BP) in Eastern Spain*

Humans have intentionally set fires for millennia to transform the arrangement and diversity of resources within their landscapes, often altering the relationship between fire and ecosystems at multiple scales. Although scholars regularly identify human-altered fire regimes through paleoecological studies, archaeological research has not yet fully incorporated the spatial, temporal, and cultural dimensions of human-caused fire into discussions of the development of agricultural landscapes. This paper presents new, integrated research on anthropogenic fire and landscape change during the Neolithic period (7,700–4,500 cal. BP) in Eastern Spain. Using an analysis of charcoal morphology from sedimentary records, the spatial distribution of prehistoric land-use and fire across the landscape, and an ethnographic review of burning practices of small-scale agriculturalists, this project aims to better understand the socio-ecological processes that drove the pace and scale of agricultural landscape development during the Neolithic. This research builds on data and analyses from the Mediterranean Landscape Dynamics Project (MedLanD), a collaborative project between Arizona State University and the University of Valencia.

Snoddy, Anne Marie (University of Otago), Charlotte King (University of Otago), Vivien Standen (Universidad de Tarapaca), Bernardo Arriaza (Universidad de Tarapaca) and Sian Halcrow (University of Otago)**[87]** *Nutritional Stress and the Maternal-Infant Nexus: Insights from Isotopes and Paleopathology in the Ancient Chilean Atacama (ca 9000–1500 BP)*

The Atacama Desert is a remarkably marginal environment. Children are vulnerable individuals and the perinatal and weaning periods are high-risk even under ideal conditions. Investigation of stress during early life is therefore vital to the characterisation of human adaptation in this region. We compared isotopic evidence for infant diet and stress with paleopathological data to assess potential changes in maternal and infant health between the pre-agricultural Archaic Period (9000–3500 BP) and early agricultural Formative Period (3500–1500 BP). Incremental isotopic analysis (δN and δC) was conducted on 14 individuals. Results show an increase in nitrogen isotope values suggestive of maternal stress during in utero development between the Archaic and Formative Periods. Additionally, 57% of Formative Period children analysed have carbon isotope values consistent with the use of micronutrient-poor maize-based weaning foods, while Archaic period individuals appear to have been weaned onto marine resources. Paleopathological analysis of individuals from the Archaic (N = 72) and Formative (N = 115) Periods shows a significant increase ($X^2 = 6.667$; $p = .010$) in the prevalence of scurvy (vitamin C deficiency), a disease of low dietary diversity. We discuss these findings in terms of adaptive mechanisms to resource scarcity, maternity, and food allocation.

Snow, Dean (Pennsylvania State University)**[119]** *Discussant***Snow, Meradeth (University of Montana)****[97]** *Genetic Identity and Relationships in the Southwest United States and Mexico*

The prehistoric occupants of the Southwestern United States and Mexico have many similarities, including maize agriculture and the Uto-Aztecan language family. A genetic relationship, potentially due to migration between the regions, has been investigated through mitochondrial DNA analysis. However, limited modern and ancient samples, a focus on the hypervariable region of the mitogenome, and limited samples from intermediate regions between the Valley of Mexico and the cultural complexes in the Southwest US, may have masked the maternal relationship between the regions. A larger sample size from modern populations in Mexico, as well as whole mitogenomes from geographically intermediate sites such as Paquime, have allowed for a better understanding of the two regions and their relationship. An analysis of modern and ancient, as well as full mitogenomes and solely the hypervariable region, will be discussed to better understand the genetic relationship between the regions and what this means regarding expansion of cultural complexes in the past.

Snyder, Daniel (USDA-NRCS), Kathryn Whalen (SUNY Buffalo Archaeological Survey) and Douglas Perrelli (SUNY Buffalo Archaeological Survey)**[22]** *Using Debitage Analysis, MANA, and Landscape Utilization to Illuminate the Archaic-Early Woodland Transition in Western New York*

Recent CRM fieldwork in western New York by SUNY Buffalo Archaeological Survey has afforded the opportunity to address questions of how people, technology, and the environment related from newly discovered sites which span thousands of years. One of the most fruitful avenues of research is in

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

the examination of the transition from the Late and Transitional Archaic to the Early Woodland, a period in which it is suggested there was dramatic linked cultural and environmental change, where multiple competing groups gave way to the Meadowood, a culture centered on a vast network which spread trade goods, idiosyncratic objects of great social significance, and a worldview which would unite people across the Northeast. This view is supported by lithic analysis, including in-depth debitage analysis which identifies idiosyncratic patterns for cache blade production between sites, Minimum Analytical Nodule Analysis (MANA) for raw material use, as well as correlations of landscape utilization between wetland/upland setting between time periods. The transition from the Archaic to Woodland time periods in archaeological literature, initially conceived of as a simple marker between aceramic and ceramic cultures, has proven prescient for reasons which more reflect the people behind these artifacts.

[77] *The Trade of Tortoiseshell between the Caribbean and Europe during the 17th–18th Centuries: An Archaeological and Biomolecular Approach*

Tortoiseshell is made from the scutes of sea turtles; historically, hawksbill turtle was the main source of tortoiseshell but other species might have been used. Between the 17th and 18th c. tortoiseshell obtained in the Caribbean was traded on North American and European markets. Tortoiseshell was used for making combs, fans, boxes, in bookbinding, and as veneering for furniture. Excavations in European workshops (Paris and Amsterdam) attest of the use of this exotic material into luxurious items. However, archaeological fragments of tortoiseshell or artefacts have degraded, so that often the material has lost its recognizable tortoiseshell pattern, making identification to species difficult.

The carapace and plastron of sea turtles are covered with keratinous scutes mainly composed of beta-keratins, a category of structural proteins that stack together to produce β -pleated sheet structures. Here, reference materials from five species of marine turtles were characterized by proteomics analysis to build a database of beta-keratin sequences and determine robust markers for species identification. Preliminary data have shown significant differences between hawksbill and green turtles, allowing distinction of these species in ancient materials. In addition, comb fragments from archaeological sites and workshops in France were examined.

[293] *Archaeomagnetic Dating Results of PPC Project*

Archaeomagnetism is a dating technique whose application has been rising. This technique originally required burned materials, but in certain Mexican archaeological sites, volcanic products with magnetic minerals were added to the stucco mix, enhancing the geomagnetic field record and allowing us to determine it in non-burned samples. Thanks to this the number of dating events increased, improving the detail of the chronologies; a clear example of this happened in Teopancazco's neighborhood. A detailed sampling of burned and non-burned stuccos sampled between 2015(31) and 2016(33) had been processed. The dates obtained will be analyzed and compared with other previous results in order to get a greater image of the development of Teotihuacan city.

[284] *Holocene Floodplain Development of Qujiang, Zhejiang, China in the Context of Early Human Occupation of Jinhua Basin*

The Qujiang drains mountainous terrain in Zhejiang Province of east-central China. Shangshan cultures have been identified on floodplain terraces and earth mounds within the Qujiang valley. The choice of settlement in the area (10,000+ years BP) is constrained by several geographical factors, including topography, climate, access to water resources and human factors. The relationship between cultural occupation sites and river dynamics over the Holocene is poorly known in this region. Lateral and vertical river stability can be an important determinate of land use and settlement patterns. We investigate the geomorphic record of the Qujiang in relation to the Hehuashan river terrace occupation site using geophysical methods (GPR) and cores on the adjacent floodplain to infer long-term floodplain stability. Floodplain structure is dominated by shallow narrow channels comprised of basal gravels and sand (4 m depth), overlain by horizontally laminated infilled silty sands. We interpret the long-term natural channel pattern of the Qujiang to be a cobble-bedded, sandy anabranching river, subject to rapid and frequent lateral channel shifting and formation of large back-swamps during heavy flooding. This suggests poor habitat for occupation on the river's floodplain and supports settlement on the adjacent Pleistocene aged river terraces.

[299] *Excavations at the City of the Jaguar*

The Mosquitia ecosystem of NE Honduras is a critical region for understanding past patterns of socio-political development and interaction between Mesoamerica and Central America. Caches of ground stone and other objects have long been noted for the region but have never before been systematically examined. Here we report on the recent partial excavation and consolidation of one of these deposits from the newly documented city of the Jaguar, Gracias a Dios, Honduras, constituting a deposit of several hundred stone, ceramic, and other objects. We find that 1) the objects were deposited in a single episode within a cleared ritual space, 2) objects were arranged into groups representing vulture, death, and were-jaguar motifs, 3) many objects were ritually broken, 4) ceramics and other materials placed on and around the central group may represent recurring veneration at this location. The Jaguar ofrenda represents an example of ritual behavior, sacred space, and material culture that may be related to the abandonment of the city sometime in the 16th century.

[105] *Late Holocene Climate Change and the Emergence of Hunter-Gatherer Territoriality in the Late Archaic Texas Coastal Plains: An Analysis Using Bioavailable Strontium*

The Late Holocene was a time of sea level stability, increased moisture, and abundant resources. Existing models suggest that this environment set the stage for population packing and territoriality. In this presentation, strontium isotope ratios from the Loma Sandia mortuary site (2800–2600 BP) are used to evaluate the emergence of territoriality among hunter-gatherer populations on the Texas Coastal Plain. Assessing territoriality with human strontium data is facilitated by determining the strontium ratios in the local geology. While it is common to obtain strontium isotope ratios from geologic regions through plants or substrate, they tend to show heterogeneity in a given area. Strontium ratios from animal skeletal tissue, known as bioavailable strontium, are more homogenous because they provide an average of an area. I present both strontium bioavailability data from modern fauna as well as the ancient human data to illustrate how strontium ratios from diverse geological areas are a useful tool for the study of emergent hunter-gatherer territoriality in the context of Late Holocene climate.

[46] *Proceso Constructivo en los Montículos Circulares Prehispánicos de Urcuquí / Constructive Process at Prehispanic Circular Mounds of Urcuquí*

El paisaje cultural arqueológico de Urcuquí se caracteriza por la presencia de montículos artificiales circulares—Tolas—, de la época prehispánica. Sus dimensiones promedio fluctúan entre treinta y cincuenta metros de diámetro y entre dos y cuatro metros de altura.

El objetivo de esta ponencia es proponer el proceso de construcción de estas estructuras, a partir de una relectura de la información obtenida del registro arqueológico de superficie y subsuelo empleando técnicas mixtas: excavación de un perfil expuesto y prospección geofísica de otros dos. Los resultados revelaron que el proceso inició con la planificación del lugar de ubicación y el tamaño de los montículos, seguido de la preparación del terreno mediante una excavación tronco cónica, cuya profundidad dependió de la altura que los constructores deseaban alcanzar en la obra arquitectónica, para proceder a la restitución del suelo y el levantamiento de la misma. En estas dos últimas tareas utilizaron bloques de tierra cruda, elaborados con puzolanas.

Somerville, Andrew (Universidad Nacional Autónoma de México)

[125] *From Neutral to Mutual: A Long-Term Perspective on Human-Rabbit Relationships in Highland Mexico*

Studies of human-animal relationships provide insights into multiple issues relevant to archaeological research, including changes in human-environmental interactions, subsistence strategies, and socio-cultural dynamics. This presentation investigates the relationship between humans and rabbits (cottontails and jackrabbits), which were among the most commonly consumed animals in pre-Hispanic Mesoamerica. Focusing primarily on the settlement of Teotihuacan in the Basin of Mexico during the Preclassic to Historical periods (~150 BC to AD 1900), the presentation explores human-rabbit interactions through both archaeological data and stable isotope analysis of preserved rabbit bones. Temporal patterns and trends are interpreted through the lens of niche construction theory, an ecological concept that prioritizes the changes that organisms make to their environments, and the ways in which these changes feed back and influence the organisms themselves. Ultimately, this paper suggests that the ecological niche created by the urban development of Teotihuacan favored new types of relationships between the human residents and commensal rabbit species, which were mutualistically beneficial to both organisms and had implications for the local economic and social organization of the city.

[290] *Revisiting Conejo Shelter: Refining Cultural Chronologies of the Lower Pecos, Texas*

The Lower Pecos region of Texas is a remarkable study area, primarily because perishable artifacts (those made of plant materials, bone, and leather) survive in near pristine conditions in its very dry caves and rockshelters. Vaughn Bryant was among the first researchers in the region to use pollen data to build paleoclimatic and ecological chronologies from this region, his dissertation is still one of the most comprehensive analyses of this region's ecological past. Following this path, my dissertation focuses on Conejo Shelter, which Bryant also worked on in his graduate student days, back in the late 1960s. This rockshelter has a substantial, but under-studied assemblage of perishable artifacts including basketry, cordage, sandals, and coprolites. Thirty new, direct dates, using material from fiber sandals and coprolites, have formed the basis of a more fine-tuned radiocarbon chronology for Conejo Shelter. Esri ArcGIS has been used to incorporate new chronological data with information from the original excavation notes, in order to visualize the site's stratigraphy, better understand changes in the perishable assemblage through time, and track potential migrations of people and ideas between the Lower Pecos and adjacent regions.

Sonderman, Robert and Stefan Woehlke (National Park Service)

[202] *Our Sites at Risk: Climate Related Threats to NPS Administered Archeological Sites*

Over the past 15 years NPS archeological sites from Texas to Maine have faced devastating impacts from hurricanes and other climate related events. During this time, Hurricanes such as Isabel, Ivan, Katrina, Sandy and most recently Harvey and Irma have caused extensive damage to NPS archeological sites. Although not subjected to direct impacts from these recent hurricanes, National Capital Region (NCR) parks have been heavily damaged by their collateral impacts, typically in the form of flooding along the Potomac Valley. It is simply a matter of time before a major hurricane strikes right at the heart of the Nation's Capital, threatening sensitive archeological resources.

Over the past three years the National Capital Region has been gathering data and developing an assessment of park cultural resource vulnerabilities due to climate related threats to our parks. This brief presentation will discuss those threats and highlight how some NCR parks are addressing those threats.

Song, Jixiang (Sichuan University)

[336] *Prehistoric Agriculture in South Tibet: Archaeobotanical Perspective from Bangga Site*

To understand the evolution of agricultural economy in south Tibet, a large number of flotation samples and phytolith samples were collected during 2015–2017 field seasons at Bangga site. Preliminary analysis on these samples shows clues to the subsistence strategy, the nature of the site (pastoral or agropastoral) and probably the seasonality of the occupation of the site. Comparison with Changguogou site which is earlier in time indicates changes in subsistence strategy over time in this region.

[71] *Automated Qanat Detection: Examining the Application of Deep-Learning in Archaeological Remote Sensing*

This paper presents the preliminary results of a collaborative project that seeks to develop a deep learning model for automated detection of qanat shafts on CORONA Satellite Imagery. Increasing quantity of air and space-borne imagery available to archaeologists and advances in computational science has created an emerging interest in automated archaeological detection. Previous studies have applied machine learning algorithms for detection of archaeological sites and off-site features, with varying success rates. In the last few years, tremendous success has been achieved in image recognition through deep learning, a category of supervised machine learning which is based on hierarchical representation learning. We have chosen to examine the application of deep convolutional neural networks for automated archaeological detection focusing on qanats. The methodological merit of the project is that qanat shafts are one of the most suitable archaeological features for pattern recognition. The analytical merit

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

is that conducting comparative studies of qanat systems at a regional scale is predicated on mapping massive number of qanat shafts, which is impossible manually. Processing of big data generated through machine learning would allow us to examine how this sustainable water supply technology has been adapted to a remarkably wide range of water deficit environments.

Sosa Aguilar, Danny and Bernardo Archuleta

[27] *Understanding the Landscape and Material Sources through Community Partnership in Abiquiú, New Mexico*

This paper aims to discuss how the success of community partnership has led to an understanding of the way people moved across the landscape in the past. Situated in northern New Mexico, the Pueblo de Abiquiú contains a rich history that dates back at least into 2,800–4,000 BP (Before Present). Using portable x-ray fluorescence spectrometry, obsidian artifacts found at the pueblo suggests that groups are bringing obsidian from at least three known local sources. However, there is an unidentified source within the artifacts collected. Community partner, Bernardo Archuleta, is helpful and knowledgeable about the many trails and access points of the Abiquiú landscape. This reinforces a stronger interpretation of the procurement and exchange routes between the material sources and the Pueblo de Abiquiú.

[218] *"Is This A Thing?": Opportunities and Results of the Rock Art Ranch NSF-REU Program*

From 2011–2016 Dr. E. Charles Adams and Richard Lange have organized and directed the Rock Art Ranch field school, a National Science Foundation Research Experience for Undergraduates (NSF-REU) Program from 2013–2016. Rock Art Ranch, located just southeast of Winslow, Arizona contains evidence of use/occupation from Paleoindian to Pueblo periods, and yielded a wealth of data that has inspired dissertations, masters theses, senior theses, and student projects. As a participant of the NSF-REU at Rock Art Ranch, this paper highlights the opportunities this specific project with Chuck and Rich has provided, in terms of undergraduate student training in field and lab methods as well as academic research. Beginning as a participant in this program, I chose to further my academic career as a graduate student at the University of Arizona, continuing to work with data from Rock Art Ranch. My paper will conclude with a brief summary of the results of my continued participation in this project through my master's thesis on hunter-gatherer landscapes and land-uses inspired Chuck and Rich's training through the NSF-REU Program.

Soza, Danielle [153] see Zedeño, Maria Nieves

Spahr, Tim (Cape Porpoise Archaeological Partnership)

[199] *Cape Porpoise Archaeological Partnership*

The Cape Porpoise Archaeological Partnership is an alliance between the Kennebunkport Conservation Trust and the Brick Store Museum. Its purpose is to conduct archaeological study of the islands in Cape Porpoise harbor located just off the coast of Kennebunkport, Maine. Evidence suggests that Historic and Pre-Historic Period archaeological sites are present. Sea level rise due to global climate change, however, is causing shoreline erosion damaging or potentially destroying these locations. Important information of past cultures is being lost before study can begin. This is why the Trust, which owns and manages these islands, supports archaeological research. An example of this erosion can be found less than five miles southwest of Stage Island at what was previously Strawberry Island. In the 1940's, Strawberry Island was home to a working farm with farmhouse and barn. Today it is a pile of rocks completely submerged at high tide. Global sea level rise is increasing at a rate of 0.14 inches per year. This gradual increase equates to greater storm surges and conditions will worsen. Without prompt action, important information about this little-known period of history; contact between pre-Europeans and Europeans will be lost forever.

Sparenberg, Jennifer (Maryland Historical Trust)

[159] *Scylla or Charybdis? Prioritizing the Investigation of Sites Endangered by Natural Hazards*

Maryland has 8,000 miles of tidal shoreline associated with the Chesapeake Bay and its tributaries and more than 12-percent of its surface area in floodplains. These high risk areas for flooding and coastal erosion contain about 40-percent of Maryland's archeological sites and presumably many more that have yet to be discovered. It is not feasible or prudent to excavate every endangered site, thus choices about which sites to investigate must be made strategically. This paper lays out a reasoned approach to the identification and excavation of endangered sites based on: developing and refining historic/prehistoric contexts; identifying gaps in those contexts, and prioritizing which sites to survey and excavate based on context, archaeological sensitivity, and vulnerability. Other natural hazards and the effects of climate change that will impact archeological sites will also be identified, as the approach to prioritization is applicable to all hazards, and as sites are at risk to more than erosion and rising waters. Finally, ideas will be presented on how to work with non-traditional partners, like emergency managers, to communicate the risks natural hazards and climate change pose to archeological sites and why it is important to "mitigate" those risks to sites.

Sparks-Stokes, Dominique (University of Cincinnati), Susan Allen and Alan P. Sullivan III

[153] *Deposition, Disturbance, and Dumping: The Application of Archaeobotanical Measures to Taphonomic Questions*

This study assesses the utility of archaeobotanical measures to recognize differential site formation processes, drawing on the Bronze and Iron Age hill fort site of Zagorë, in northern Albania, as a case study. The blanket sampling strategy for collection of flotation samples applied by the Projekti Arkeologjik I Shkodres (PASH) (2010–2014) during the site's excavation provides a complete record of archaeobotanical changes across the depth of each excavation unit. The use of small mesh sizes for the light and heavy fractions, 0.25 and 1.00 mm respectively, allowed for the recovery of small weed seeds and chaff remains. The recovered archaeobotanical remains, all of which are carbonized, are typically well preserved and include several cereal and pulse crops, such as barley, einkorn wheat, emmer wheat, millet, lentils, bitter vetch, and peas.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Here, we compare archaeobotanical assemblages from two excavation units, one of which shows an undisturbed chronostratigraphic sequence of ceramics, and another in which ceramics from different phases are mixed. The bases for comparison are three separate volume-based density measures of archaeobotanical remains. We use statistical analysis to assess relationships between these measures and their correlation with ceramic data in each unit.

Spaulding, Britta (University at Buffalo)

[85] *Forgotten or Remembered? Rural-Urban Connections in the Modern and in the Past*

In the aftermath of the United States election in 2016, it was claimed that one reason for the outcome was that voters in rural areas were tired of being “forgotten” by the rest of the country. However, this statement is problematic in putting forth a rural-urban dichotomy that may not exist in modern times in the western world, and may have rarely existed in the past in the ways that some assert in popular media. While studying different forms of rural archaeology and landscapes, I have seen that rural forms of archaeology have often been sidelined for investigations into more “significant” urban remains. However, the archaeological record itself tends to indicate that a populace in a small farming, mining, timbering, or other rural-industrial economy is often not so very isolated, and vice-versa. Historical archaeology shows that dynamic interactions between the two “sides” mean that it is incorrect to assert strongly-drawn, almost “battle” lines between sections of society based upon where they live and work. I look at several comparative rural-urban studies, concentrating on the western world, to show that while economic activities may differ within a society, their overarching cultures, mores, and actual interactions create more cultural homogeneity than not.

[222] *Academic Jobs in Archaeology*

Over the past three decades, competition for archaeology faculty jobs at North American colleges and universities has risen significantly. Although the numbers of doctorates in anthropology has increased by approximately 70%, the numbers of new faculty positions has remained relatively constant. The present study examines academic job market trends using data derived from the 2014–2015 American Anthropological Association AnthroGuide. We identify which universities are the most successful at placing Ph.D. graduates into faculty positions by ranking each university based on their market-share trends at the decadal level. We also discuss trends in academic job placement according to gender divisions. Our findings suggest that success in landing a faculty position is largely based on where one ultimately chooses to attend graduate school.

Speal, C. Scott (State of Connecticut)

[88] *Socio-economic Class Status and Health on the Roman Danube: Skeletal Indicators and Mortuary Treatment at Late Antique Viminacium*

Cross-culturally and through time, anthropologists have found that—within hierarchical societies—elites tend to manage resources and allocate risk primarily to their own benefit. There is little reason to believe that Late Roman Imperial frontier elites would have behaved any differently. This paper examines the archaeological relationship between biological ‘stress’ or health—as inferred from skeletal remains—and socio-economic status / class—as evaluated on the basis of mortuary treatment—at the Roman frontier city of Viminacium, located on the Danube River in modern day Serbia. Mortality estimates, paleopathology, skeletal lesions, and stature data are all applied in a conjunctive approach to complicated issues of health and socio-economic class under historically known conditions of intense status hierarchy.

Spears, Michael (Anthropological Research L.L.C.) and Saul Hedquist (Anthropological Research L.L.C.)

[72] *Overview of Traditional Cultural Properties in Relation to the NHPA and Bulletin 38*

The publication of National Register Bulletin 38 in 1990 highlighted the importance of living communities to historic preservation by establishing traditional cultural properties as places eligible for inclusion in the National Register of Historic Places (Register). While the concept of traditionally important places was not new in 1990, locations important to living communities had received varied, and often minimal, consideration under the National Historic Preservation Act (NHPA). By specifying how traditional cultural properties meet the eligibility criteria for inclusion in the Register, Bulletin 38 provides important guidance for documenting how places are important to living communities. Perhaps most importantly, the identification and consideration of traditional cultural properties requires meaningful consultation and collaboration between federal agencies and traditional communities. This approach heralded changes in the 1992 amendment of the NHPA that require federal agencies to consult with Indian tribes during Section 106 undertakings, and provide an expanded role to ethnography and the ethnographer in historic preservation.

[264] *The Hills Are Filled with Water; the Caves Breathe Rain: An Ideational Landscape Approach to Settlement Distribution at Classic Period Pacbitun, Belize*

On an isolated, steep-sided hill in the otherwise undifferentiated foothills of the northern Maya Mountains is the site of Sak Pol Pak, a secondary center of the pre-Hispanic (900 BC—AD 900/1000) Maya site, Pacbitun. Sak Pol Pak is a small site encompassing the entire hilltop, with no room for agriculture and is difficult to access, yet it contains the largest pyramid-temple outside of Pacbitun’s epicenter. At the foot of the hill is the deepest, and most complex cave system in the Pacbitun area—a primary landscape drain for the region—as well as several other unrelated karst landmarks. In this paper, we analyze Sak Pol Pak from a Mesoamerican ideational landscape perspective, specifically that mountains, caves, and water were inextricably linked in thought, to propose the site was a significant ceremonial pilgrimage shrine for Pacbitun. Drawing on ethnographic, ethnohistoric and iconographic sources demonstrating mountains were believed to be living guardians of the wildland, and filled with water, while caves were mouths, exhaling aromatic, smoke-like breath, filling the skies with rain clouds, we conclude two of the primary uses of this hilltop shrine were rain and agricultural rituals.

[295] *Signs of History, Signs in History: Confronting the Past in Antiquity in the Jequetepeque Valley, Peru*

As architectural interventions on the landscape, structures considered to have ceremonial or ritual significance provide a means to regulate the temporalization of practice in material form. As built objects, monumental huaca structures in the Andes served to mark the *longue durée*, as their existence mediated and legitimized political order linked to the deep cosmological history framing mythic time, ordering the present and planning for the future. As physical and subjectified artifacts embedded in the landscape, ceremonial loci were the conceptual stages on which temporality was created,

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

preserved, and continually reaffirmed. Located only a few hundred metres apart in the Southern Jequetepeque Valley Peru, the Formative site of Jatanca and the Late Moche site of Huaca Colorada represent two occupations separated by 500 years of abandonment. Although temporally distinct and archaeologically separated as two discontinuous communities within a shared landscape, excavations of both sites have suggested that the ceremonial structures of the later Moche occupation were strongly influenced by the presence of the architectural remains of the Formative period community. This paper will trace how specific spatial and ideological concepts stretched across time between these two communities and how their situation in the landscape mediated the construction of identity and personhood.

[251] *A Twitch or a Wink: A Search for Meaning in Coins, Cuffs, and Pottery from a Rural Virginia Assemblage*

There are countless ways to interpret archaeological assemblages. One can take a purely functionalist approach. Plates are for eating and cups for drinking; fasteners keep clothing from falling. However, confronted with a range of symbolically charged artifacts from a Late Colonial through Early Republic period site in Northern Virginia, one is tempted to draw upon our anthropological origins to find meaning. A cuff link commemorating the fox hunt as well as coins and pottery bearing classical imagery. Are they simply the artifacts of everyday life in late eighteenth through early nineteenth century rural Virginia? Do they speak to the how citizens of the new republic saw themselves or what they aspired for others to see? Could the symbology represent an understanding among enslaved persons of the inherent contradiction between American bondage and American freedom? To paraphrase a legendary quote, is a cigar ever really just a cigar?

[194] *Discussant*

Sperling, Stephanie

[328] *The Pig Point Complex: 10,000 Years of Mid-Atlantic (Pre)History*

Excavations at the Pig Point site have redefined our understanding of Native American history in the Mid-Atlantic. The site is located near the freshwater-saltwater interface on the Patuxent River in Maryland, an area tremendously rich in biodiversity, and radiocarbon dates from stratified deposits at the site span more than 9000 years; however, artifacts uncovered more than two meters below surface suggest people have lived in this area far longer. Features discovered at Pig Point include a Late Woodland feasting midden, Adena-influenced mortuary pits, and several Early Archaic hearths, to name a few. Recently, archaeologists ventured outside of Pig Point in order to better understand how this significant site fits into a regional cultural landscape. Several intact and well-preserved sites were discovered that help us understand how people lived along the East Coast in the centuries before Contact.

[329] *An Emotional Challenge: What Can We Infer about Capacities for Social Emotions in Archaic Humans?*

Social emotions are central to human social lives, however whilst there has been much discussion about archaic human cognition in terms of analytical capacities, capacities in terms of social emotions are rarely discussed. A 'null hypothesis' of a lack of pro-social motivations is often assumed to be the most rational scientific perspective on how archaic humans felt towards each other. Over recent years accumulating evidence for complex social relationships in archaic humans argues against this null hypothesis however, leaving the issue of archaic human social emotions open to debate. Here we consider how to approach an understanding of capacities for social emotions in archaic species, reflecting on how social emotions are likely to have evolved and developing an evolutionary and cultural model of capacities for social emotions in archaic humans. We draw on archaeological evidence to explore what we can and can't interpret about how Neanderthals felt about each other.

Spivey-Faulkner, S. Margaret (Harvard University)

[58] *Indigenizing the Typology*

The typology is one of the archaeologist's oldest analytical tools and it pervades nearly every facet of archaeological research, whether explicitly or implicitly. Using theories of practice, ethnographic evidence of Native American classification systems, and an interdisciplinary understanding of human perception and pattern recognition, this work attempts to deconstruct and reconstruct the typology as a tool of archaeological analysis, with an eye toward creating a newly theorized typology to be used in Native North American contexts.

Sportman, Sarah P. (Archaeological and Historical Services, Inc.)

[217] *From Frontier to Farm Town: Subsistence and Diet in Old Wethersfield, Connecticut, 1636–1750*

Recent excavations at the Webb-Deane-Stevens (WDS) museum in Wethersfield, CT, resulted in the discovery of deeply-buried portions of the 17th- and early 18th-century landscapes. The stratified deposits contain a rich assemblage of domestic artifacts, personal items, architectural materials, food remains, and cultural features. The preservation of these deposits is excellent and the faunal assemblages include large and medium mammal bones, as well as small mammals, birds, fish, and eggshell. English colonists first arrived on the site in the 1630s as part of the initial Wethersfield settlement and were among the first Europeans to settle Connecticut. Incorporating the methods of ethnohistory and historical archaeology, this study examines the WDS faunal remains in the context of primary accounts of hunting, fishing, animal husbandry, and diet to shed light on the ways European settlers adapted to the Connecticut frontier and, in turn, impacted the local environment. The data also helps us to understand how English foodways and food procurement strategies evolved as the Connecticut Colony became more established in the 18th century.

[220] *A Queer Look at a Changing Vacation Landscape: Respectability and Resistance*

Using a queer lens, this research looks at respectability and resistance at a resort landscape on Lake George in New York State's Adirondack Mountains. In the late nineteenth century, this vacation resort served a mixed gender, middle-class clientele; beginning in the very early twentieth century, it has served a mixed-class, all female clientele. Respectability played a crucial role in how people navigated both of these landscapes. The flip side of respectability is resistance. Looking at artifact assemblages representing clothing, medicine, and foodways through a queer lens provides a glimpse of how respectability and resistance played out on the shores of Lake George in the 1870s-1890s and in the 1910s-1920s.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Spurr, Kimberly (Museum of Northern Arizona / Past Peoples Consulting)**[325]** *More than Just Cliff Dwellings: Results of Survey at Navajo National Monument, Arizona*

The Museum of Northern Arizona (MNA) is collaborating with the National Park Service to complete a comprehensive survey of Navajo National Monument in northern Arizona. The spectacular cliff dwellings of Keet Seel and Betatakin have been known to science since the early 1900s, but no comprehensive inventory has been conducted of the entire monument. Survey in 2016 focused on the mesa top and canyons in the vicinity of Betatakin, resulting in the discovery of two smaller contemporaneous habitation sites, two probable Archaic camps, and several historic sites related to Navajo herding and NPS infrastructure development. The probable Archaic camps are particularly significant because no sites of this age had been identified in the Monument although Archaic sites are common in the region. Survey around Inscription House resulted in the discovery of new petroglyphs and buried cultural horizons. Early in 2017, survey in the canyon surrounding Keet Seel documented several prehistoric and historic trails cut into bedrock, historic inscriptions, and two previously unknown buried sites.

St. Amand, Ani (University of Maine Climate Change Institute), Alice R. Kelley (University of Maine) and Daniel H. Sandweiss (University of Maine)**[135]** *Assessing Destruction Risk of Cultural Resources: Primary and Secondary Impacts of Climate Change on the Archaeological Record*

Coastal archaeological and historic sites increasingly face primary impacts of climate change, including sea level rise, flooding, and erosion. As cultural sites are subjected to destructive processes, action is generally limited to mitigation and salvage of immediately threatened significant sites, while their destruction by the resettlement of affected communities has been given little attention. This secondary impact of climate change threatens sites outside of the immediate zone of flooding and erosion. Given the importance of cultural heritage sites to descendent communities, and their preservation of paleoclimatic and environmental records in association with the record of human settlements over millennia, it is imperative that we develop standard methods for assessing destruction risk of archaeological sites within a climate change framework. Using Casco Bay area in Maine as a pilot study, this study develops a methodology for integrating decadal-to-centennial climate change projections, socio-economic and demographic data, and state and federal land use and cultural resource management regulations to create a robust, user-friendly risk assessment framework. The products are multi-scalar maps at the town and parcel level that can be used by communities and government officials to identify and prioritize threatened cultural resources facing destruction by secondary impacts of climate change.

Stackelbeck, Kary (University of Oklahoma), Allison Douglas (University of Oklahoma), Shawn Lambert (University of Oklahoma), Bonnie Pitblado (University of Oklahoma) and Meghan Dudley (University of Oklahoma)**[222]** *Many Pathways to Stewardship of Oklahoma's Past and Present*

True to the title of the 2017 Oklahoma Archaeology Month poster, its creation involved an extensive collaborative effort. The theme celebrates both the long-standing education and outreach efforts of the Oklahoma Archeological Survey and the founding of the Oklahoma Public Archaeology Network (OKPAN). OKPAN sponsored the competitive recruitment for an artist to conceive the poster, which generated multiple submissions and spawned other creative partnerships. The poster displays an original, innovative design that incorporates multimedia content contributed by American Indian nations, state and federal agencies, professional archaeologists, land owners, and avocationalists. With images from over 20 federally recognized Tribes, the contributions provided by indigenous communities represent a particularly poignant example of the poster's message of inclusive archaeology. The authors emerged from this process feeling like we had been part of a unique experience worth sharing with others—thus the impetus for this presentation.

Stagg, Sarah and Jason Toohey**[240]** *Rock Art and the Creation of Landscape at Callacpuma, Peru*

Numerous rock art panels dot the landscape of the Late Intermediate Period (AD 1000-AD 1450) site of Callacpuma in the Cajamarca Basin of northern Peru. The panels are comprised of many distinct motifs and types including a variety of camelids, anthropomorphs, geometric patterns and other zoomorphs. Although the iconographic information held within these motifs is certainly important, this project attempts to move beyond the iconographic significance of individual motifs or panels and examine the use of rock art to form the landscape. At Callacpuma, art is spread across large portions of the site and more than 80 panels have been surveyed and systematically recorded to date. GIS analysis is used to examine the spatial patterning of the panels, focusing on the relationship between rock art, important physical features, and elevation. Consideration is given to the spatial relationship of rock art motifs and panels and how these patterns can be used to infer the function and meanings of rock art in shaping the physical and social landscape at the site.

Stalla, David [89] see MacDonald, Brandi Lee

Staller, John (The Field Museum)**[86]** *High Altitude Maize (*Zea mays* L.) Cultivation in the Lake Titicaca Basin and Endemism*

Scientists have long maintained the upper limits of maize (*Zea mays* L.) cultivation was 3,600 masl. Archaeological evidence has documented a particular maize variety called tunqu by indigenous speaking populations, generally cultivated on terraces around the Copacabana Peninsula between 3810 to 4100 masl, in the Lake Titicaca Basin, Bolivia. This is the first known maize variety cultivated above 3600 masl. There were wide-spread landscape modifications such as raised fields and terraces geared to the cultivation of food crops by pre-Columbian civilizations of this region. Colonial accounts emphasize this high altitude maize was primarily consumed as maize beer (aqha, or chicha) and central to ritual offerings extending back to the Yaya Mama religious tradition (ca. 800 BCE). Its phenotypic characteristic are unique, unlike any other known landrace. It appears to be an endemic maize variety, unique to this part of the Titicaca Basin. Evapotranspiration around the lake reduces the diurnal variation in temperatures just enough for maize cultivation to be possible in the Bolivian altiplano. Its prehistory, cultivation, preparation and consumption among indigenous cultures are analyzed as are its botanical and biological characteristics.

[293] *Spatial Distribution of Ceramic Sherds at the Plaza of the Columns, Teotihuacan, Mexico*

During the Early Classic period (250–550 CE), Teotihuacan in what is now central Mexico was the largest city in the Western hemisphere. Occupying 76,400 m² of Teotihuacan's ceremonial center, the Plaza of the Columns, which consists of three mounds and the surrounding area, has been posited as the site of a palatial-administrative complex. The occupational history of the Plaza of the Columns is interpreted in light of a three-dimensional distribution map of ceramics, organized according to two factors: temporal phase and vessel form. Ceramic data includes over 99,000 pieces from multiple areas of the Plaza analyzed thus far, excavated during the 2015 and 2016 field seasons. Mapping the distribution of ceramic temporal phases should allow us to align the various excavation contexts chronologically and trace the usage of particular areas over time. The distribution of ceramic forms, meanwhile, can help identify the extent of household and public activities.

Stanley, Kaitlin

[50] *Bone Artifacts from Summer Bay, Unalaska*

Situated in Alaska's eastern Aleutian Islands on Unalaska Island, the Summer Bay site dates to 2,000 years BP. Over 700 osseous objects representing various manufacture and use stages have been recovered. Among these are harpoons, fish hooks, labrets, points, wedges, awls, and needles. These are primarily made from sea mammals and avifauna. Although Summer Bay represents one of the most secure dates of the Amaknak Phase (3,000 to 1,000 years BP), minimal research has been done to better understand the social organization, site function, and abundance in variation of technology. Presented here is the preliminary study from the analysis of the osseous industries of Summer Bay using the concept of chaîne opératoire. These results allow for the interpretation of the degree of recycling and rejuvenation between and within various tool types in this assemblage.

[106] *Challenges of Archaeology in the Wilderness at South Diamond Creek Pueblo*

Archaeological excavation in the wilderness is a new frontier in archaeological data collection. With most of the documented and excavated sites being outside the wilderness, usually within driving distance of a town or city, this offers an untouched and uncorrupted view of past cultures and their material remains. Most archaeology conducted in the wilderness takes the form of surveying, with little to no excavation being done. The South Diamond Creek Pueblo Project offered us one of the first opportunities to do a complete excavation in the wilderness. Through a collaboration between the U.S. Forest Service and New Mexico State University, students and volunteers were able to completely excavate and collect data from a Classic Mimbres period Pueblo. We shall discuss the entirety of the project, from its first rediscovery in modern times through the completion of excavation, including the challenges we faced while working at an archaeological site in the wilderness.

Stanton, Travis (University of California Riverside)

[177] *Maya Ceramic Technologies for Avoiding the Catastrophic Failure of Cooking Pots*

Maya potters in the towns of Muna, Mama, and Ticul have historically used a calcite crystal to temper cooking pots due to its perceived role in mitigating the negative effects of thermal shock. When a clay cooking pot begins to be used it is exposed to extreme temperature variations which lead it to experience catastrophic failure at a higher rate than many ceramic vessels used for other activities. In this paper we discuss the results of experimental archaeology using calcite crystals in thermal shock tests and compare data to tempering materials in Preclassic and Classic period ceramics from the site of Yaxuna, Yucatan.

[6] *Initial Experimental Analysis of Soft Hammer Techniques in the Maya Lowlands*

Lowland Maya lithic studies have traditionally focused on the rise of specialization at large urban centers. While many of these studies have focused on form and function of the tools produced, few focused on the technological means of tool production. Maya lithic studies have been assumed a priori to have been created using traditional means of hard-hammer and billet reduction. This paper reviews current evidence for the use of hardwoods in the production of stone tools, as well as provide an experimental comparison of debitage assemblages from Colha, an ancient Maya stone tool production site in northern Belize, and one created by myself using traditional reduction techniques and hammers crafted from tropical hardwood.

Stapleton, Charles (Northern Illinois University) and Maria Stapleton (Northern Illinois University)

[31] *Tlaloques, Tiemperos, and Trees: Cultural Models of Nature in Central Mexico*

Abundant water-related art and architecture produced by Teotihuacanos and Mexica-Aztecs in the central Mexican highlands coupled with the rhetoric of today's farmers from the same region regarding the catastrophic impacts of changes in local seasonal rainfall patterns make it clear that access to rainwater has always been a crucial factor for agricultural success in the semi-arid highlands of central Mexico, especially in communities that lack a reliable water source for irrigation. We collect a rich body of specialist knowledge regarding local understandings of relationships between animals, plants, hills, trees, humans, elements of weather, supernatural/spiritual beliefs, and farming practices that is widely shared in one such community of agriculturalists. Although this traditional knowledge has long been transmitted from generation to generation of agriculturalists, it is now in danger of permanent loss due to major shifts away from subsistence farming among the community's youth. We employed semi-structured interviews, free-listing, and experimental tasks to elicit specialists' conceptualizations of nature. Preliminary findings include a graded valuation of crops, natural and supernatural entities conceived as agentive in bringing rain, animals seen as bearers of knowledge of climatic change that humans can read, and human ability to predict and directly alter local rains and storms.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Stapleton, Maria (Northern Illinois University) and Charles Stapleton (Northern Illinois University)**[36]** *Pueblo de Indios: Syncretic Art and Architecture in the Negotiation of Indigenous Identity*

In the years immediately following the conquest of the Aztec empire by the Spanish crown, there was a period of transition in which acculturation, adaptation, and/or adoption of new configurations of political powers, religion, and social structures ushered in the Colonial period in Mexico. One of the results of the encounter between indigenous and Spanish cultures is the syncretism that developed in the art and religious architecture of this region. Studies of syncretic art in colonial Mexico primarily focus on art produced in major convents built in previous pre-Hispanic cities and/or in new towns of New Spain. However, much less is known about the small indigenous towns or pueblos de indios beyond the cities states, cabeceras or major towns. How did they respond to their new circumstances? This study reveals how Tlanalapan—a Texcoco tributary town in pre-Hispanic times, an Indian town during the Colonial period in the New Spain, and an agricultural-industrial town today in the central highlands of Mexico—not only adopts and adapts to the new circumstances, but also uses the syncretic art of a Franciscan church facade, a crucifix made of corn, and local traditions as instruments to negotiate its own identity.

Stark, Miriam, Peter Grave (University of New England (Australia)), Lisa Kealhofer (Santa Clara University), Darith Ea (APSARA National Authority (Kingdom of Cambodia)) and Boun Suy Tan (APSARA National Authority (Kingdom of Cambodia))**[175]** *Urban Economies and State "Peripheries": Angkorian Stoneware Ceramic Production and Distribution*

Angkor's agro-urban capital covered more than 60 square miles, and its landscape housed farmers and artisans. Constraints of the archaeological record limit our ability to document production scale of most activities; the genealogical skew of Angkor's epigraphic record in another reason. Yet Greater Angkor's gardens and fields must have fed residents in the Angkorian state's epicenter. Artisans built its temples, sculpted temple images, and cast metal goods; specialists and communities tended temples; and voracious elites broadcast political and religious affairs in stone and through pageantry. Some archaeologists studying the multiscale, multicentric nature of Angkorian production focus on ceramics as proxies for tracking state economy within and beyond Angkor's urban epicenter. Stoneware ceramics were neither wealth nor staple finance; their functions complemented earthenware and metal objects; and they were ubiquitous in Angkorian households across the kingdom. Kiln excavations in three discrete Angkorian subregions have produced in-situ ceramics; field projects across Cambodia offer samples from consumption sites. Our Khmer Production and Exchange Project dates stoneware kilns and uses NAA to characterize geochemical compositions of stonewares from production and consumption sites. Here we examine ceramic consumption in the Mekong Delta (Angkor's southern 'hinterland'), and its relationship to economic centralization the Angkorian capital.

Steel, Louise (University of Wales Trinity Saint David)**[117]** *Contesting Landscapes. Hidden Histories vs. Memorialised Spaces in Cyprus*

People's relationship with place plays a significant role in shaping, contesting and (re-)negotiating identities. This paper considers place as an active agent in the mediation of modern Cypriot identity against a backdrop of centuries of colonial occupation. The focus is Arediou, south of the Green Line. Here, I explore how experiences of the past are embedded spatially but are also experienced differently according to their relationship to current narratives of being (Greek-)Cypriot and memories of occupation by the colonial other.

The slipperiness of Cypriot history, how certain spaces are remembered and memorialised while others are ignored or actively forgotten, demonstrates the intangibility of the past. Different narratives are attached to different phases of the Cypriot past: antiquity is concealed within a cloak of Hellenism, while the more recent Orthodox past is revered with great pride, and the turbulent recent past is proclaimed through the very name of the local kafeneio, the Parthenon.

Drawing upon local stories passed down over the generations, I explore how places within and around the village (local archaeological sites, copper mines, residues of British colonial activity, EOKA hideouts, abandoned villages) are variously remembered, forgotten, understood and represented, to actively create a sense of being Cypriot.

Steelman, Karen (Shumla Archaeological Research & Education Center), Liam Brady (Monash University), John Bradley (Monash University) and Amanda Kearney (The University of New South Wales)**[180]** *Dating the Spirit Men: Radiocarbon Dating Saltwater Rock Art of the Yanyuwa People in Northern Australia*

Working with Yanyuwa elders, we collected seven rock painting samples for radiocarbon dating from Kamadarringabaya rock shelter on Vanderlin Island in the southwest Gulf of Carpentaria (Northern Territory). Hand motifs—prints and stencils—dominate the site, covering the shelter walls and roof, and are said by Yanyuwa to be the hands of the Namurlajanyugku spirit beings. In control experiments, negligible levels of humic acid contamination were shown to be present in the unpainted rock; therefore, no chemical pretreatment was conducted on paint or background samples. To obtain direct dates on the paintings, we oxidized organic material in paint samples using plasma oxidation followed by accelerator mass spectrometry radiocarbon dating. Radiocarbon results were averaged using the R_Combine function of the OxCal computer program with ShCal13 curve data to produce calibrated age ranges. We also conducted a mineral analysis on samples using X-ray diffraction to identify mineral pigments used in the production of motifs. This project blends scientific dating of pigment-based rock art, archaeological analysis of spatial distribution patterns of rock art styles across the landscape, and ethnography through interviews to explore how people negotiate their contemporary relationships to rock art.

Steele, Benjamin (Western Carolina University) and Ashley Schubert (University of Michigan)**[119]** *Movement and Interaction in the Appalachian Summit circa 1300–1500 CE*

The Appalachian Summit is the southernmost and highest part of the Appalachian Mountain system, extending across western North Carolina and eastern Tennessee. Beginning in the early 1300s, evidence for Mississippian practices appear within Late Pisgah phase communities in the central portion of the Appalachian Summit. These settlements include small farmsteads, palisaded villages, and sites with platform mounds. In addition to the Pisgah culture, the late Mississippian Qualla phase (1450 -1838 CE) represents the only other Mississippian society in the Appalachian Summit. These communities are contemporaneous with Late Pisgah sites to the north, sharing similar house architecture and pottery attributes. However, Qualla sites are restricted to river valleys within the southwest while Pisgah pottery is found across a much larger area of the greater southern Appalachians. These two Mississippian complexes maintained a spatial separation within areas where both pottery types are found. With cycles of more or less integration of Mississippian groups, the period of 1300–1500 CE was a complex and dynamic period of interaction and growth in the Appalachian Summit. These

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

demographic trends could be attributed to several factors, including environmental change, increased interaction with groups from neighboring regions, and increased competition for resources between neighboring communities.

Stein, Martin (Bureau of Land Management, Carlsbad Field Office) and Laura Hronec (Bureau of Land Management, Roswell Field Office, N)
[261] *Tough Love—The Permian Basin Programmatic Agreement Research Program in Southeastern New Mexico*

First implemented in 2008, the Permian Basin Programmatic Agreement (PBPA) is an alternative form of compliance with Section 106 of the National Historic Preservation Act of 1966, as amended. The PBPA allows the oil and gas industry and potash mining companies in southeastern New Mexico to contribute funding for archaeological research in lieu of requiring a class III archaeological inventory within the PBPA Area, provided they avoid recorded cultural resources. This paper describes the context in which the PBPA was developed, research completed, challenges it's encountered, and suggestions for how this kind of compensatory mitigation could be implemented in future land management elsewhere.

Steinberg, John (UMass Boston)

[167] *The Viking Age Settlement of Iceland: The Change from Migrant Society to Settled Society*

The rapid settlement of Iceland has a distinct beginning, but defining the end of the settlement turns out to be difficult. While there are anecdotal stories of earlier settlers, the beginning of large-scale migration to Iceland seems to happen in about AD 870, at the start of Harald Fairhair's reign, and the time of a distinct volcanic ash layer. The landnám, or land-grab is an important template for our understanding of movements into new landscapes, from the Neolithic Revolution, to the English Pilgrims, and the California Gold Rush. Does the migrant origin of a society define its later nature? Specifically, is the end of the landnám in Iceland reflected in one or more inflection points or is the change from migrant society to settled society imperceptible? This paper argues that by about AD 1100, the last vestiges of the Viking-Age migrant society vanished, and while the Norse themselves might not have noticed, the change seen in the archaeological record is profound.

Steinbrenner, Larry (Red Deer College)

[263] *"Across the Agua to Managua" and beyond: Getting Past Migration in Nicaraguan Prehistory*

Despite being the largest country in Central America, Nicaragua's archaeological record remains the least explored and most ignored. One consequence of this is that reconstructions of Nicaragua's prehistory have tended to rely overmuch on rather sparse (and not necessarily reliable) ethnohistoric accounts in which migration from Mesoamerican homelands is heavily emphasized, generally to the detriment of other kinds of cultural phenomena, including indigenous developments that are not explicitly "Mesoamerican". Meanwhile, only sporadic attention has been paid to the archaeological record itself, and the potential evidence that it provides for (a) actual migration and/or conquest, (b) interaction and mobility between groups within Nicaragua and beyond, and (c) multiculturalism across Greater Nicoya. This paper argues that understanding of Greater Nicoya's multicultural prehistory would benefit from approaches in which archaeological interpretations are informed but not dominated by ethnohistoric evidence—approaches that not only treat migration as a cultural phenomenon that must be demonstrated in the record rather than taken for granted but which also are capable of recognizing archaeological evidence of potential interaction between diverse groups.

Stelle, Lenville (Illinois State Archaeological Survey)

[180] *Pictographs on Artery Lake, Bloodvein River System, Extreme Northwest Ontario, Canada*

The pictographs of the Bloodvein River, Artery Lake, Ontario offer an important view of rock art design and purpose during the late prehistoric period and perhaps continuing well into the nineteenth century. All images are finger applied and utilize iron oxide based pigment. The sites appear to be of varying function. The largest and most complex consists of seven or eight panels and may reveal a narrative of healing associated with the Fourth Degree of the Midewiwin or Ojibwe Grand Medicine Society. The second appears to be a signpost indicating correct travel routing. The third consists of a substantially degraded panel and is of uncertain purpose. The iconography may be dominated by a representation of Mishipeshu (Mishibijiw) or the Underwater Panther. All three sites are subject to the forces of cryoturbation peculiar to boreal North America. Additionally, while Artery Lake is extremely remote (two weeks travel by canoe from the nearest road-head) insofar as the Bloodvein is a designated Canadian Heritage River there are a measurable number of informed visitors to the sites, many of whom are motivated to extensive photo documentation of their grand adventure. This circumstance has created uncommon difficulties for site preservation.

Stemp, W. James (Keene State College) and Jaime Awe (Northern Arizona University)

[147] *Point Counter Point: Interpreting Chipped Chert Bifaces in a Terminal Classic "Problematic Deposit" from Structure A2 at Cahal Pech, Belize*

Sixteen small chert bifaces are part of a Terminal Classic (AD 800–900) peri-abandonment "problematic deposit" recovered just above the surface near the western base of Structure A2 at the ancient Maya site of Cahal Pech, Belize. The results of stylistic, technological, and use-wear analyses performed on these chert artifacts indicate: 1) production from locally available stone; 2) five different tool styles; 3) evidence for some tool curation/re-sharpening; and 4) wear patterns on some of the artifacts that are consistent with their use as hafted stabbing or projectile weapons. Based on this evidence, as well as the other artifacts associated with them and their context of recovery, the sixteen bifaces are evaluated in terms of different processes of deposition, including midden contents, grave goods, abandonment refuse, and ritual offerings.

Stephens, Jay (School of Anthropology, University of Arizona) and David Killick (School of Anthropology, University of Arizona)

[242] *Assessing the Suitability of Southern Africa for Archaeological Provenance Studies with Lead Isotopes*

Evidence for trade between southern Africa and the Muslim world dates back to the 8th century CE. However, it is not until the 12th and 13th centuries, with the discovery of alluvial gold in southern Africa, that entanglement between the two regions intensified. As a result, state-level societies emerged and began incorporating aspects of the Muslim identity into their own culture.

With the intensification of these trade relations, craftsmen began expanding their repertoire of iron and copper metal production to include tin and bronze materials. Thus, were these new materials imported? Is this a case of technology transfer? Or perhaps an independent invention of bronze in southern Africa? We present data from chemical and lead isotopic analyses on copper and bronze objects from Bosutswe, Great Zimbabwe, Mapungubwe, Rooiberg, Thulamela, and Verwoert, as well as a lead isotopic database of sulfide ores from the region of southern Africa. Initial ore results indicate a heterogeneous array of lead isotope data, including the major prehistoric mines of Phalaborwa, Rooiberg, Copper Queen, Tsumeb, Kimberly, and Messina. Results from the analysis of metal samples are preliminary, but elaborate on the nature of intra and inter regional trade networks in prehistoric southern Africa.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Stephenson, Keith (USC Institute of Archaeology and Anthropology) and Karen Smith (University of South Carolina)**[228]** *A Retrospect of Deptford in South Carolina*

The label Deptford has long been synonymous with both a Woodland Period pottery type and a coastally oriented subsistence-residential adaptation. The former culture-historical terminology dates to 1939, while the latter concept is attributed to Milanich following his work on the Georgia coast in the early 1970s. Deptford also has been construed as a phase with a time-space-content connotation that incorporates aspects of both pottery and adaptation. Regardless of the specific meaning the term Deptford may hold, much of the foundational literature on Deptford comes from sites on the Southern Atlantic Coast, particularly those on or near the lower Savannah River. A synthesis of Deptford for the whole of South Carolina was not seen until much later, when Trinkley included Deptford in his volume on the Woodland Period in South Carolina, completed in 1990. While it seems like yesterday, it was, in fact, almost 30 years ago. What do we know now that we did not know then? How far has our understanding of this Woodland Period manifestation come? We build on the work of Trinkley and others in a reassessment of some key aspects of space and time for South Carolina Deptford.

Steponaitis, Vincas (UNC-Chapel Hill)**[291]** *The Location of the Historic Natchez Villages, Revisited*

In the 1720s the Natchez nation, as described in contemporary French accounts, consisted of at least six towns: Grand, Farine, Pomme, Tioux, Griga, and Jenzenaque. Building on the work of Andrew Albrecht, Ian Brown, and James Barnett, and taking into account eighteenth-century manuscript maps that have recently come to light, I re-examine the evidence for the nature of these towns and where they were located on the modern landscape. Apparent inconsistencies between narrative accounts and maps are reconciled by showing that the French applied different names to the same towns. Thus, the names Farine and Carnard referred to the same community, as did Grand and Valeur. Contemporary maps indicate that the layout of the civic-ceremonial capital was more complex than previously assumed.

Sternberg, Robert**[152]** *Moderator***Sterner, Katherine (University of Wisconsin-Milwaukee), Robert Ahlrichs (University of Wisconsin-Milwaukee), Dan Wendt (Minnesota Historical Society) and Larry Furo****[89]** *Testing Adaptive Efficiency: A Comparison of the Durability of Stone and Copper Projectile Points*

The Old Copper Complex represents a unique temporally and geographically bounded technological phenomenon. Binford (1962) challenged the idea that copper tools were adopted by Native Americans solely because they were technologically more efficient. He argued that Archaic copper served a primarily socio-technic function based on two assumptions. One, that copper tools were more efficient in use performance than their stone and bone counterparts. And two, that the energy expenditure required for raw material acquisition and production of copper tools was much greater than that for other material types. This socio-technic designation has formed the baseline for interpretations of the Old Copper Complex for the past 60 years. However, no one has tested these underlying assumptions about the relative economic efficiency of stone and copper tools. This study documents the experimental production and use of copper and chipped stone projectile points in order to test these assumptions.

Steussy, Clara**[39]** *Mono no Aware: Challenges of Impermanence in the Archaeological Record of a WWII Japanese American Concentration Camp*

From 1942 to 1945, the third largest city in the state of Wyoming was the Heart Mountain Relocation Center, one of ten camps where Japanese immigrants and their Japanese American descendants had been forcibly relocated from their homes along the West Coast for the duration of World War II. During their residence, the incarcerated did everything they could to make the camps their home, establishing gardens and fields, building swimming pools and root cellars, and otherwise trying to make life comfortable. After the camps were closed at the end of the war, however, they vanished from the landscape, as buildings and land were both given away to new homesteaders. In this paper, I offer a broad overview of how these involuntary settlements have both vanished from sight and yet still linger. In particular, I focus on the gardens and agricultural fields of the Heart Mountain camp, neither of which were clearly documented at the time and both of which now lie beneath active agricultural fields today. I ask what, if anything, can be done to extend our understanding of these areas, and discuss plans for continued research.

Steussy, Cally [268] see Van Alst, Emily

Stevens, Craig (American University)**[67]** *Maryland's Josiah Henson: A Tale of Black Resistance*

Josiah Henson was an escaped enslaved individual and eventual Underground Railroad conductor, yet his life story has been historically overshadowed by the fictional character he inspired in Harriet Beecher Stowe's internationally renowned novel, *Uncle Tom's Cabin*. The Maryland-National Capital Park and Planning Commission (M-NCPPC) and Montgomery Parks of southern Maryland utilizes archaeological research as one of many techniques to bring to life the narrative of Josiah Henson the individual, rather than Uncle Tom the fictional character. This paper highlights the integration of archaeological and GIS methods to facilitate the investigation of Henson's life in Rockville, Maryland and public dissemination of his narrative. As a member of this archaeological project, I created a storymap of the Riley plantation where Henson was enslaved during the early 1800's. This map introduces potential donors to the site and serves as a virtual self-guided tour for the site's upcoming museum. As Henson's influential life story is brought into mainstream understanding and made available to a broader public via technology, we are able to combat the historic belittlement of African-American achievements and contribute to the larger story of Black resistance to slavery.

[84] *New Approaches to Old Questions: Current Research Objectives for the Green River Valley Shell Midden Archaic, Kentucky, USA*
The Green River Valley Archaic shell middens (ca. 10,000 to 3000 BP) located in west-central Kentucky have a long research history dating back more than 100 years to C. B. Moore's work. Previous research programs have focused on mortuary analysis, subsistence, formation processes, and settlement patterns, laying the groundwork for future researchers to conduct more detailed analyses using newly developed methods (e.g., GIS, isotopic analysis). In this paper, we expand on previous research of the Green River Valley shell middens by describing aspects of site functions and site contents, as they relate to ecological and social contexts. This ongoing work includes 1) paleoethnobotanical research considering the scarcity of Eastern Agricultural Complex crops, either as the result of prehistoric plant use, preservation, and/or recovery strategies; 2) faunal research examining freshwater resources as paleoenvironmental indicators through species composition and isotopic analysis, and 3) GIS-based spatial analysis investigating topographic and ecological features associated with patterned re-use of shell midden locations in the Green River Valley.

[219] *The UpNorth Project: Environment Context of Late and Final Palaeolithic Dispersals*

Human mobility and environmental interactions at the end of the Palaeolithic were undoubtedly influenced by large-scale and rapid climate change. With the melting of ice sheets and expansion/contraction of ecosystems, new landscapes and resources became available to late and final Palaeolithic hunter-gatherers. The UP-NORTH project is examining the dispersal of people and animals into Northern Europe after the Last Glacial Maximum. Using a range of techniques, including stable isotopes, radiocarbon and ancient DNA analyses, UP-NORTH is exploring whether the process(es) of recolonisation and the increasing diversification seen in the lithic and bone industries during the late and final Palaeolithic represent responses to changing environments and resources, or if such changes were independent of one another. UP-NORTH is developing an integrated chronological, palaeoclimatic and palaeoecological framework to explore changing landscapes, and human activity within them. By developing multiple integrated lines of evidence the project provides an insight into the Late-glacial landscape and environment change that Palaeolithic people experienced and evaluates how these may have influenced the decisions they made, particularly in relation to their mobility.

[168] *Anthropology Is Elemental: Teaching Children Using a Four-Field Approach*

Public outreach and education are essential for the future of archaeology. While many organizations are actively involved in informing the public on the value of archaeological knowledge and the importance of preservation, the majority of in-depth education on archaeology and anthropology as a whole remains at the university level. Anthropology is Elemental is an education and outreach program that teaches four-field anthropological concepts to elementary school students through a service-learning course. This course uses applied anthropological techniques that allows graduate and undergraduate anthropology students to learn through experience while serving the community. Doctoral students serve as course instructors while guiding master's and undergraduate students as they instruct and engage with elementary pupils. Through team-teaching and interactive lesson planning, lectures and activities are developed specifically for young children, which are then made available to the public through an open access database. Assessments conducted throughout the semester gauge lesson effectiveness and indicate what concepts need to be revisited. As anthropology is rooted in the sciences and humanities, these classes convey cross-cutting concepts and encourage critical thinking at an early age. By exposing the next generation to anthropological topics, they gain an appreciation for and understanding of culture, science, and the past.

Stewart, Brian (University of Michigan)

[174] *On the Trail of Homo through Earth's High Mountains and Plateaus*

Of Earth's habitable landscapes, mountain environments present humans with some of the most striking adaptive challenges. But they also offer unique opportunities. Cross-cultural comparative research on montane hunter-gatherers in prehistory has focused on the settlement of expanses of contiguous high-elevation terrain—the world's 'high plateaus.' Yet plateau peopling represents one chapter in a much longer evolutionary story of when, how and why ancient people engaged with upland landscapes. This was a human odyssey spanning hundreds of millennia, multiple hominin taxa and continents, the world's high plateaus, but also its much more widespread high-mountain systems. To date, little effort has gone towards investigating the full variability of montane lifeways through time and space. This symposium will bring together archaeologists studying hunter-gatherer biocultural adaptations in diverse upland settings across the globe. What were the timings, motives and modes of montane exploitation, and can we elucidate the evolutionary processes by which our genus engaged with upland landscapes with increasing frequency and intensity? With these questions at the fore, this presentation introduces the session by exploring its rationale, themes and aims.

[269] *An Analysis of Biscuit Ware Ceramic Standardization in the Lower Chama Watershed, New Mexico*

The Classic period (AD 1350–1598) in the Lower Chama Watershed of New Mexico was a time of rapid population growth and coalescence. Despite these dynamic population shifts, this time remains largely understudied. In this research, I examine the social dynamics of coalescence in the Lower Chama Watershed by analyzing changes in biscuit ware production at Sapa'uinge (LA 306), the largest Classic period pueblo in the region. Biscuit ware is a locally produced whiteware common at Sapa'uinge which makes it a good proxy for local changes in production. Archaeologists have proposed that biscuit ware ceramic become more standardized over the Classic period. In this study, I use an attribute analysis to investigate changes in biscuit ware production and standardization at Sapa'uinge over the site's occupation to test if biscuit ware indeed becomes more standardized. I argue that biscuit ware does become more standardized over time and is reflective of the broader social and economic consequences of coalescence in the Lower Chama Watershed.

Stewart, Mathew (PANGEA Research Centre, University of New South Wales, Australia)

[41] *The Unexpected Fauna of Pleistocene Saudi Arabia and the Earliest Evidence of Hominin Butchery Activity*

Work in the Nefud Desert, Saudi Arabia, has been fundamental for establishing the importance of the Arabian Peninsula for Pleistocene hominin populations and their dispersals out of Africa. Recent palaeontological and archaeological exploration in the Western Nefud Desert has uncovered numerous fossiliferous palaeolake deposits and associated archaeology. Fossil assemblages include taxa with both African and Eurasian affinities and indicate a greater diversity in large mammals than resides in the region today. Furthermore, the presence of species such as *Hippopotamus* and *Alcelaphus* strongly support an ameliorated climate with expansive grasslands and large, perennial lakes. Favourable conditions likely permitted and promoted an influx of taxa, while subsequent climatic deterioration would have resulted in faunal retreat and/or extirpation. The presence of hominins in Arabia during the Pleistocene is evidenced by fossil remains, stone tools and anthropogenically modified bone, and their dispersal into Arabia was most likely tied to the establishment of favourable conditions and concomitant influx of large herbivores. This is perhaps best exemplified by the relatively diverse large mammal assemblage at Ti's al Gadah (TAG) and the accompanying evidence for anthropogenically modified bone from various fossiliferous deposits, suggesting repeated hominin dispersal events into the Western Nefud Desert during the Pleistocene.

[273] *Power as Nurture: The Inkas and Their Tiwanaku Ancestors*

Religion bonded Andean societies across centuries (Moseley 1992; Kolata 1995) and archaeologists request greater focus on religious ideologies to evaluate the Andean past (Kolata 2000; Hastorf 2007)—gaping silence in the scholarship surrounds the so-called “female, spiritual” side of society. From this hurin moiety (Rostworowski 2007; Silverblatt 1987), particulars of an overarching hegemonic strategy of power-as-nurture emerged among the Inkas (and with different details among their Tiwanaku ancestors).

Women and men colleagues from the author’s twelve years living in communities around Puno and La Paz seek to share their perspective of dynamic gender balance and daily reciprocity with spirit—held in oral narratives, ritual practices, and social organization. Imperfect compliance does not negate long-lived, fundamental principles that survived changes over time—which provide more nuanced reasoning than brute force and violent arguments as the sole origins of states.

Inkas origins of Cusco and everyone were honored in paqarina pilgrimage sites that organized the empire; local/regional domination revolved around Copacabana, Pachakamaq, and Cusco’s Qurikancha. Nurture for subjects emphasized maize production and storage. Spiritual authority that tended many emanated from Cusco and Titiqaqa, Inka and Quya. Together, these hurin features characterized much of Inka fame besides colorful warriors and golden statues.

Stoner, Edward and Geoffrey Cunyar (Western Cultural Resource Management, Inc.)

[38] *The Pequop Projectile Point Type Site in Goshute Valley, Northeastern Nevada and Implications for the Long and Short Chronology Debate in the Great Basin*

In a 1995 study of the chronological patterning of Elko Series and Split-stemmed projectile points, Bryan Hockett concluded that neither type entirely matches the patterns of the Bonneville or Lahontan Basins; and the neither area represents good chronological analogues for northeastern Nevada. Dart points recently found in the well dated context of a stratified open site in the northern Goshute Valley exhibit characteristics of both early side-notched and corner-notched types. Comparison of these points those found in Early Archaic contexts in the Bonneville Basin and other regions suggest that many of them may have been routinely misidentified as Elko Series points and not an earlier transitional point type. In this paper, we propose a new temporally diagnostic projectile point type and explore the implications that the identification of what we term “Pequop points” may have on the refinement of Great Basin chronology and on the Long and Short debate.

Stoner, Wesley (University of Arkansas)

[262] *Production and Exchange of the Earliest Ceramics in Central Mexico*

Compositional studies in central Mexico have largely focused on serving wares of the later Teotihuacan and Postclassic periods. Studies of the region’s earliest ceramics of the Formative period have been almost completely ignored. The earliest ceramics made in the region tend to be much coarser than the later serving wares, so we cannot use the existing reference databases to source them. Here we build the Formative reference database with a large sample of chemical and petrographic data generated from the earliest ceramics found in the Basin of Mexico, the Teotihuacan Valley, the Toluca Valley, western Puebla, Tlaxcala, southern Hidalgo, and eastern Morelos. We add Formative ceramics opportunistically sampled from the Soconusco, the Tehuacán Valley, and Pánuco in northern Veracruz for comparison. While the objectives of this study were not intended to highlight long-distance exchange, both regional and interregional trade of ceramics were identified. These patterns of interaction were key in producing the interregional style horizons that developed during the Early and Middle Formative periods in Mesoamerica.

[227] *The “Molecular Genetics” of Social Learning: Skill Acquisition and Individual Differences in Learning*

Although commonly glossed as social “transmission,” the acquisition of knapping skills requires extended interactions between social inputs and individual practice better termed social “reproduction.” Individual differences in learning aptitude during this process provide both the raw material for neurocognitive evolution and a potentially significant source of variability in the lithic products used to infer patterns and mechanisms of Paleolithic social learning. Here we present results from an experimental neuroarchaeology study of individual variation in handaxe-making skill acquisition. Naïve subjects received ~100 hrs training over several months, accompanied by regular behavioral, psychometric, and MRI assessments. To quantify skill, knapping performance was observed after every 10 hrs training and rated using a systematic rubric. We fit a multivariate model of artifact metrics to these ratings to derive an objective “quality” score and regressed quality scores on hours practice per subject to derive individual learning curves. The multivariate model identifies morphological correlates of knapping performance whereas parameters and values from individual learning curves can be directly compared with individual differences in brain structure and psychometric performance. Our results are an initial step toward better understanding the roles of skill acquisition and differential aptitude in generating lithic variability and shaping human neurocognitive evolution.

[157] *Settlement Pattern Analysis at the Medicinal Trail Community, Northwestern Belize: Results of Topographic Mapping from 2013-*

This poster presents the results of five field seasons of intensive survey and total station mapping at the Medicinal Trail Community, a Maya hinterland settlement in northwestern Belize. Mapping during the summer of 2017 has further refined our understanding of the size and distribution of households and numerous landscape features that have been, or continue to be, the focus of excavations. Refinements to the topographical mapping within the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

area has revealed several complex household groups associated with ridge tops, as well as an extensive network of artificial terraces, drainages and reservoirs associated with dense settlement.

Strait, Madeleine (Barnard College of Columbia University)

[259] *Skin and Bones: The Presence and Potential Implications of Dog Skinning in the Pre-Colonial Southwest*

The presence of dogs across burial sites in the southwestern United States and worldwide has been well noted in archaeological literature. The ubiquity of canine burials attests to their historical role as complex social actors in human society, prompting actions and performances, taboos and transgressions. To access the true depth of meaning in many canine remains, then, we must examine them with the level of precision normally reserved for human burials. This paper offers a close reading of the remains of four dogs buried in Room 822, a D-shaped kiva from T'aitöna (Pot Creek Pueblo). These dogs were ritually buried and show evidence of having been skinned before interment. The cultural significance of skins and dogs is analyzed in this paper through engagements with both descendant oral histories and folklore, as well as the theory of Amerindian perspectivism best known through the writings of Viveiros de Castro. When viewed through these lenses, the taphonomic evidence of skinning provides an important new understanding of the social and ritual role of dogs in the pre-colonial Southwest and argues for the importance of dogs as culturally rich participants in the human past.

Strauss, Stephanie (The University of Texas at Austin)

[128] *The Epi-Olmec Conundrum: Looking for Answers in All the Wrong Places*

Epi-Olmec is a nebulous term, adrift in both time and space. Weakly defined by a set of slippery contrasts—isolated from what came before and what comes after—the descriptor lacks robust categorization of its own. And yet in spite of this hollow terminology, the words “Epi-Olmec” themselves are so politically fraught that certain scholars have adopted the even more obfuscatory term “Isthmian”, a label growing in popularity within the literature. This paper begins the process of defining Epi-Olmec in its own right. Whether understood primarily as a time period, geographic region, visual culture program, or hieroglyphic system, Epi-Olmec art and writing have much to offer the study of early Mesoamerican material culture. Rather than setting Epi-Olmec apart from more robustly-defined predecessors, neighbors, and successors, this paper will use Epi-Olmec visual culture to inform upon them. What connections can be drawn, for example, between Epi-Olmec forms and Classic Veracruz deities? How might an understanding of Classic Veracruz iconography illuminate the complexities of Epi-Olmec supernaturals? By upending the historic practice of “reading” Epi-Olmec art through a Maya/Izapan lens, this paper will instead turn toward the west, opening a new avenue for the study and definition of Epi-Olmec visual culture.

[195] *Data Sovereignty for Indigenous Communities in the Arctic: Ensuring Ethical Control of Information and Knowledge for Indigenous Partners through Digital Tools*

The Exchange for Local Observations and Knowledge of the Arctic (ELOKA, eloka-arctic.org) partners with Indigenous communities in the Arctic to create online products that facilitate the collection, preservation, exchange, and use of local observations and Indigenous Knowledge of the Arctic.

ELOKA has created numerous digital products guided by Indigenous partners, ranging from atlases preserving and visualizing Indigenous Knowledge and information, to online databases allowing for Arctic residents to upload local observations to share among other individuals, villages, and organizations. This paper will overview various online tools, prototypes, and partnerships that demonstrate how digital tools can enable information, data, and knowledge sovereignty for Indigenous communities in the Arctic to ensure full control over their information. These efforts include extensive consultation with communities, technical strategies to restrict or open sharing based on community needs, and plans to build infrastructure to ensure community control over information. Our focus on data sovereignty ensures that deeply embedded local and Indigenous Knowledge cannot be used in ways that can bring harm to the communities and their Knowledge holders and that the communities have full control over how the information is used and shared.

[220] *Destabilizing the Planters Prospect: The Embedded Landscapes of White Creole Masculinity at an 18th-Century Plantation House in Montserrat, West Indies*

At the close of the 18th century, a planter's dwelling overlooking the Caribbean Sea on the northwest coast of Montserrat was destroyed by fire, and never reoccupied. Archaeological excavations yielded an intimate portrait of the domesticity of the British Empire materialized in fragments of everyday life. Little Bay was a small-scale sugar plantation with a physical landscape that conformed to the logic of sugar production—planting fields, sugar works, and the dwellings of the laboring enslaved. The location of the planter's dwelling, atop a high promontory, achieved the “planters ideal”, allowing for the simultaneous surveillance of the sugar works and the plantation's enslaved reinforcing the social hierarchy and control of the resident planter. The archaeology of Little Bay, bounded by context and historical contingency, provides a means to tease out the situational aspects of white Creole masculinity revealing the intersectional and relational axes of whiteness and Creole social identity that problematize the hegemonic masculine narrative inscribed in the plantation landscape. Examining the planter's house, and artifacts of hospitality and dress, this paper will explore the multi-relational entanglements of masculine social discourse embedded within the Little Bay Plantation landscape.

[183] *Documenting Association of Properties with the Underground Railroad*

Activities related to the Underground Railroad were both ephemeral and illicit. As a result, the little direct evidence that might have existed was often destroyed or hidden. How then, can the association of a property with the Underground Railroad be established, and what does it mean for a property to have integrity? Using case studies from Boone County, Kentucky, we demonstrate how the accumulation of indirect evidence can document this association and what integrity might mean for different property types such as archaeological sites, buildings, routes of travel, and river crossing locations.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Striker, Sarah (Arizona State University)[95] *Applications of Microscopy and Thin Section Petrography in Iroquoian Ceramic Analysis*

Iroquoian ceramic analysts typically focus on decorative style, in part because this approach maximizes the amount of information that can be obtained from an assemblage in a short amount of time. Decorative attributes can be rapidly identified and recorded, and a significant literature links patterns in decorative styles to social, temporal, and cultural trends. Characteristics of ceramic fabrics including clays and tempers are rarely examined, but adding these elements to the standard Iroquoian ceramic analysis would address important unanswered questions about Iroquoian ceramic production.

I present a methodology for the efficient and cost-effective analysis of Iroquoian ceramic fabrics applicable to ceramic pots and pipes. The attributes selected and methods for recording them are developed using insights from petrographic analysis of ceramic thin sections using a polarizing microscope following Whitbread's (1989) methodology. By focusing on characteristics diagnostic of specific technological and provenance related characteristics of ceramic fabrics that are evident using a standard binocular microscope, this methodology is designed to be used and refined in conjunction with selective petrographic analysis. I test my methodology by comparing this method with thin section petrography using ceramics from three ancestral Wendat village sites located near Toronto, Ontario spanning roughly 1400–1550 C.E.

Stroh Messerole, Megan (Sanford Museum and Planetarium) and Mark Anderson (Iowa Office of the State Archaeologist)[5] *Only Soil Deep: Geophysical Contributions to an Excavation at an Oneota Village in Northwest Iowa*

Data recovery excavations were conducted during 2016–2017 at the Dixon site (13WD8) a large Oneota village located along the Little Sioux River in northwest Iowa. The University of Iowa Office of the State Archaeologist contracted Megan Stroh, archaeologist at the Sanford Museum and Planetarium, to conduct geophysical surveys before initiation of Phase III excavations. A Geoscan Research FM256 fluxgate gradiometer was employed at three different mitigation locations under both pre- and post-top soil stripped conditions. Maps created from the survey data revealed both historic and prehistoric anomalies, including numerous potential prehistoric features. Excavations showed that a high percent of anticipated prehistoric anomalies were positively identified prehistoric features. This research proved invaluable for the excavators in recognizing historic disturbance, anticipating potential prehistoric features, and estimating excavation time for those prehistoric features and the surrounding areas. This research provides an excellent example of the efficacy of gradiometer survey in the loess derived soils of northwestern Iowa.

Stromberg, Kirie (UCLA Cotsen Institute of Archaeology)[309] *Shang Soundscapes*

Shang (c. 1600–1046 BCE) elites were expert manipulators of soundscape. The intimacy of the relationship between music and authority during Bronze Age China has been well established, bronze bells having served as crucial markers of status and political prestige. Before the codification of the ritual orchestra, however, and beyond the performance of “music” per se, soundscapes were defined by factors such as climate and local ecological context, by animals, by the noise of human activity at large. As early as the Shang, soundscape was a defining component of the Chinese habitus, evidenced by the prevalence of birds imagery in ornamentation as well as the rich array of noisemakers. This paper argues that Shang elites—and particularly ritual experts—wielded knowledge of local auditory contexts and utilized noisemakers such as rattles and jades in order to mediate between man, nature, and the ancestors. The resolution of natural cacophony through the orchestration of soundscape is an integral part of social evolution, or if one prefers, urban planning. Exploring Shang soundscapes is an opportunity to bridge scientific and humanistic approaches by combining analysis of the ecological record as well as man-made objects.

Stroth, Luke (University of California, San Diego), Rebekah Truhan (University of Iowa) and Jacob Foubert (University of Iowa)[89] *A Change of Hearth: Stages of Production in Hot-Rock Technology at a Late Woodland Rockshelter*

This paper applies the chaîne opératoire analytical framework to hearth maintenance behavior. There are distinct phases of production involved in creating and maintaining a hearth, as new hearthstones are introduced, exhausted, and discarded. These stages may be identified through spatial distribution of new and exhausted hearthstones. The authors argue that these stages may also be identified geochemically. We use pXRF to compare a series of experimental burnings to those from a hearth feature from the Late Woodland component of a multicomponent rockshelter. Group membership analysis had some success in distinguishing between stages of burning. When combined with spatial analysis, the distribution of new and exhausted rocks supported our hypothesis that the northern periphery of the hearth was disturbed by a previous excavation and distributed in its backdirt atop the original hearth feature.

Stroth, Luke [299] see Otto, Raquel

Stuart, David (The University of Texas at Austin) and Marc Zender (Tulane University)[337] *Epigraphy and History at La Corona*

The ancient Maya ruins of La Corona (ancient Saknikte') has an unusually large textual and historical record. The site's inscriptions, despite their highly fragmented and incomplete state, present epigraphers and archaeologists with a detailed account of a royal family that ruled there at least from the 6th to 8th centuries. Excavations in the last several years have revealed many more inscribed sculptures. This paper will focus on the distinctive characteristics of La Corona as a literate community of the Classic period, highlighting aspects of dynastic history, ritual subject matter, textual presentation, and language, all of which provide important cultural and political contexts for understanding La Corona in the wider world of the lowland Classic Maya. More broadly, we discuss the continuing emergence of a historical methodology in the theory and practice of Maya archaeology.

Stubbs, John (Peabody Museum, Harvard University)[291] *Discoveries on Campus: Archaeology in Harvard Yard*

While many may immediately associate Stephen Williams with his work and interest in the prehistory of the Lower Mississippi Valley, the historic period also caught his attention. His interests ranged from historic aboriginal groups of North America to a variety of topics and periods within historical archaeology. Williams had a notable enthusiasm and concern for the archaeology of the immediate Cambridge area and was often a first point of contact when it came to local discoveries. He took particular interest in artifacts originating from the Harvard campus and was instrumental in advocating for and establishing systematic excavations within Harvard Yard. The excavations, begun in earnest in 1986, still continue today and serve to introduce a wide range of students to the excitement of archaeological field work while advancing our understanding of Harvard's past. In addition to providing a glimpse of student and campus life through the centuries, the Harvard Yard excavations continue to yield valuable information about the location and construction of early college buildings. This paper highlights some of those discoveries.

Stull, Scott (SUNY Cortland)[89] *Experimental Archaeology of Medieval Food as Participant Observation*

Central to anthropology is the concept of participant observation, where a researcher engages in immersive learning through ethnographic fieldwork. This concept is also important for archaeologists as immersive learning provides an avenue for more robust interpretation and the development of better research questions. Participant observation is not directly possible in the study of medieval archaeology, but replication studies of food culture can serve as one avenue toward immersive learning in archaeology. Replication studies of medieval food, notably the use of medieval cookbooks and

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

replicated medieval vessels, offer insights into medieval life and everyday practice. This paper will discuss the replication and use of both cooking vessels and tableware as part of the process of immersive learning.

[286] *Making Quality Interpretations in the Ever-Expanding World of Digital Data*

Digital data collection is often efficient, cost-effective, and a tremendous accompaniment to other archaeological collection methods like excavation. Furthermore, digital data can be used to generate measurements that are simply not possible with analog data. However, as computing technology continues to become faster, more powerful, and cheaper, and the ease of collecting massive amounts of data increases, it is fair to ask: Are our abilities to analyze and interpret these data keeping up? This paper addresses this question at a time in archaeology when digital methods are more accessible than ever, and where processing data requires little more than the push of a button to run “black box” functions without really understanding the theory behind it. In turn, the interpretation of such data often takes a back seat and little is ultimately added to the anthropological understanding of a site. By refocusing efforts to use digital data the way analog data was once used (i.e., intentionally applied with full knowledge of the method and theory behind such data), archaeologists will be in a better position to use digital data that supports efficient and well-informed research.

[113] *Real and Imagined Islands: Wet Ontologies in the Neolithic of North Western Europe*

Researchers across the breadth of academia, from oceanographers to political scientists and archaeologists, have all begun to redress the critique of ‘sea-blindness’ leveled at modern society in recent years. The result has been a re-positioning of activity on the water within our accounts of human lives and thought processes—add water and stir. The results have been inspirational, controversial, and at times utterly inoperable beyond the broadest of heuristic devices, when it comes to relating them to prehistory and the questions we have as archaeologists.

In this paper we take a different tack, building an approach to both land and water that is rooted in human activity archaeological data and the imagination. Recent results from work on the land and water of the Western seaways of North-west Europe will be used to re-evaluate how we approach space, place and narrative within the context of the Neolithic.

[260] *Pre-Columbian Conflict and Early Social Complexity in Java, Southern Costa Rica*

Based on the Spanish chronicles from the Contact period (Sixteenth century), we know that the inhabitants of what is now Southern Costa Rica were in constant violent conflict, at least during the last pre-Columbian years. On the other side, warriors, captives and trophy heads are a recurrent theme in the sculptures and other artistic representations from this archaeological area. Although the importance of warfare and conflict during the pre-Columbian period has been considered in archaeological investigations in this zone, it has been always as a side topic or only a potential explanation. In this context, the site Java presents an excellent opportunity to explore the relation between warfare and the emergence of inequality. Its topographic characteristics, size and material remains indicate that it might be one of the communities engaged in conflict that the Spaniards found upon their arrival to this region. This research will evaluate the role that warfare might have played in the social dynamics at Java, by looking at indications of the relevance of conflict and social differentiation through time.

[72] *Working at Our Edges: Managing Traditional Cultural Properties in the Desert Southwest*

The most challenging work begins with federal management of these “historic properties.” The term belies that TCPs are managed not only for their physical integrity, but for their intangible, associative values vital to maintaining the contemporary identities of indigenous and other traditional communities. Consequently, rather than merely relying on determinations by agency professionals of issues related to boundaries, integrity, adverse/cumulative effects and mitigation, it becomes imperative that TCP management involve routine consultation and collaboration within the context of agency control of that federal landscape. TCP management also challenges our assumptions about what constitutes “cultural” versus “natural,” and our tacit struggle to search for scientific truth or validity within the context of religion. Overlaying and further challenging TCP management are the economic and political interests of diverse stakeholders related to the physical location of the TCP. Illustrative examples include the Colorado River Corridor below Glen Canyon Dam; Rainbow Bridge National Monument; and the Hole-in-the-Rock Trail in Southeast Utah. The power of anthropological research in facilitating understanding is discussed, along with ideas for constructive resolutions that allow for the accommodation by and human rights of indigenous and other traditional communities.

[293] *Methods of LiDAR Mapping in Urban Landscapes: Introducing the Teotihuacan LiDAR Map*

In the 1970s, systematic and expansive survey techniques enabled Million to create the first map of Teotihuacan, establishing the limits and density of the city. In this presentation we introduce a newly developed 2.5 dimensional map based on a LiDAR landscape model overlaid with a high-precision architectural map of the city drawn in AutoCAD covering 174 km² area that extends the Million map by 131 km². LiDAR technologies have greatly aided archaeological research in many landscapes with high vegetation cover by revealing ground surface detail at a quality and precision which would be difficult and highly costly to achieve with traditional ground-based survey techniques. We evaluate the perils and unique approaches to LiDAR mapping of the Teotihuacan Valley caused by both the continuous occupation and the highly urbanized landscape distinctly characteristic of the region. While this palimpsest landscape provides additional hurdles to LiDAR interpretation, it facilitates a hybrid LiDAR methodology of ground-truthing and digitizing through a fully online system.

Sugrañes, Nuria and Gustavo Neme (IANIGLA-CONICET. Grupo vinculado San Rafael)[265] *Ceramic Diversity in Hunter-Gatherers Societies from Atuel River Basin, Argentina*

Hunter-Gatherers from Southern Mendoza started to use ceramic at 2000 years BP, and it starts to diversify rapidly in each environment. Such diversity shows a contrast between highlands and lowlands typologies. According to Lagiglia, this ceramic diversity was motivated for exchange between agricultural communities from western side of Andes and northern Mendoza.

In this poster, we present new ceramic information from six archaeological sites located in the Atuel river basin. This information combines distributional, technological and, neutron activation analysis, which's sustain that local types, as Overo/Nihuil, Atuel/Arbolito and Atuel Cepillado, are more homogenous than was previously proposed. The observed ceramic diversity only increase ca. 1000 years BP with the introduction of foreign types as Lolloe, Aconcagua, Viluco and Agrelo types, but in a lower quantities. Finally, the lowlands assemblages are more diverse than those located in the highlands.

Sullivan, Elaine (UC Santa Cruz)[320] *Moderator***Sullivan, Kelsey (University of Oregon), Britton L. Shepardson (Northern Arizona University), Mario Tuki (Museo Antropológico Padre Sebastián Englert), Paula Valenzuela Contreras (Museo Antropológico Padre Sebastián Englert) and Francisco Torres Hochstetter (Museo Antropológico Padre Sebastián Englert)**[101] *Education, Conservation, and Research on Easter Island through Three-Dimensional Photogrammetry*

For fifteen years, Terevaka Archaeological Outreach (TAO) has provided local students from Rapa Nui (Easter Island, Chile) with hands-on experience to: (1) offer experiential learning opportunities about the local cultural and natural resources; (2) promote awareness and expertise in conservation measures and sustainable development; and (3) document and study the modern and ancient natural and cultural resources of the island. Three-dimensional ortho-corrected photogrammetry (3D OCP) is a valuable technology within archaeology, which is relatively cheap and accessible. Digital and physical models produced through 3D OCP serve as powerful educational tools, making cultural heritage more accessible to a range of interested parties, especially the local community.

Students who participated in the 2016 and 2017 TAO seasons photographed hundreds of artifacts at the island's only museum (Museo Antropológico Padre Sebastián Englert), as well as archaeological features and sites located across the landscape. TAO students are now using 3D OCP to create a collection of digital and physical 3D replicas on the island—for educational, conservation, and research purposes—accessible to the local community members, the tourism industry, and archaeologists. This research conveys the potential for archaeologists to help empower local communities, as well as enhance archaeological research potential through non-destruction, cutting-edge technology.

Sullivan, Lauren (University of Massachusetts), David Hyde (Western State University of Colorado), Robin Robertson (CATS, The University of Texas at Austin), Palma Buttles (Carnegie Mellon University, SEI) and Fred Valdez (The University of Texas at Austin)[243] *Material Culture and Chronology at Colha, Belize: Recent Findings and Future Directions*

Lithics, ceramics, and other artifacts, recovered from the 2017 Colha, Belize field season, are utilized to gain insight into chronological developments and changes at the ancient Maya site. Maya material culture recovered from excavations at Colha are presented and interpreted by context. Each artifact category is briefly defined, described, and placed into a general site context. The estimated time range for the recovered material culture extends from the Late Archaic to the Late Preclassic. While findings may be preliminary for several artifact classes, the current interpretations allow for useful and comparative research needs.

Sullivan, Lynne (University of Tennessee) and Kevin Smith (Middle Tennessee State University)[119] *Heading for the Hills: The Middle Cumberland Region to Upper Tennessee Valley Migration*

By 1300 CE, the people of the Middle Cumberland region were on the move, a migration related at least in part to climatic instability including multiple drought episodes. Numerous types of evidence suggest that some of these migrants went to East Tennessee. We discuss possible material culture evidence for this migration from several East Tennessee sites, but with an emphasis on the Long Island site, now located in the Tennessee Valley Authority's Watts Bar reservoir and near the base of the Cumberland Plateau. Excavations at the site by the Smithsonian in the late nineteenth century recovered a Middle Cumberland-style statue from a platform mound. Excavations in 1941, by Works Progress Administration crews supervised by University of Tennessee archaeologists, recovered pottery samples with some Middle Cumberland characteristics from three platform mounds and a large wall-trench structure near these mounds. Our study of the statue, pottery, and related artifacts and features from Long Island provides insights to the nature of the Middle Cumberland influence at this site and potentially at other sites in the region.

Sullivan, Lynne [286] see Lowry, Sarah

Sullivan, Vanessa[239] *Sinking into the Maritime Archaeology of the Ocean State: The Use of GIS to Analyze Rhode Island's Submerged Archaeological Sensitivity*

GIS has become a widely utilized tool for analyzing archaeological sensitivity. The state of Rhode Island has more documented shipwrecks per square mile than any other, making it an ideal place to develop an archaeological sensitivity model for submerged sites. In 2008, the Beavertail Lighthouse Museum Association started compiling a shipwreck database. The Rhode Island Historical Preservation and Heritage Commission has incorporated the database findings, documented submerged archaeological sites, and other data-sets into GIS so that information can be analyzed in a spatial manner.

Over 1,000 shipwrecks have been identified as a "total loss" and may prove to have archaeological remains present. More than 650 other documented wrecking events do not have enough information to determine if remains are likely, but with further research may prove significant. Integration of GIS data with the known shipwreck sites aims to advance knowledge of the Rhode Island submerged maritime landscape, which will ultimately assist in mitigation efforts during future development undertakings. This project investigates both the advantages and limitations of utilizing an archaeological sensitivity model for submerged cultural materials, and questions the opportunities and restrictions of a GIS based approach for analyzing shipwreck sites.

[97] *Microbial Communities from Soil and Coprolites*

With implications involving health, nutrition, and even behavior, research into the human microbiome is a burgeoning field within the biological sciences. Less well understood is whether humans, both modern and past, share(d) a recognizable core microbiome. Archaeological materials represent a window into microbiome structure and function of ancient peoples. Assuming microorganisms or their DNA persist for many years under optimal conditions, coprolites should represent time capsules into the distal gut microbiome of ancient people; potentially providing information concerning subsistence practices and health. A vital step towards understanding how such information presents in the archaeological record would be the capacity to recognize and differentiate ancient microbiome constituents against potential contaminants, especially from soil. To test this, we performed parallel microbial 16S rRNA gene surveys using DNA extracted from co-located cave soil and coprolite samples. To verify that microbial DNA is distinct between the two sample types, principal coordinate analysis was applied to rRNA gene libraries from both. Microbial genera associated with modern humans were also tracked. Differentiation of coprolite microbial communities from those of native soil will increase our confidence that detected microbial communities are indeed derived from ancient peoples; an approach that will be applicable to other locales.

[284] *The Source of the Hemudu Culture and Environmental Change during the Early-Middle Holocene: New Evidence from the Jingtoushan Site, Yuyao, East China*

The source of the Hemudu Culture has remained a key issue for more than 40 years. Recently, the coring survey at the Jingtoushan site has provided a chance to promote our understanding of this issue. Its cultural deposits are deeper than those of any other prehistoric site along the coastline of East China. It is overlain by Late Holocene marine deposits of 6 meters deep. Twenty radiocarbon dates, along with the particular depth of midden deposits and pottery sherds, indicate that the site dates to 8,000 BP, much earlier than most shell middens that have been uncovered in China. It is considered to be related to the source of the Hemudu Culture. The preservation and richness of organic materials are extraordinary. This site has great potential for understanding environment changes and sea level rise in the coastal area of East China since 10,000 years ago, as well as the interactions between human societies and environment.

Sun, Yufeng (Washington University in St. Louis)

[336] *Crop Processing in the Lower Yellow River Valley: From Known to Unknown*

As one of the most highly-developed cultural regions in China, many aspects of the lower Yellow River Valley have been systematically studied, including climatic revolutions, cultural patterns, and subsistence strategies, among others. It is now known that the diversified environments of the Valley, including flood plains, hills and coastal regions, facilitated the development of distinctive cultures and subsistence patterns in these areas. These distinctions are principally reflected in their production and processing of crops. In this paper, I will provide an overview of precedent-setting paleoethnobotanical studies in the Valley, and then place them into a framework of climatic and settlement pattern revolution. By analyzing the food structure, spatial distribution of crops, and the ways groups harvested and processed food, I will put forward a model of crop processing in the prehistoric Yellow River Valley, which may then provide a pathway to understand human adaptations and social complexity in this context.

Sunell, Scott (UCLA)

[186] *Cultural Dimensions of Toolstone Variability in the Santa Barbara Channel Region, California*

The Santa Barbara Channel region of southern California lacks reliable sources of high quality toolstone except in a few prominent locations. The nearest obsidian sources are hundreds of miles away, and local chert can be highly variable in quality and availability. Monterey chert, common to both the northern Channel Islands and the adjacent mainland, varies widely in terms of inclusions, color, and consistency; Franciscan chert from the mainland is similarly troublesome for tool-makers on a large scale. In spite of this, the Chumash and their ancestors utilized these materials for more than 10 millennia to manufacture finely worked bifaces; late in prehistory they also developed sophisticated specialized microlithic tools for shell bead production. Most research in the region has focused on these craft products while omitting the critical role played by widely available but poor quality toolstone. I evaluate the use of low quality local materials in this context, arguing that patterns of lithic production on Santa Cruz Island responded more strongly to cultural norms than to the functional properties of specific toolstones. While the intrinsic properties of given materials may have set the stage for later innovations, by the first millennium AD chert was more than just good stone.

[97] *Ancient DNA Analysis from Micro-fractures in Bridge River Stone Tools*

There has been little research specifically designed to examine variability in how the porosity of lithic raw materials and micro-fractures from use-wear create environments that trap and preserve residues containing DNA on lithic tools. This study examines lithic tools made from a variety of raw materials to assess the effects of variability of raw material type, use-wear, and damage on preservation of ancient DNA (aDNA). aDNA analysis of stone tools can begin to address if the tools were used to process specific species of animals. The ancient lithics used in the study were from the Bridge River Excavation site in the Middle Fraser Canyon, British Columbia. The site was occupied periodically from 1800 years ago to the mid-19th century (Prentiss et al. 2008). The protocol to extract and amplify aDNA locked in micro-cracks on the surface of tools involved treating them with chemicals and sonication (Shanks et al. 2005). Bridge River researchers have designated the tools as used in "food processing or tool manufacturing" (Prentiss 2014), and our analyses had potential to connect the tools with specific species such as elk or deer (as well as *Puma concolor*, and *Canis lupus familiaris*), and provide an interesting new avenue of investigation.

Supernant, Kisha (University of Alberta, Department of Anthropology)

[205] *Heritage, Healing, and Coming Home: An Archaeologist Encounters Her Ancestors*

Archaeologists in the Americas rarely study their own history; rather, the bulk of archaeology in this region is done on Indigenous histories. Non-Indigenous archaeologists studying Indigenous history can contribute to the erasure of Indigenous peoples from the accounting of their own past by centering the scientific study of material culture as the best or only way of knowing the truth. So what happens when an Indigenous archaeologist encounters her own ancestors in the archaeological record? In this paper, I explore how archaeology and cultural heritage help me to face and heal the intergenerational trauma of my Métis family, both on a personal and community level. The history of the Métis Nation in Canada has rarely been examined in the archaeological record and, for many decades, Canada attempted to erase Métis identity. In light of Métis resurgence, I argue for the important role archaeology can play in helping us reclaim our rights and recognition. In this context, archaeology can fill in the silences and erasures of history, bringing disconnected Métis people home to their heritage in tangible ways.

[205] *Traumasces: Progress and the Erasure of the Past*

Urban landscapes, those densely populated spaces in which generations of people live, play, work, and die, are complex palimpsest of memories. But not all memories are treated the same or are even chosen to be remembered. My own experiences as an archaeologist living in a modest-sized, rust-belt city for nearly two decades has exposed the never-ending rush of “progress” to erase the past. At both my research sites and my home, I see communities harmed by the trauma of forced erasure of the past—forced forgetting. As landmarks, parks, homesteads, and factories that were once the backdrop of many people’s lives are destroyed, communities experience the disorientation and dislocation of memory. The demolition of the past is usually coated with a veneer of newness and the promise of better times ahead. But what trauma becomes embedded in the landscape once communities lose their physical connection to their past and their identities? What burdens are placed on those who are left to do the work of remembering? I propose that “traumasces” are created in the violence of gentrification. Heritage practitioners interested in social justice must consider the traumatic effects of uncritical economic development.

[124] *Gender and Space in Campsites of Dukha Reindeer Herders*

The division of labor by sex and gender among small-scale societies is well known, but how differences in gender roles are reflected in variation in human spatial behavior has received considerably less attention. Understanding how and why individuals of different gender use space is critical to the development of middle range theory linking gendered human behavior to its archaeological correlates. Over five field seasons, we have collected data on the spatial distribution of people and activities within the interior and exterior spaces of campsites of nomadic Dukha reindeer herders in Khövsgöl Province, Mongolia. In all, our sample includes more than 20,000 high precision spatial data points collected by observational mapping and photogrammetry. In this paper, we examine how cultural models, division of labor, and other factors structure the distributions of male and female activities in Dukha camps. We end with a discussion of the relevance of our findings for archaeological gender studies.

Sutherland, Kenneth (Louisiana State University) and David Chicoine (Louisiana State University)

[265] *Volumetric Analysis of Neckless Jars and Bottles in Early Horizon Nepeña, Peru*

This contribution explores feasting practices discernible from the pottery assemblage at three Early Horizon archaeological complexes in the lower Nepeña Valley, north-central coast of Peru: Caylán (800—1 BCE), a large town or city interpreted as the primary center of a multi-tiered polity; Samanco (500—1 BCE), a small coastal town involved in production and exchange of maritime resources; and Huambacho (600—200 BCE), a ceremonial center associated with agricultural production. In feasting related studies, archaeologists tend to focus on qualitative issues while quantitative issues remain understudied. Questions regarding how much beer was brewed, how much stew was served, and the relative scales of food preparation within family and household contexts compared to public feasting contexts need to be addressed. This poster reviews ceramic assemblages from different compounds at Caylán, Huambacho, and Samanco, comparing vessels used for production and consumption of foods and beverages in both public and residential areas. Particular attention is given to bottles as consumption vessels and to ollas sin cuello, or neckless jars, as production vessels. Variations in the volumetric capacities of vessels between compounds within a site and between compounds at different sites enlighten on the sociopolitical importance of feasting events.

Sutter, Richard (Indiana University-Purdue University Fort Wayne)

[249] *Variability among the Dead: Population Structure and Inferred Cultural Adaptations to the Changing Environmental and Sociopolitical Landscapes during the Late Moche (AD 650–800) Era in the Jequetepeque Valley, Peru*

Recent bioarchaeological and archaeological research regarding the environmentally influenced demise of the Moche (AD 200—800) of the Jequetepeque Valley, Perú, indicates a variety of responses, including population dispersals, political fragmentation, cultural hybridization, and new political alliances with recently arrived foreigners at ceremonial centers. Biodistance analyses suggest that adjacent highland Cajamarca peoples from the adjacent highlands arrived in the Jequetepeque and likely interbred with local inhabitants interred at San José de Moro during both the Late Moche (~AD 650–800) and subsequent Transitional (~AD 800–900) periods. Local ceramicists at San José de Moro responded by experimenting with hybrid vessels that blended both local Moche forms and designs with new ones brought by highland immigrants in a process that Kolata has referred to as orthopraxy. These data speak to social and political relationships that existed between the arrival of foreign Cajamarca and local Moche during this period of dramatic change.

Sutton, Wendy (USDA Forest Service, Gila NF)

[106] *The Gila Wilderness: Defining, Redefining, and Managing Our First Wilderness Area*

In 1924 the Gila Wilderness was established. Ideas of what wilderness is have changed since then, particularly with the passage of the Wilderness Act in 1964. On the Gila National Forest these changes are reflected in changing wilderness boundaries and management strategies. Wilderness boundaries were re-drawn to exclude man-made features, some constructed by the CCC after designation. Historic and prehistoric sites associated with the wilderness, both within and immediately outside of it (and their management through time), are physical manifestations of the national dialogue about what wilderness means to us.

[251] *Hidden beneath the Asphalt: Urban Archaeology in Parking Lots*

Historic maps provide tangible visual evidence of how cities evolve over time. Buildings are erected and demolished, roads are constructed, and streams are diverted or filled. To an untrained eye, the built environment of a typical city block may look like an unlikely place to find archaeological remains but to an archaeologist it is a time capsule waiting to be opened. To this end, urban archaeology often requires peeking beneath parking lots, which often provide temporary protection to buried resources until the land is slated for development. The changing dynamics of an evolving city may

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

mean that beneath the parking lot archaeological resources are buried beneath extensive fill deposits. Conversely, they may have been destroyed by extensive grading. Consulting historic maps, conducting elevation change analyses, and conducting geophysical testing can provide an idea of what is buried below, but ultimately excavation is required to determine what survives. This paper will discuss several urban archaeological sites found beneath parking lots in DC, Maryland, and Virginia.

[146] *Reconfiguring Social Networks: The Emergence of Social Complexity before and after Urbanism on Cyprus*

Despite the lack of cities, the Prehistoric Bronze Age on Cyprus (2400–1700 cal BC), an island in the Eastern Mediterranean, witnesses high wealth inequality and spatiotemporal variation in the emergence of social complexity or hierarchical social networks. Previous research has shown that social networks are malleable and cycle between egalitarian and hierarchical in different facets of complexity (control of labor, access to resources, participation in trade networks) through the Prehistoric Bronze Age as social actors renegotiate their social and economic worlds. What remains unknown is whether cycling social networks are a phenomenon present only in pre-urban societies or if this social malleability continues after urbanization. To compare these processes, methods derived from small world network analysis and modern economics are used to explore the changes in and stability of social networks and wealth inequality as cities first emerge on Cyprus during the Protohistoric Bronze Age (1700–1200 cal BC).

[24] *Sustainability and Tradition in Anindo Village, Okinawa, Japan*

A recent collaborative effort by Japanese and American archaeologists and environmental scientists identified and examined the historic (ca. 1897-late 1950s) Anindo Village. Located within the stream valleys and mountainous uplands of the Kanna Watershed in central Okinawa, Japan, Anindo Village was a short-lived reclaimed land settlement dependent on both agricultural and forestry-based economic practices. This paper examines the distribution of archaeological sites and the natural and cultural landscapes related to this historic settlement. Ethnographic research with descendant communities enhanced our interpretation of cultural practices in Kindai Period (AD 1879–1945) settlements. Our investigations provide a context to a wide variety of sites, including household and farmstead remains, agricultural farming fields and complexes, habitation terraces, a cemetery and tombs, and World War II evacuation tunnel shelters. Charcoal kilns, used by the villagers for supplemental income, were also identified throughout many of the surrounding stream valleys. Ethnobotanical analysis in the environs of Anindo Village indicates intensive arboriculture, as well as the cultivation of non-arboreal plants. In addition, traditional cultural practices demonstrated at the Anindo Village sites reflect an ethos of sustainability in line with official Imperial Japan directives as well as local (prefectural) forestry society guidelines.

Swenson, Edward (University of Toronto)

[216] *Gender Complementarities and the Construction of Late Moche Political Landscapes*

Recent investigations at the Late Moche center of Huaca Colorado in the southern Jequetepeque Valleys suggests that gender complementarity constituted an overarching principle that underwrote Late Moche conceptions of ecology, cosmos, political authority, and the power of sacred places. The dualistic layout of the huaca's ceremonial nucleus resonates with general Andean philosophies that moral order was founded on the balanced if dialectical interdependence of male and female forces. However, an investigation of the ritual practices of the center along with the spatial differentiation of gender-specific activities within the larger site reveals some of the distinguishing features of Late Moche ideologies of sex and complementarity. Ideals of male, female, and their union (yanatin) were spatially inscribed and appear to have formed the common denominator of a whole series of complementary oppositions, including production and consumption, life and death, senior and junior, day and night, highland and lowlands, and possibly sky and earth. In the end, the data suggest that gender identity was not so much determined by biological sex but by the activities and rituals performed by cooperating groups at Huaca Colorado.

Swift, Jillian (Max Planck Institute for the Science of Human History)

[125] *Getting to Know the Neighbors: Commensal Insights into Human-Ecosystem Dynamics*

Advances in zooarchaeological method and theory, increased attention to the recovery and analysis of microfaunal remains, and multidisciplinary collaborative research have generated increasingly nuanced understandings of past human-animal relationships. This paper provides a brief introduction to archaeological investigations of commensal fauna, highlighting the myriad ways that research focused on the commensal niche sheds new light on past societies and ecosystems. A case study from Makangale Cave (Pango la kijiji Makangale), Pemba Island, Zanzibar illustrates the utility of small commensal fauna for understanding processes of human niche construction and paleoecological transformations. Stable carbon and nitrogen isotope data derived from the human-transported, omnivorous black rat (*Rattus rattus*) and house mouse (*Mus musculus*) reflect changes in nutrient flows throughout anthropogenic food webs, as well as resource partitioning between two species occupying the human niche. Explicit focus on these often-ignored commensal taxa provides new tools for investigating human-environment dynamics in the past.

[334] *Investigations at the James Hatch Site and the Houserville Archaeological National Register District, Centre County, Pennsylvania: The Benefits of Collaboration between Institutes of Higher Learning and Government Agencies*

In 2017, the coupling of a Federally funded transportation project with an undergraduate archaeological field school, and Applied Archaeology thesis research, produced an innovative approach to archaeological mitigation. The project funded a Phase III investigation of a lithic workshop site—the James W. Hatch Site. The site was occupied during the Early Archaic Period, and attracted occupations focused on jasper reduction at a location 1.2 kilometers from a quarry. The site produced over 9,000 prehistoric artifacts from contiguous block excavation. Another part of the federally funded project included the synthesis of survey data from sites surrounding the jasper quarry, and helped re-evaluate and map the boundaries of the Houserville National Register Archaeological District. The reevaluation of the district will help guide the management of sites affected by future infrastructure projects for many years to come. This project serves as an example of an innovative and cost-effective alternative mitigation solution providing valuable experiential learning opportunities to students and young professionals while effectively managing cultural resources.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Swogger, John (Archaeological Illustrator)**[108]** *Genuine Reproductions: Ethics, Practicalities and Problems in Creating a Replica of a Zemi from Carriacou*

When is a copy not a fake?

In 2014, the Carriacou Archaeology Project (University of Oregon; University of London) excavated a unique stone zemi at the Grand Bay site on the island of Carriacou, Grenada. The decision was made to create casts of the zemi in order to facilitate simultaneous display of the object in multiple island museums. It was hoped this would allow both museums to advocate the small island of Carriacou as a site of particular archaeological significance, to stimulate scientific tourism and promote the research potential of the island to post-graduates.

However, the making of the casts has raised some potentially problematic issues. The original intention was that the museums would display the casts correctly labelled as copies. This has not happened, raising the question as to whether or not the casts are moving from being mere “replicas” to being fakes: copies which deceive—however unintentionally or benignly. And because the casts increase the “visibility” of the original they are adding new layers of economic and aesthetic value to the original—with potential implications for theft, forgery and looting.

Swope, Karen K. [261] see Barnes, James

Sykes, Naomi (University of Nottingham), Greger Larson (University of Oxford), Carly Ameen (University of Liverpool), Philip Shaw (University of Leicester) and Tom Fowler (University of Nottingham)**[217]** *The Easter E.g.—Changing Perceptions of Cultural and Biological “Aliens”*

Human immigration and biological invasions are high-profile topics in modern politics but neither are modern phenomena. Migrations of people, animals and ideas were widespread in antiquity and these are frequently incorporated into expressions of cultural identity. However, the more recent the migrations, the more negative modern attitudes are towards them. In general, native is perceived as positive and ‘natural’, whereas the term ‘alien’ is attached negatively to cultural and environmental problems. This paper will explore these value-judgements through the example of Easter, the most important event in the Christian calendar.

The Easter festival and its associated animals—namely the brown hare, rabbit and chicken—are all ‘alien’ to most of the areas in where Easter is celebrated. This paper will focus on the integrated use of scientific approaches (genetics, GMM and isotopes) with evidence from traditional (zoo)archaeology, art history, and historical linguistics to investigate the human-mediated dispersal of the brown hare and rabbit in connection with the Easter cult. It will argue that the cultural and temporal context of these ‘alien’ introductions are key factors for both understanding the origins of Easter and challenging widespread negative attitudes towards cultural and biological ‘aliens’.

Synsteliën, Jennifer (University of Tennessee, Chattanooga) and Heli Maijanen (University of Oulu)**[90]** *Bone Modification by the American Cockroach*

Bone modifications by chewing insects and their larvae have been described for several families. We report extensive bone damage due to feeding of the American cockroach (*Periplaneta americana*), a close relative of termites. Roaches were seen feeding on thawing vertebrate remains in a processing room, in which skeletons were being prepared for entry into a comparative collection. A study of roach gnawing was initiated after a number of defleshed mammal bones were discovered extensively modified. Six human skeletons that were similarly processed in a neighboring suite were also surveyed for insect damage. Gnaw marks were examined under a stereomicroscope using 10–40x magnification. A feeding experiment with housed roaches demonstrated this insect’s ability to modify bone. Locations of extensive roach feeding appeared superficially similar to small rodent gnawing, but the two agents were clearly separable under low magnification. Roach mandibular scrapings and their patterns were similar to those previously reported for termites. This study shows the widely distributed American cockroach can and will modify thin cortical bone and underlying trabeculae; and suggests this highly omnivorous species favors soft tissue and bone lipids. Significantly, roaches are potential agents of bone modification of vertebrate carcasses that decay in subaerial or shallow burials.

Szabo, Vicki [16] see Frasier, Brenna

Szapak, Paul (Trent University)**[50]** *The Environmental Context of the Dorset-Thule Transition: Evidence from Stable Isotope Analysis of Archaeofauna*

Stable carbon and nitrogen isotope analyses of fauna from archaeological sites in the Central Canadian Arctic Archipelago were performed to examine the environmental context of the Dorset-Thule transition. Isotopic data from a large number of ringed seals demonstrate that there was a reduction in the importance of primary production derived from sea ice-associated algae during the Thule occupation relative to the earlier Dorset occupation; these data are consistent with an increase in open water conditions at this time. Arctic foxes from Thule sites consumed significantly more marine protein than those from Late Dorset sites, which would have been obtained from scavenged marine mammals killed by humans and polar bears. This shift was most likely driven by the deposition of bowhead whale carcasses on the landscape by the Thule, which altered the foraging ecology of the Arctic fox.

[315] *Discussant***Szremski, Kasia (University of Illinois)****[65]** *Alternative Complexities in the Central Andes: An Anarchist Approach to Chancay Political Organization in the Huanangue Valley*

Understanding the political organization of Late Intermediate Period (1000–1470 CE) societies along the central coast of Peru has remained challenging. The urban/proto-urban settlements that are characteristic of groups like the Chancay, Ichma, and the Chinca (among others) have been interpreted as material manifestations of elite power, however, many of these societies don’t fit traditional models of chiefdoms or states. Using a combination of ethnohistoric data, settlement pattern analysis, and excavation data, this presentation draws from recent trends in anarchist theory to explore the applicability of “horizontal-complexity” models for some LIP Andean societies. This paper examines the case of the Chancay, who which rose to prominence on the north-central coast of Peru between 900–1532 CE. Specifically, this paper explores the relationship between two Chancay sites in the Huanangue Valley, Cerro Blanco and Salitre, to argue that the Chancay complexity may have developed out of a resource sharing system that was created as part of a local level responses to environmental challenges. As a result, the Chancay polity may be better understood as a horizontal network of loosely affiliated nodes bound together by principals of mutual aid instead of as a centrally organized chiefdom or state.

Szymanski, Ryan (Washington State University)**[290]** *Approaching Equifinality: Pollen and Non-pollen Palynomorphs as Complementary Paleoecological Proxies*

In analyses of paleoenvironmental records, the specific effects of climate/precipitation patterns and human landscape impacts on ancient ecologies can be difficult to discern. As largely substrate-specific in nature, fungal spores may serve as proxy for a range of phenomena, such as soil erosion, landscape burning, vegetation clearance, moisture availability, and the existence of particular plant types in a given area. Microbotanicals, including pollen, fungal spores, phytoliths, and microcharcoal, isolated from a 2.5 meter sediment core recovered from Kingwal Swamp in western Kenya are used here to demonstrate the value of fungal palynomorphs as environmental indicators, particularly when employed in concert with these more traditional proxy types. I illustrate how cross-checking of palynological interpretations with fungal data can be used to refine models of landscape change and increase interpretive confidence via the elimination of equifinal trajectories potentially responsible for observed archaeological and

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

paleoecological data patterning. Examination of congruence, or lack thereof, between these lines of evidence can thus render past human ecological impacts more easily visible.

[73] *Eyes in the Dark: Explaining the Universal Ritual Function of Dark Zones via Eye-tracking Technology*

A plethora of ethnographic and archaeological evidence indicates a cross-cultural association of dark zones of caves with supernatural phenomena. In various geographic locations and time periods, human beings have been frequenting dark zones for ritual purposes. Regarding the unsuitable living conditions of dark zones, the following question arises: what drives humans to choose such places for practicing rituals? The answer to this question lies in the way human beings interact with dark cave environments. In this paper, I suggest that experiencing sensory deprivation, in particular lack of vision in dark zones, precipitates the enhancement of abstract and magical thinking. To verify this hypothesis, I employed the methods of cognitive scientists—namely, experimental research. I conducted an experiment using eye-tracking glasses to record participants' eye-movement trajectories in darkness. The results indicated that eye-movement patterns during darkness resemble that of activities involving abstract and primary process thinking (aka magical thinking). Consequently, darkness provokes and facilitates magical thinking. Thus, I suggest that in addition to social and cultural incentives, darkness, as an environmental cue, sets the stage for human beings to associate dark zones of caves with supernatural powers and therefore choose to practice rituals in such locations.

[77] *A Taste for Fish among the Saint Lawrence Iroquoians of the Montreal Region*

Iroquoian groups inhabiting the Saint Lawrence valley in the 15th and early 16th centuries were agriculturalists who complemented their diet with a variety of wild plant and animal foods. The relative importance of different food sources and their methods of preparation, however, likely varied from one community to another. To further document subsistence practices and foodways at the Iroquoian site of Dawson in Montreal, organic residue analysis was carried out on foodcrust and absorbed ceramic samples representing twenty-nine distinct containers recently excavated. Molecular characterization of lipids by gas chromatography-mass spectrometry (GCMS) show the presence of aquatic products in a great majority of samples. These data attest to the importance of freshwater fish for Iroquoians of the Montreal region and represent direct evidence of their frequent processing in ceramic containers, either alone or mixed with other ingredients. By combining these results with single compound isotope analysis (GC-c-IRMS) and the analysis of starch and phytolith microfossils, we hope to obtain a more complete picture of the range of foods prepared in pottery at the Dawson site, and ultimately shed new lights into food choices and culinary practices among the Saint Lawrence Iroquoians.

[23] *Reconstructing Individual Life Histories in Early Medieval Italy through Serial Analysis and Compositional Analysis of Bones and Teeth*

This contribution aims at gaining on the life history of individuals buried in northeastern Italy between the fifth and the seventh centuries AD. Elemental analysis of human and animal remains provides data on the evolution of diet and mobility at a time of significant social changes. Our research strategy, based on a preliminary histological study on teeth and bones and on serial sampling, gives us the opportunity to observe these variations at the level of the individual. Thus, this research provides us with some new insights on the consequences of the fall of the Roman Empire by revealing the living conditions of the inhabitants of the Po Valley during the formative period of the Langobard, Venetian and Byzantine Empires of Italy.

[16] *Technological Choice and Human-Animal Relationships: A Bird's Eye View*

New theoretical attitudes in zooarchaeology have begun exploring the social dimensions of human-animal relationships. As representative of both human-environment and human-material interactions, the dynamics between people and animals go well beyond household economics. This paper presents preliminary results of the analysis of avian remains from the Aleutian Islands as part of a study characterizing the complex relationship between the Unangan people and birds as it changes over time. Here, technological choice is used as a method for parsing out the many contingencies, economic, social, cultural and environmental, that constituted the interactions between Unangan and birds. This approach melds materiality with the classic economic and ecological approaches in order to employ a more comprehensive perspective on the subject-hood, if not subjectivity, that birds and animals retained in Unangan culture.

Takahashi, Akatsuki

[78] *Underwater Cultural Heritage Protection and Management in Pacific Island States*

The waters of the Pacific Ocean contains a wealth of Underwater Cultural Heritage (UCH) encompassing the history of humanity from the Stone Age to the Atomic Age and witnessing climate change. This paper presents a summary of the outcomes of the UCH Programme in Pacific Small Island Developing States (SIDS). Notable progress includes the reference to the UNESCO Convention on the Protection of the UCH in SAMOA Pathway outcome document (2014), national and regional capacity building workshops, and Chuuk Lagoon Ocean Emergency Response—Safeguarding UCH, Addressing Environmental Hazards—Project (2017). Updates on the other UNESCO Conventions such as the Convention concerning the Protection of the World Cultural and Natural Heritage and the Convention for the Safeguarding of the Intangible Cultural Heritage (ICH) are also provided in order to illustrate the concept of Heritage of Humanity and explore linkages among tangible, intangible and natural heritage safeguarding. The paper concludes by discussing the prospective of the Marine Archaeology from the Pacific SIDS perspective, which aims to engage the people in the Pacific in UCH protection with an integrated and community-based approach not only for scientific research cooperation but also for achieving the Sustainable Development Goals (SDGs), reconciliation and peace.

[49] *The Two Pillars of the Kingdom of Bagan, Myanmar: How Royalty and Religion Shaped the Settlement Patterns of an Empire*
Bagan was the political, economic, and cultural centre of Myanmar during the country's Classical Period (c. 800–1400 CE). This immense empire operated primarily on two institutions: the crown and the sangha (Buddhist monkhood). Kutho (merit) was arguably one of the most important Buddhist doctrines in Bagan as it was believed to guarantee better social status upon reincarnation. Kutho, for the elite, was most commonly obtained by contributing large donations to the sangha. These donations took the form of labourers, tax-free lands, or precious materials that were used for the construction of temples and monasteries, of which thousands continue to survive today. The construction of these buildings would have displaced a sizeable amount of the commoner population whilst also establishing new settlements. Despite the extensive archaeological potential in this region, no settlement studies have been conducted in Myanmar. Through inscriptions, murals, and ground survey along with the application of entanglement theory, this study will determine how the crown and the sangha worked together influencing the settlement patterns of the commoner population. This study will bring insight into a relatively new area of research in a region that is only beginning to open for archaeological work.

[130] *From Field to Screen: Best Practices for Digital Recording and Global Sharing of Catacombs from Late Roman Sicily*
Ten years after the seminal research on the digital recording of the monumental complex of The Catacombs of Saint Domitilla at Rome, undertaken by the Österreichische Akademie der Wissenschaften, the virtualization and the dissemination of 3d models of Late Roman catacombs is still a challenging research topic. While the catacombs of Rome are consistently considered for cutting edge digital archaeology projects, the underground cemeteries of Late Roman Sicily, the second in importance to those of Rome, struggles to get the digital visibility they deserve. Against this scenario, between 2013 and 2015 an Italian-American research project was undertaken at the Catacombs of St. Lucy at Siracusa. The research, including archaeological fieldwork, focuses on some very problematic parts of Region C. During the excavation, an array of 3D digital techniques was used for the daily recording of the archaeological units, but also to create high-resolution virtual replicas of certain districts of the catacombs and certain classes of materials, such as frescoes and marble architectural elements that could otherwise only be studied in the dark environment of the catacombs. The USF Digital Collections, a well-established multimedia repository of USF Libraries, has been chosen as global dissemination media.

Tankersley, Kenneth (University of Cincinnati)

[292] *Surviving Climate Change*
During the past decade, the University of Cincinnati has offered a summer archaeological field school, which focuses on periods of rapid and profound global climatic change. Students undertake detailed excavation profile descriptions, collect samples for AMS radiocarbon and OSL dating, botanical, faunal, soil, and geochemical analyses to develop an accurate chronology and paleoenvironmental framework of the depositional history for archaeological sites, which date to the Younger Dryas and Little Ice Age. From an evolutionary perspective, these are significant periods of change, which force people to economically adapt, downsize, or migrate. Data collected during these field schools have been published in co-authored articles in the journals *Nature*, *PNAS*, *Quaternary Research*, and *American Antiquity*.

Tappan, Katie K., Kelsey A. Gruntrad, G. Tucker Austin, Samantha N. Butler and Chrissina C. Burke

[187] *Rabbits, Pronghorn, Oh Deer! Oh My! A Preliminary Analysis of Subsistence Strategies at Wupatki National Monument, Northern Arizona*
Wupatki National Monument is a Puebloan site located in the Sinagua region of Northern Arizona, featuring an array of wildlife available to past populations for subsistence and technological purposes. Analyzing faunal remains from Colorado Plateau sites is an important part of developing a holistic understanding of the lifeways of agricultural communities in the Southwest. This poster focuses on the zooarchaeological analysis of materials from Wupatki National Monument housed at the Museum of Northern Arizona. By determining taxa present, minimum number of individuals, animal portions utilized, cultural modifications such as butchering, pot polish, and bone tool manufacture, and natural taphonomic signatures, we provide a thorough understanding of animal use through time at the site. We further examine the Garden-Hunting hypothesis and discuss the relative frequencies of Artiodactyls and Lagomorphs in the community's diet. Our research highlights the importance of zooarchaeology to understanding animal presence at the site and provides discussion on subsistence strategies as it relates to animal resource use in an arid environment.

[180] *Petroglyphs on the Periphery: Rock Art in the Canadian Maritimes*
Ongoing investigation of the Algonquian rock art of the Canadian Maritimes reveals that while some sites, such as Kejimikujik Lake, are well documented as a result of longstanding conservation strategies, these and other petroglyph sites have yet to be adequately and comprehensively framed within their archaeological, ethnohistorical and ethnographic contexts. Combining a landscape archaeology approach with theoretical positions emerging from the 'ontological turn' in archaeology, my research seeks to investigate the petroglyphs at various interrelated scales—from motif, to panel, to site, to landscape setting—in order to better understand the different functional and ideological levels at which these phenomena operated. Formal approaches using computational photography, principally Highlight Reflectance Transformation Imaging and photogrammetry, are employed to revisit known sites, test earlier interpretations, and to document new sites. Additionally, ethnohistories and ethnographies sought through collaboration with Mi'kmaq and Wolastoqiyik First Nations are used to articulate indigenous narratives alongside archaeological understandings of the petroglyphs. These complimentary approaches seek to inform how indigenous concepts of landscape, the environs of the rock art site, the material conditions of the rock surfaces, as well as the content and composition of the images engraved, combine to make socially significant places in the landscape.

[300] *Foodways and Urban Living: A Macrobotanical Analysis of Huari Homes*
Knowledge of Wari plant use has progressed significantly with analyses from sites such as Conchopata and Cerro Baul, but there has yet to be any investigation into Wari plant foodways at the capital city of Huari. This paper will investigate the botanical remains from flotation samples recovered throughout the 2017 excavations of Patipampa, a domestic sector of the site occupied during the Middle Horizon (AD 500–1000). For years, it has been assumed that the emergence of the Wari state in Ayacucho was fueled in part by maize agriculture. Preliminary results of the macrobotanical analysis will reveal what food crops people living at the site of Huari were actually consuming within their homes, and to what extent people were either using maize as a staple crop or maintaining a diverse diet. The assemblages of weed seeds and crop parts will also give insight into Wari agricultural

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

practices and the organization of labor inside and outside of the house. Furthermore, using Geographic Information Systems (GIS), the densities and distributions of plant remains will be studied within a variety of architectural spaces to understand how cooking and preparation may have been organized within the urban landscape of Huari.

[22] *Looking Through Dirty Dishes: The Preliminary Results of a Ceramic Analysis at Pandenarium (36ME253)*

In recent years, African Diaspora archaeology has become one of the most impactful means by which archaeologists supplement our current understanding of the past. Not only does this subfield have the potential to benefit descendant and local communities, but it also enables professionals to fill in the blank gaps left by the systematic disenfranchisement and intentional illiteracy of an entire group of people. One site with the potential to enhance our understanding of the African Diaspora is Pandenarium (36ME253) a freed African American settlement in western Pennsylvania. Current research at Pandenarium focuses on a comparative ceramic analysis with nearby European American sites, other freed African American sites, and slave quarters at plantation sites. The goal of this is to determine the socio-economic status of individuals living at Pandenarium, along with preferred food preparation methods and participation in local and regional markets. The preliminary results of the analysis featured in this paper are a foundation for future comparative studies featuring Pandenarium and will aid in the recognition of Pandenarium as a dynamic African Diaspora site deserving of further archaeological attention.

Taylor, Sarah (University of South Florida) and Robert H. Tychot (University of South Florida)

[270] *The Dietary Importance of Maize and Aquatic Resources during the Regional Development Period at El Dornajo, Southwest Ecuador*

Earlier studies of subsistence at the site of El Dornajo in southwestern Ecuador examined faunal, macro- and macro-botanical remains. These studies indicated that residents consumed large quantities of shellfish and marine fish during both the Formative and Regional Development periods (2800 BC—700 AD), with a marked decrease and differential access based on socioeconomic status in the later period. It has been hypothesized that site residents increased their reliance on domesticated plant foods, especially maize, in order to compensate for decreased consumption of marine foods. While no physical evidence for maize has been found, there exists a chance for bias based on poor preservation and sampling.

In order to better address dietary practices at the site and test the maize hypothesis, stable isotope and elemental analysis of 16 elite and non-elite individuals from the Regional Development period were conducted. Bone collagen carbon and nitrogen, and bone apatite and tooth enamel carbon and oxygen isotope ratios were determined, along with calcium, strontium, and barium elemental values. The isotopic results reinforce previous conclusions concerning diet at El Dornajo, including the lack of evidence for maize. We, therefore, conclude that any increased reliance on plant foods focused on other indigenous plant resources.

[304] *Zooarchaeology by Mass Spectrometry (ZooMS) and the Emergence of Nomadic Herding in Eastern Central Asia*

Identifying the timing and nature of the emergence of pastoral societies in eastern Central Asia is hampered by many key logistical challenges, including the scarcity of early nomadic habitation sites and the small and fragmented nature of related archaeofaunal assemblages. This study presents faunal identifications of animal bones from two recently discovered Bronze Age habitation sites in northern and western Mongolia using ZooMS (Zooarchaeology by Mass Spectrometry)- a technique that uses mass spectrometry to make taxonomic classifications based on peptide sequences from bone collagen. Results provide a window into diet and husbandry practices in the eastern Eurasian Steppe during the critical transition from hunting to herding societies, and indicate that ZooMS is a powerful tool for the investigation of early pastoral economies.

[27] *Cup and Channel Petroglyphs and Ancestral Puebloan Migration*

The age, origin, and function of the enigmatic cup and channel petroglyphs of the Arizona Strip have fascinated archaeologists for decades. The petroglyphs size, up to 2 m long, as well as, placement on horizontal surfaces at prominent locations, contributes to the intrigue of the glyphs. Previous hypotheses for the age and function of the petroglyphs include prehistoric navigational markers to water sources, solstice markers, historic tar burners, and ceremonial water channels. Hundreds of cup and channel petroglyphs are reported within a narrow 100 mile radius within southwest Utah and northwest Arizona. Little known evidence beyond this spatially confined distribution exists. The recent documentation of cup and channel petroglyphs at Homo'ovi, Woodruff Butte, and Awat'ovi in eastern Arizona expands this distribution and contributes new insight into temporal, spatial, and stylistic variation of cup and channel petroglyphs. This presentation offers inference into the newly documented glyphs' connection to the Arizona Strip Region. The data suggest cup and channel petroglyphs are signs of Virgin Puebloan migration to the Hopi Mesas.

[288] *Geochemical Analysis of the Soils and Floors of Ancient Activity Areas at the Site of Etlatongo, Oaxaca, Mexico*

Soil and floor samples from the ancient activity areas of Etlatongo were sampled and concentrations of extractable P and chelate extractable heavy metals. The relative concentrations of these elements have been shown to delineate areas of food preparation, consumption, and waste disposal. Increased heavy metal concentrations are indicative of the use of paints and pigments or the working of mineral ores. Low levels of these elements are usually present at sleeping areas and at high traffic pathways.

Texis, Ariel (Proyecto Arqueológico Tlalancaleca, Puebla), Shigeru Kabata (Proyecto Arqueológico Tlalancaleca, Puebla) and Tatsuya Murakami (Proyecto Arqueológico Tlalancaleca, Puebla)**[262]** *Tlalancaleca: Ceramics and Interregional Interactions in Formative Central Mexico*

Using ceramics as a proxy for social contact, we discuss a long history of interregional interactions of Tlalancaleca with other areas during the Formative Period. We have observed some clear changes of ceramic assemblages in the transitions between the Middle, Late, and Terminal Formative (or between the Texoloc, Tezoquipan, and Late Tezoquipan phases). While we do not imply that the presence or absence of certain ceramic traditions serves as direct indicators for political control, it is likely that Tlalancaleca formed part of important interaction spheres along with other areas such as the Morelos region, the Tehuacan Valley, the Basin of Mexico, and more lately with the Valley of Teotihuacan. Some ceramics resembling those from the Patlachique-Tzacualli tradition at Teotihuacan, which were formerly seen as foreign and brought after the abandonment of Tlalancaleca around 100 A.D., have been obtained from secure contexts in recent excavations of monumental architecture at Tlalancaleca. This suggests that the manufacture of similar ceramic traditions (with different raw materials) was widely shared among different social groups in Central Mexico just before the expansion of the Teotihuacan state.

Thacker, Paul (Wake Forest University)**[41]** *Emic Knapping Perspectives and the Analytical Concept of Raw Material Similarity: Building a Contextualized Theory of Lithic Raw Material Selection*

Existing frameworks for analyzing lithic raw material economies insufficiently characterize the complex interface of reduction strategies with local raw material variability. This presentation contextualizes assemblage technological organization from the Middle and Upper Paleolithic of Portugal with occurrence frequencies and size variability in local raw material cobbles. The new analytical concept of similarity differentiates Middle Paleolithic quartz preference within a pattern of overall raw material equivalency from two radically-different and synergistic chaînes opératoire structuring EUP assemblages. At the site of Espadanal, chert and quartz were utilized for different functions and as blanks for fashioning different tool forms, demonstrating that prehistoric knappers considered them dissimilar raw materials. Focusing on evidence for prehistoric decision-making facilitates a robust theoretical framework of raw material economy that integrates both the structural and the contextual.

Thibodeau, Alyson (Dickinson College), Allison Curley (Dickinson College), Emily Kaplan (Smithsonian National Museum of the American Indian) and Ellen Howe (Metropolitan Museum of Art)**[139]** *Lead Isotopes as Chronological Markers for Colonial Period Ritual Drinking Vessels in the Andes*

Ritual drinking vessels called qeros have been produced in the Andes for millennia. In the colonial period, Andean artists produced wooden qeros, many of which were decorated using a polychrome inlay technique. Almost all extant polychromed wooden qeros attributed to the colonial period derive from museum and private collections and lack provenience and precise means of dating. Here, we investigate the chronology and production of qeros by characterizing lead white pigment (lead hydroxycarbonate or lead carbonate, introduced to the Andes by the Spanish) used in the decoration of these vessels. We analyzed the Pb isotopic composition of lead white pigments taken from 21 colonial period qeros that currently reside in the collections of the National Museum of the American Indian-Smithsonian Institution, the American Museum of Natural History, the Brooklyn Museum of Art, and in private collections. The results indicate that, during the early colonial period Andean artists initially used lead white pigment manufactured from Spanish ores. In contrast, later period qeros were decorated with lead white pigment that was likely synthesized from local ore sources. Based on these results, we suggest the isotopic composition of lead white pigment may function as a chronological marker for colonial period qeros.

[82] *Household Distributions and Social Organization of the Ancient Maya in Southern Belize*

This paper examines processes of low-density urban development through geospatial analyses of households at two Classic Period (AD 250–800) Maya communities, Uxbenká and Ix Kuku'il. Located in the southern foothills of the Maya Mountains, Toledo District, Belize, these centers were situated in similar landscapes yet exhibited distinctly different household distributions. Wherein Uxbenká had geospatially discrete districts and neighborhoods while Ix Kuku'il's houses were more evenly distributed across the landscape with little evidence of social clustering. We compare several methods in a discussion of how archaeologists can model past human behaviors across a regional landscape based on both geospatial and chronological data in conjunction with material goods. Furthermore, we statistically analyze the influence of several social and ecological resources on the settlement patterns at Uxbenká and Ix Kuku'il. The results of these analyses suggest that the variations in household distributions reflect shifts in human decision-making dynamics during transitions of sociopolitical integration from autonomous, self-governing social units to top-down centralized authority influencing settlement locations.

[198] *Out with a Whimper or a Bang? Hunter-Gatherer Response to the End of the African Humid Period in Northern Malawi*

The modern climate of the southernmost African Rift Valley is characterized by a single warm-wet season, which receives almost all annual precipitation. The other six months are arid, and surface water is confined to major river and lake features. In the northern basin of Lake Malawi, at the southern extent of the modern ITCZ, core records show a rapid increase in water surface temperatures peaking at ~5.5 ka, followed by a major expansion of grasslands. This coincides with the end of the African Humid Period (AHP) further north, but it is unknown what impact this change had on parts of the landscape away from the Lake. The Kasitu and Luwelezi Rivers in the Mzimba District of northern Malawi offer perennial water in the incised Kasitu Valley, with paleosols and terrace sequences that show past changes in precipitation regimes. We report new results from three rock shelter sites from the Valley, which contain archaeological and paleoenvironmental archives of precipitation, vegetation, and human response to resource availability before and after the AHP. We pair these results with data from a new Sr isoscape, to further resolve how hunter-gatherer mobility and social relationships were impacted by resource distributions, prey availability, and precipitation.

[18] *Ancient Maya Diet, Environment, Animal Use and Exchange at El Mirador: The Zooarchaeological Evidence*

The site of El Mirador (Petén, Guatemala) is among the largest Preclassic settlements in the Maya lowlands. The site has attracted attention due to its size and antiquity, but also for its location within a region containing few permanent or perennial water sources. This study summarizes current zooarchaeological evidence from the site to assess past diet, habitat use, environment, and exchange. Comparative analysis demonstrates that the inhabitants of El Mirador conformed to certain widespread Preclassic dietary and animal use traditions. However, other animal use patterns are unique to the site, including on-site rearing of domestic turkeys, which was not conducted on a similar scale elsewhere in the Maya lowlands until the Postclassic (post-AD 1000). Inter-site comparisons of Preclassic animal use also reveal greater reliance on terrestrial fauna at El Mirador despite the presence of extensive wetland habitats near the site. Although a large portion of the El Mirador faunal remains date to the Late Preclassic (350 BC-AD 150), remains associated with a Late/Terminal Classic (AD 600–900) re-settlement provides an additional opportunity to address diachronic variation in animal use, and how the local environment changed or recovered after nearly 500 years of human abandonment.

[120] *Florida's Fluted Paleoindian Points: A Reassessment of the Typology*

Paleoindian points from Florida are different from the rest of the Southeast. Instrument-assisted fluting was never adopted, and Florida produced some apparently post-Clovis forms that are unlike any elsewhere. Several attempts have been made to sort out the myriad forms. This attempt uses landmark-based geometric morphometrics to more objectively distinguish fluted point forms.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Thurber, Hali (University of Arkansas) and Justin Uehlein (American University)**[39]** *Mapping Transience: An Archaeology of Hobo Movement and Placemaking*

GIS has become a powerful tool for visualizing cultural activity over time and space. We have found that it is invaluable in the archaeological study of movement and transient labor. In this paper, we aim to demonstrate how the use of geospatial technology in conjunction with the material record can offer a glimpse into the daily movements of transient laborers along Mid-Atlantic railway networks and industrial centers in the late 19th century through the Great Depression. Specifically, we suggest that the spatial relationships that emerge at an historic hobo jungle located just outside Delta, PA are not simply manifestations of economic or social hardship. Rather, we view transient worker movement and labor patterns as an essential aspect of early 20th century capitalism from which a unique form of resistance emerged. The distribution of artifacts within the site (revealing patterns of behavior by occupants coming and going from the camp over time), and the modeling of the physical location of the camp in proximity to the railroad, slate quarry, creek, and town center, are necessarily conjoined spatial and temporal units, which reveal a social structure dialectically entangled with the nearby town and broader regional economy.

Thurber, Hali [68] see Vining, Benjamin

Thurston, T. L. (SUNY Buffalo)**[220]** *Andra tider, andra seder: Shifting Taskscapes of Gender, Age and Class in Early Sweden*

Anecdotal evidence for rural gender and age-based divisions of labor are known for Medieval and Post-Medieval Sweden, and a handful of historians have discussed their implications in terms of the 'slices of time' they represent. Other more continuous geographic and archaeological data address the status of agricultural populations through increased or diminished affordances, economic opportunities, taxation and laws, as well as climate change and demographic transitions. How were these varying conditions experienced as changing gender- and lifecycle-based taskscapes, as landscapes of shifting labor and organization, and as substrata for the emergent ideas of modernity regarding life, work, and leisure? While these transformations can be followed among lowland cereal farmers, they are perhaps most starkly highlighted within upland communities in marginal contexts where older traditions, adjusted skills, and novel practices were constantly and simultaneously in play.

Thurston, T. L. [144] see Whalen, Kathryn

Tibbits, Tawny (Broward College)**[256]** *Sourcing Stones: PXRf Use at Pacbitun*

The Maya site of Pacbitun in Belize has produced large amounts of granite ground stone tools, debitage, and debris. Determining provenance is integral to reconstructing the chaîne opératoire of ground stone tool production at the site. Portable X-Ray fluorescence (pXRF) is becoming widely used in the field for quick and accurate geochemical assessments. Most prior archaeological work has focused on fine-grained materials, rather than coarse-grained rocks like granite. This project used geologic reference materials to assess the accuracy and validity of pXRF on coarse-grained rocks such as granite. It was determined that by using multiple data points per granite sample it is possible to generate an average composition that is statistically indistinguishable from traditional powdered samples. This method was used to compare the chemical signature of granite artifacts from Pacbitun to collected granite outcrop samples from throughout the Maya Mountains. The results of this project indicate that Mountain Pine Ridge is the likely source pluton for the granite being utilized at Pacbitun.

Tidwell, Wade (The University of Alabama)**[302]** *Artifact Ubiquity as an Index of Ancient Maya Socioeconomic Variability at Actuncan, Belize*

The Actuncan Archaeological Project has conducted ten field seasons of research at this ancient lowland Maya site in Belize, Central America and inventoried all artifact classes including ceramics, lithics, marine shell, jade, daub, etc. from excavation contexts. One of my research goals was to consolidate this information into a relational Access database so that project members could more easily analyze artifacts across contexts and time periods. The database allowed me to construct archaeological indices for documenting the ubiquity of artifact classes as a measure of socioeconomic variability across households or civic spaces. To achieve this goal, I explore which index is the most valid or useful, including the ratio of artifact classes potentially controlled by elites such as groundstone, jade and marine shell to the most commonly occurring ones (ceramics or lithics) or to excavation volume. Once these indices are created, I can identify structures or spaces that have disproportionately high or low ratios of materials and hypothesize how these areas were utilized by elite and common members of the society.

Tiesler, Vera (Universidad Autónoma de Yucatán)**[177]** *Embodying the Sun. Pyrotechniques as Part of Human Sacrifice in Ancient Mesoamerica*

In Mesoamerica, sacrificial ceremonies for the sake of religious merit-making tended to bridge polarities between action and symbols. Some of the ritual practices were mediated by mythical narratives surrounding domestic hearths, divine fire, and the sun itself. Among ancient Mesoamericans with their hierophagic cosmic understanding, the fiery protagonists to which sacrifices were destined to were deemed necessary complements of all life and had to be fed. This talk combines graphic and textual information with new findings of heat-exposed skeletal remains from Central and Eastern Mesoamerica to discuss different choreographies of sacrificial fire consumption of human bodies and their associated meanings in religion and political transaction.

Tiesler, Vera [330] see Rodriguez, Monica

Tiffany, Joseph and Shirley J. Schermer (Office of the State Archaeologist of Iowa)**[166]** *The Glenwood Phase Settlement System Revisited*

One of Larry Zimmerman's lasting contributions to archaeology is his research on the Central Plains tradition Glenwood culture in southwest Iowa. New site seriations, AMS radiocarbon dating, and site modeling utilizing GIS, all address fundamental assumptions derived from Zimmerman's research in the 1970s. The current model proposes a short-term occupation consisting primarily of dispersed farmsteads and possibly two or three unfortified house clusters in the Glenwood locality. Site location is resource driven; resource stress in the locality led to its abandonment.

Todd, Lawrence (GRSLE) and Kyle Wright (Shoshone National Forest)**[106]** *Structured Wilderness: Managing 19th and Early 20th Century Heritage Resources, Shoshone National Forest, Wyoming*

As the first National Forest that abuts Yellowstone Park, the Shoshone National Forest, northwestern Wyoming has a rich and diverse history of changing use and management. Over the last several years several projects that highlight this history have been conducted by the Shoshone and several partners. Two projects at Anderson Lodge (constructed ~1890) and Simpson Lake Lodge (1926) represent stabilization efforts at cabins representing both administrative and private uses of the back county before the Wilderness designation. The third project, the Gallaher Survey party

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

tree, documents the efforts of an 1893 team mapping the east and southern boundaries of the Yellowstone Forest Reserve. Efforts at these unusual Wilderness properties face numerous logistical and management difficulties, but the enthusiastic support of local, regional, and national partners clearly demonstrates the importance that the public places on these types of sites and highlights the need to a more richly nuanced perspective on evidences of human presence in our Nation's Wildernesses.

[109] *Giving Back: Debt in Classic Maya Narratives*

This paper considers textual and visual evidence of debt among Classic Maya nobles. It begins with an overview of lexical data and summarizes specific references to payment and accounting. The argument proceeds to some less obvious contexts such as 'just-so' myths, which reveal a notion of primordial transactions and gifts to be repaid in perpetuity. Finally, the paper considers the movement of inscribed objects. The argument is that giving those essentially inalienable possessions marked unredeemable obligations, which, nonetheless, could be transferred further down the social ladder along with the inscribed items.

[180] *Different Methods for Different Strokes: Petroglyphs in the Northern Cape, South Africa*

Our 2017 fieldwork in the Northern Cape, South Africa presented us with a dilemma: how do methods of rock art research aimed at studying image making help us understand petroglyphs that may not be "images". The site Wildebeest Kuil near Kimberley, Northern Cape has two discrete areas of engravings: an area covered with distinct images of animals, humans, "geometric patterns" (80% of engravings), and a second adjacent area covered with peckings and stone modifications that do not easily translate into images (90% of engravings). The presentation addresses (and interrogates) archaeological methods as guiding principles that may have to be broadened or adjusted in the face of different kinds of data.

[275] *From "Nation" to "Indio" and "Español": Transitions in Indigenous Culture in the Missions of San Antonio*

The Spanish colonial advance into Texas during the late 17th century resulted in the establishment of several missions to house members of dozens of indigenous groups and a handful of presidios to protect the missions from raiding bands of Comanches and Apaches. The Padres that were in charge of the missions enforced systematic policies and procedures to affect change in the identity of the resident indigenous nations. The policies and procedures specifically targeted religious beliefs, language, dress, and daily practice to re-shape the identity of the neophytes. To a large extent, elements of the indigenous material culture were not targeted for change. Descriptions of the behavior, appearance, and language-use of indigenous groups living in the missions depict a de-emphasis on one's own group identity in favor of the demographically dominant indigenous groups in each mission. Over time, indigenous leaders and children come to undertake the most rapid change to the Spanish cultural norms. The material culture reflects few of these rapid and dramatic changes in the identity of the mission Indians. This paper explores these processes of identity change, their reflection in the written record, and how and why some aspects of material culture remained a signature of Indigenous identity.

[95] *Ceramic Petrographers in the Americas: An Introduction to Our Mission and Goals*

Founded in June 2017, the mission of the Ceramic Petrographers in the Americas (CPA) group is the promotion, discussion, and development of ceramic petrography in archaeology. Of principal interest is providing resources for those interested in employing ceramic petrography for their research and those who would like to pursue this method as a specialty. The group consists of archaeologists residing in the Americas who use optical petrography and other characterization techniques to infer the geological provenance of pottery and to study ceramic technology all around the world. This poster describes how the CPA formed, our goals, and information on how to connect with us and other petrographers based in the Americas.

Toohey, Jason (University of Wyoming)

[207] *Diverging Patterns of Community Organization in the Late Intermediate Period Cajamarca Region of Northern Peru*

The organizational concept of ayllu has been central to many discussions of community generation and organization in the Andes, but the blanket application of ayllu is also problematic. In the Cajamarca region of northern Peru, the beginning of the Late Intermediate Period (A.D. 1000—A.D. 1450) saw a demographic shift, with many settlements forming or relocating to higher elevation defensible and occasionally fortified positions indicating possible increases in competition and conflict between local groups. This shift in the location of some communities might also reflect increasing economic specialization between farming and herding communities, as has been seen in some other Andean zones at this time. Recent research at the communities of Callacpuma and Yanaorco in Cajamarca is beginning to shed light on possible organizational differences between higher and lower elevation communities. Variability in spatial patterning, foodways, and ceramic production and use points to diverging patterns of organization among local Cajamarca communities at this time. I will argue for the development of community at the large scale, speaking to possibly increasing inter-settlement interaction and interdependency even in the face of increased local tensions during the LIP.

[103] *Why Do We Farm?: Risk Assessment of the Foraging Farming Transition in North America*

The evolution of the genus *Homo* is characterized by the emergence of numerous biological and cultural traits including bipedalism, encephalization, and language. A more recent adaptation led humans to transition from a foraging subsistence strategy to one based on farming. This is significant because foraging persisted for approximately 95% of human existence until farming emerged about 12,000 years ago. For nearly a century, anthropologists have studied the foraging-farming transition and proposed several hypotheses to explain its occurrence. Naturally, current research has prioritized ultimate explanations emphasizing long-term causality with limited research focusing on proximate explanations representing immediate causal mechanisms. This study evaluates the potential of "foraging risk" to have functioned as a proximate mechanism facilitating the transition to agriculture using a small sample within the North American Eastern Agriculture Complex, where independent domestication of numerous plants

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

occurred during the Late Archaic period (4500–4000 BP). This study uses species distribution models, archaeological diet data, and paleoenvironmental proxies to reconstruct the paleoenvironment, assess the availability of prehistoric resources, and compare expected and observed diets. Results of this research lead to a better understanding of the effect of foraging risk on the independent development of and ultimate foraging-farming transition in North America.

[156] *Moving Earth at Poverty Point: Investigating “Perforators” as Specialized Basket Making Tools*

Studying the development of technological specialization in cultural groups has been an interest of archaeologists for many years because specialization lends itself to the development of specialized labor. Technological specialization was a necessary factor in the building of the mounds and ridges at the late Archaic site at Poverty Point. Yet most of the research done to this point has been focused on the symbolic significance of the mounds and ridges, leaving our understanding of the development of the infrastructure necessary to create these structures surprisingly blank, even though 1.2 million cubic meters of soil must have been moved from other locations in some sort of containers. Imprints of baskets found in the excavations of Mound B indicate that baskets were the containers used. Little is known about how or where these baskets were made; I argue that the numerous perforators found at Poverty Point could have been used to create the massive quantity of baskets required to create the mounds. In this research, I explore the question of whether the perforators of Poverty Point were used in the production of basketry.

[270] *Violence among the Gallinazo: New Insights from Pampa la Cruz, Moche Valley*

The Moche of the North Coast of Peru, are well known for their ritualized culture of violence. Warriors, prisoners, weapon bundles, and sacrifice are commonly depicted in a variety of Moche media, and archaeological evidence from urban centers suggests such acts were practiced. What is not known is if the Early Intermediate Period ancestors of the Moche also engaged in such acts of violence. Pre-Moche, Gallinazo phase urban sites were often located in defensible settings and some show evidence of fortification. However, until now the archaeological record of the Moche Valley has not yielded bioarchaeological evidence of Gallinazo violence. We present the case of a multiple burial recovered from the rural fishing village of Pampa La Cruz, Huanchaco (50 BC/AD100-AD 500). The remains recovered show evidence of severe trauma. These individuals provide us with insight into the practices of violence during this time and allow us to explore the role that violence may have played both in Gallinazo society and in the rise of Moche hegemony.

[95] *Defining Petrographic Fabrics among Regional Wares at La Quemada, Zacatecas, Mexico*

Situated in the Malpaso Valley of Zacatecas, Mexico, the site of La Quemada was one of a series of polities that developed along the northern frontier of Mesoamerica during the Epiclassic period (A.D. 500–900). Widely distributed ceramic wares suggest interaction among northern frontier polities, but it remains unknown whether they are the product of widely recognized social categories (i.e., shared style) or direct, face-to-face interaction among individuals (i.e., shared composition). Answering this question requires distinguishing between local and nonlocal pottery found at La Quemada.

Despite geologic homogeneity observed across the northern frontier region due to an extensive ignimbrite province, previous characterization studies involving La Quemada pottery types have observed compositional variability among sherds and clays sampled from the Malpaso Valley. This poster builds upon these studies to define the set of ceramic fabrics observed in the La Quemada assemblage using a three-tier approach: (1) qualitative sorting and description of petrographic fabrics; (2) quantitative point counting of a proportional subsample of petrographic fabrics to test their mutual exclusivity; and (3) analysis of elemental data acquired from the clay matrix of point counted sherds and a set of briquettes made from natural Malpaso clays to establish local or nonlocal provenance.

[227] *Using Agent-Based Modeling to Study Constraints on the Social Learning of Lithic Technology*

Social learning is universally believed to be critical to the hominin adaptation. Yet when this becomes evident in our oldest cultural proxy, lithic artifacts, is hotly debated. Much of the variation in how archaeologists study this question is caused by differing assumptions related to the constraints on the performance, and thus the learning, of the flintknapping process. This paper explores the consequences of the physical constraints within lithic technology on its cultural transmission, using a spatially-explicit agent-based model. Building off of our previous work (PLoSOne 2016), we examine the incomplete social learning of the technological knowledge to produce curated lithic tool kits. We measure the number of learning events produced under the different constraints within flintknapping that reside at the heart of this debate. These constraints include where the learning occurred on the taskscape, the significance of the cognitive difference between strategic knowledge and tactical know-how, the degree of equifinality of products from different sequences, the generative entrenchment between products and sequences, and the size of the parameter space of lithic technology. Using

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

the developmental utility of our model, we discuss ways to improve both experimental and artifactual studies designed to test for social learning during the Stone Age.

[216] *Victims or Venerated? A Bioarchaeological Examination of Gendered Ritual Violence and Social Identity of the Possible Aqlla at Túcume, Peru*

Human sacrifices are frequently referred to as 'victims' of ritual violence, which presupposes that the sacrificed had no control over their fate or were unjustly harmed. Many examples of human sacrifice have been identified recently across the north coast of Peru involving a range of time periods and bodily treatment to suggest that there was incredible variation in practice, including in the identity of those sacrificed. Both males and females have been identified as sacrifices, but rarely are both found within the same sacrifice tradition suggesting that gender identity often played a role. This paper explores the various human sacrificial contexts at Túcume (1000–1532 CE) specifically focusing on the 19 young females from Huaca Larga who were inferred as an Inca Aqlla; supposedly killed to accompany the principal ruler at his death. While no direct perimortem trauma is evident, they do conform to mortuary treatments of human offerings. The osteological analysis of pathological stress markers suggests that these women did not necessarily lead lives of honored status, but suffered cranial trauma, dental disease, and episodic stress during childhood. Even if they came from lower social strata, their 'death' may have elevated their status, regardless of if they had a choice.

[268] *New Investigations of the Deer Creek Site, an Early Eighteenth Century Ancestral Wichita Village*

Deer Creek (34KA3) is one of few known fortified villages on the Southern Plains and was occupied during a critical point in Wichita tribal history. While researchers have been interested in this site for almost one hundred years, it was only two years ago that archaeologists were allowed to formally excavate the site. Following removal of dense brush cover in 2014, archaeologists with the University of Oklahoma, Oklahoma State University, Oklahoma Archaeological Survey, and the Oklahoma Anthropological Society conducted limited excavations at the site in 2016 and 2017. This poster presents preliminary results from this project which included the excavation of an interior fortification ditch, two trash mounds, and two storage/trash pits. Some highlights of our work include the recovery of articulated horse remains, a lithics cache, a number of French trade goods, quantities of bison and turtle bones, and paleofeces.

Tracey, Rachel (Queen's University Belfast)

[296] *Interpreting 'Irishness' in the Archaeological Record: A Northern Ireland Perspective*

The northern Irish town of Carrickfergus, in the seventeenth century, was a thriving settlement; home to a mixed population of English and Scottish settlers, in addition to a local Gaelic-Irish population. As such, the excavated material evidence is particularly suited to considerations of how we interpret, and eventually ascribe, identity in the archaeological record. Cultural identity, and expressions of such identity—be that Irishness, Britishness, or Ulster Scottishness—lie at the heart of existing sectarian divides and political histories in Northern Ireland, stemming from contested interpretations of British expansion into Ireland in the late sixteenth/early seventeenth century. A selection of artefacts from Carrickfergus will be presented to discuss the identification of 'Irishness' in material assemblages and our understanding of Irish society in the early modern period, particularly in relation to the role of choice in the use and adoption of material culture, and in terms of cross-class, cross-ethnicity material hybridity.

[68] *Historical Photogrammetry: Bringing a New Dimension to Historic Landscape Reconstruction*

Archaeologists always strive to use every available source of information when conducting research, and historic imagery and aerial photography are nothing new to the field. However, new technical developments are bringing another dimension to these old sources of information. Many historic aerial photos were taken in a series of densely overlapping photos to minimize the effects of lens distortion for use in surveillance, cartography, or other purposes where accuracy in measurement was important. While useful, the resulting photos also create stereoscopic sets that are ideal for analysis using photogrammetric methods. These techniques allow researchers to generate three-dimensional reconstructions of the landscape as it existed when the photos were taken. The resulting models can then be compared to models generated from modern imagery to examine landscape dynamics on a regional or local scale at extraordinarily high resolutions. Very small changes to the landscape, and to individual archaeological sites can be mapped, measured and analyzed. In some cases, it is even possible to explore sites that have ceased to exist today.

This article presents selected case studies from North and South America demonstrating some of the unique capabilities of this innovative approach to quickly and efficiently address archaeological questions.

[37] *Not Your Backyard Garden: Terraces in the Shadow of La Milpa's Temples*

Terrace construction for agriculture was integral to the survival and growth of ancient Maya centers in the Lowland Neotropics. Terraces supplied communities with food for consumption and trade, materials for construction and goods production, and plants of medicinal and ritual significance.

Research into ancient Maya agricultural practices has been largely situated in wetlands contexts, known to be sites of extensive landscape modification for agricultural purposes. Nevertheless, terraces are also identified as being integrated into the architectural arrangement of the cores of large urban

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

centers throughout the Maya Lowlands. This paper discusses one such set of terraces, built and maintained adjacent to the public monumental core of Classic-period La Milpa, the third largest ancient Maya urban center in Belize. Excavations conducted on this system of terraces, positioned in the shadow of the three largest monumental temples at La Milpa, uncovered a series of modestly constructed retaining walls spanning the crest and shoulders of a 7 m-high limestone outcrop. This presentation examines some of the preliminary results from these excavations, and provides a discussion of the methods that will be used to identify the types of plants that were cultivated on these urban terraces, emphasizing macro-botanical, phytolith, and starch analyses.

Tremain, Cara (Langara College)

[139] *Taking Ancient Maya Vases off their Pedestals: A Case Study in Optical Microscopy and Ultra Violet Light Examination*
Ancient Maya polychrome vases, especially those that are decorated with elaborately painted scenes, fill the display cases and collection drawers of museums and galleries around the world. Unfortunately, the majority of these are unprovenanced and many also lack clear provenance. Furthermore, modern restorations and/ or falsifications further muddy our understanding and blur the line between authentic and inauthentic. In order to learn more about these ceramics, and help to restore some of their life histories, detailed visual inspection and tactile examination is necessary. Situating such research within conservation departments is wholly appropriate because it allows for the application of specialized, non-invasive, equipment such as optical microscopy and ultra violet light. This paper discusses research undertaken by the author while a Smithsonian Pre-Doctoral Fellow at the National Museum of the American Indian, where more than 25 ancient Maya ceramics were investigated at the Cultural Resources Centre conservation department.

[80] *The Roots of Urbanization: Early Middle Preclassic Transformations to a Sedentary Lifestyle at Ceibal, Guatemala*
Our research at the Maya site of Ceibal, Guatemala, has led to new insights into processes involved in the transition of mobile hunting and horticultural populations to a more sedentary lifestyle and emergent social inequalities. Like in other areas of the world, the first architectural constructions at Ceibal, were public-ritual configurations, built communally by a still mobile population around 950 BC. Sedentism developed gradually and may have first involved people with higher social status and who may have been involved with carrying out public ritual performances. These early ritual constructions, often called an E-Group assemblage, set the stage for the first settlements and the accelerating urbanization of Maya settlements in the Preclassic.

[104] *Space and Architecture at LA 20,000, a 17th Century Spanish Ranch*
Domestic space both reflects the social order and contributes to its construction. In early colonial New Mexico, houses and other architecture created arenas in which social interactions among Spanish colonizers and indigenous peoples played out and ethnogenesis took place. Moreover Spanish economic production was household based, occurring primarily at rural ranches and mission compounds; consequently, the built environment at households also framed economic activity. Here, we explore the architecture at LA 20,000, a 17th-century Spanish ranch located southwest of Santa Fe. LA 20,000 was the home of colonizers and their workers and slaves, and produced basic subsistence goods. In this poster we reconstruct the physical layout of the ranch, exploring the creation of the architecture, the buildings' functions, and remodeling and destruction episodes. Archaeological investigations of this site have identified a series of corrals, a large multi-room domestic structure, a large barn, and other buildings. Artifacts and environmental samples complete the picture of economic activities taking place at the site. As the social context of cross-cultural interactions on a micro-scale, the physical context of this site was an important location for the exchange of information among Spanish colonizers and indigenous peoples.

[326] *Introduction to the USACE Veterans Curation Program*

For the last 100 years, the U.S. Army Corps of Engineers (USACE) has been accumulating archeological materials that require, by laws and regulations, adequate care that ensures continued preservation. USACE administers one of the largest archaeological collections in the country. However, these materials are in less than optimal condition. Overseas contingency operations have increased the number of veterans that lack the essential skills for the current job market. The Veterans Curation Program (VCP) was created to address these two needs with a single and effective solution. The VCP invests in service members by providing competitive pay and technical training to bolster existing skillsets. At VCP laboratories, the irreplaceable archaeological assets administered by USACE are repackaged and recorded using the most current techniques to ensure the safekeeping of our nation's cultural resources for future generations. To date, over 400 veterans have benefited from the program, of which 90% have either obtained employment or matriculated to colleges, universities, or certificate programs following program completion. With the passage of Public Law 114–189 in 2016, the VCP was codified, ensuring the program can continue to hire, train, and employ veterans and members of the Armed Forces while assisting in the curation efforts of USACE.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Urban archaeology can help us understand the evolution of specific habitational spaces and shed light to investigations related to domestic life and issues related to daily life necessities. This paper will trace the modifications completed to buildings within the walled city of San Juan in the late 19th century. A selection of structures was made based primarily on the permit requests and blueprints submitted to the local government which can be consulted at the Archivo General de Puerto Rico. Each case was supplemented with information taken from a variety of sources that include maps, photographs, census data and ownership records to develop a virtual map. Taking into consideration that space is an important component in the process of daily life choices, and the development of a domestic environment, this study will provide a connection between the people who occupied these buildings in the past and today.

Triozi, Nicholas

[35] *Competing with the Crown: Early Spanish Mission Settlement Decisions in a Human Behavioral Ecology Model*

Models developed from principles in human behavioral ecology have long benefited archaeological research. Drawing on natural features in the modern landscape, locations of prehistoric settlements can be evaluated in terms of calculable suitability. Such models also have predictive potential, as they can rank loci in terms of any combination of environmental conditions appropriate to the archaeological context being investigated. Where available, careful examination of ethnohistoric and cartographic documentation have pointed to parsimonious locations validated by excavation. When this documentation is unavailable, surface collections or remote sensing will afford some surveyed areas a second look. Such has been the case for the archaeology of many 16th- and 17th-century Spanish missions in the Southeast U.S. This paper considers environmental conditions and cultural landscapes encountered by Spanish missionaries, confirmed mission loci, and the royal directives for new mission towns as criteria for a testable, predictive model of early Spanish mission settlement locations. Using the ideal despotic distribution as a scaffold, criteria in this model are affected by the competition between royal ordinances and the "realities" of the natural and social landscape experienced by 16th-century Spaniards as they navigated the Atlantic coast of La Florida.

[32] *Banqueting with Tutankhamun: A Case Study in Determining the Function and Meaning of an Unprovenanced Artifact*

A striking example of the sophistication of the vitreous materials industry at the time it was produced, a faience bead depicting Tutankhamun drinking from a white lotus chalice possesses tremendous symbolic meaning that reflects the mores of the ancient Egyptian culture of the time. Although a published piece from the Eton College Collection, this is the first time extensive research has been performed on this unprovenanced artifact bought on the antiquities market in the late 1800s. Production of the bead occurred at the end of the Amarna Period during the reign of Tutankhamun and the return to orthodoxy of Egyptian culture. A comprehensive physical analysis of the bead confirmed its material composition as faience and indicated the process utilized in its production. Through the in-depth analysis of the components of the image, the iconography established it as a potent fertility symbol representative of royal regeneration. Then, based on the findings, the original appearance of the bead and its associated collar has been reconstructed, followed by a suggestion of its function in Egyptian society. The method of analyzing this complex artifact undertaken herein allows for the interpretation of an unprovenanced find in determining its meaning, use, and cultural significance.

Trivedi, Mudit (University of Chicago, Graduate student)

[56] *The Archaeology of Religious Conversion: Virtue and Tradition in the Indor Valley, North India*

This paper presents the results of an extended project directed at an archaeological investigation of religious conversion to Islam in South Asia. The project combined extensive regional survey, excavations and architectural documentation focused upon the site and valley of Indor, located in the region of Mewat on the borders of Rajasthan, North India.

The medieval residents of Mewat were stereotyped in contemporary imperial chronicles as primitive rebels, living in a forested hilly backwater, beyond the pale of civilized politics. After conversion to Islam in the fourteenth century CE, one group amongst them came to be known as the Khanzada lineage. The Khanzada founded Indor, a fortified city as monumental as any other in the region, and over the next five centuries, a salient attachment to place and a distinctive material repertoire were intrinsic to the Khanzada tradition.

This paper presents a contextualization of the site, its rapid emergence and the variable decline of its urbane capacities over 5 demonstrable phases of settlement in the Indor valley. Through analysis of the unprecedentedly rich assemblages of monumental sepulchral architecture and ornaments from Indor, it argues for the salience of the categories of tradition and virtue for the archaeology of religion.

Troccoli, Ruth (D.C. City Archaeologist) and Josh Silver (Lead Planner for Strategic Initiatives and Partner)

[251] *A New Frontier: Archaeology and Heritage Management Meet Urban Planning and Creative Placemaking*

Heritage Placemaking is a thing—embrace it! Learn from our mistakes. The DC Office of Planning received a grant from the Kresge Foundation to engage in creative placemaking by artist/curators with the goal of activating underused public spaces. The DC Archaeology Program saw this as an opportunity to engage in a novel form of public outreach funded by someone else. Despite best intentions, false starts, permitting issues, need for cultural sensitivity, and last-minute directives, the archaeology- and heritage-themed intervention "If YOU Lived Here" was a smashing success. Incorporating African American archaeology and history of the post-Civil War Barry Farm Freedman community, the artist/curator came up with a moving public art installation, and pushed us out of our comfort zone into a new and scary realm with its own vocabulary, processes, metrics, and requirements. Our partners included the Smithsonian's Anacostia Community Museum and the NPS.

[34] *A Small Rock Holding Back the Waves*

Islands are both understudied and spatially constrained, with often turbulent colonial histories. This paper reconsiders the conceptual basis of intra- and inter-island relationships in the context of archaeology. We argue that islands need not be isolated as geographic, ecologic or cultural entities and have not been so during the proto-historic and prehistoric periods. Using 21st century equilibrium theory and gateway theory we suggest that islands may be

in some contexts central places. We conclude that if one views the complex and dynamic interconnections of settler and indigenous identity through the lenses of locality, steady state sustainability, heterogeneity, gradualism, and interdependence, that a supply side analysis indicates that there are strong forces which influence the colonialism of islands towards vertical relationships of the trade dynamic if not the processes of production

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

themselves. Examples are provided from the Northern Latitudes including the islands as Osterøy and Radøy in Norway along with analogous examples from Aland and Lofoten and the Kiril and Aleutian island chains.

Troufflard, Joanna (University of Florida)

[116] *Understanding the Tapajó Socio-political System through the Study of Landscapes and Material Culture*

The socio-political organization of the Tapajó people living in the Lower Amazon region during late precolonial times has been studied through two main sources: contact chronicles and archaeological data coming from the Santarém site located at the mouth of the Tapajós River. Based on these sources, researchers have formulated three models to explain the socio-political organization of the Tapajó. However, recent surveys and excavations conducted in the upland Belterra plateau provide new data on ceremonial and domestic contexts and call for a re-evaluation of these models of social complexity. My project compares landscapes and material culture of riverine and upland settlements in order to challenge previous models of social complexity and formulate a new model that looks at the Tapajó occupation at a broader regional scale. Based on results of the upland Cedro site ceramic analysis and the comparison between riverine and upland sites, I argue that the Santarém and Cedro sites were organized as primary and secondary centers and maintained a heterarchical relationship during the late precolonial period.

[41] *Spatial Distribution of Stone Tools at Peyre Blanque*

Ancient people's organization of their social space can inform us about the kinds of activities that take place on a site. However, before making any cultural interpretations, the site's stratigraphic and formation processes need to be considered. The goal of this research is to examine how lithic tools are spatially arranged at Peyre Blanque to gain a better understanding of the site organization and how stratigraphic processes may have affected the artifacts. Peyre Blanque is an open-air camp related to an early phase in the Middle Magdalenian—roughly between 18,000 BP and 20,000 BP—located in southern France, north of Fabas, Ariège (Lacombe et al. 2012). Most artifacts are plot-pointed using a total station, so their horizontal and vertical location is known. Information about the stone tools, including their spatial location, classification “type” (such as a burin or scraper for example), maximum width, maximum length, weight, and contextual notes of nearby objects and features (such as roots and burrows) were examined. The artifacts are mapped in ArcGIS and some statistical analyses were used. There are several clusters of tools that show a differentiation of space at Peyre Blanque that appear to be more cultural than post-depositional in nature.

Truhan, Rebekah (University of Iowa)

[239] *The Grateful Dead: A GIS Approach to Determining the Correlation between Habitation Sites and Burial Sites in the Woodland Period in Iowa*

A powerful function of GIS is to look at spatial distributions of different components of settlement systems. During the Woodland Period, there appears to have been fundamental changes in economic and social organization, during the transition from hunting and gathering to substantial dependence on maize agriculture. Increasing dependence on maize agriculture appears to be correlated with increases in population and number of sites in the Late Woodland. What is less clear is the relationship between the number of burial mounds and the decreasing prominence of elite burials. While there has been an abundant amount of research conducted in locating mounds and burial sites using Geographic Information Systems (GIS) technology, there has been very little research done in looking at the correlation between burial sites and habitation sites in the Midwest region of North America. This project focuses on the Woodland period in the state of Iowa, which lasted from 500 B.C. to 1000 A.D., and will look at how the spatial distribution of these sites changes from the Early, Middle, and Late Woodland periods. This will be done by using the program Arc GIS, and the 1412 distinct habitation and burial sites in Iowa.

[27] *Becoming Virgin in Jenny Clay: An Analysis of Settlement Evolution and Kayenta Intrusion in Southern Utah*

Based on recent pedestrian survey of approximately 1,500 acres of BLM-managed land in the Grand Staircase-Escalante National Monument of southern Utah, this paper examines new evidence from 129 archaeological sites that demonstrates a deep settlement history as well as both expected and unexpected changes resulting from the so called “Kayenta Intrusion” of the Pueblo II period. The Jenny Clay study area is located in a broad alluvial valley surrounded by the Vermillion Cliffs, and contains several key resources that likely contributed to significant prehistoric settlement. Deep alluvium overlaid with thin to substantial aeolian sediments provided a range of opportunities for dry-farming agriculturalists; naturally occurring and often high quality petrified wood is readily available throughout the study area; water is available from perennial springs; and the study area is part of a deer migration corridor. While evidence of prehistoric use ranges from the late Paleoindian through to early Pueblo III periods, the primary settlement of the study area consists of substantial Virgin Anasazi occupation during the Pueblo II period. Through examination of architecture, ceramics, and site layout, this paper examines how the predominately Virgin Anasazi pattern is punctuated and potentially negotiated by migrants from the Kayenta region to the south.

[18] *Building a High-Resolution Chronology: A Case from the Maya Archaeological Site of El Palmar, Mexico*

This paper aims to refine the Maya chronology during the Classic period (A.D. 250–950) through the development of Bayesian models. In so doing, we combined radiocarbon dates with stratigraphic information, ceramic data, burials, and calendric dates from stone monuments. At the Center for Accelerator Mass Spectrometry of Yamagata University, we ran 78 radiocarbon samples recovered from the Guzmán Group, an outlying group located 1.3km north of El Palmar in southeastern Campeche, Mexico. To establish the ceramic sequence of the Guzmán Group, we used the type:variety-mode system that enables us to detect subtle changes in their forms and technologies. Furthermore, we reinforced the ceramic analyses through petrographic microscope. While the results of radiocarbon samples date from the Preclassic to the Terminal Classic period, this paper focuses on the second half of the Classic period (A.D. 600–950), a time of political turbulence in which the inhabitants of the Guzmán Group became involved.

[178] *Settlement Pattern Study on the Early Occupations in the Upper Huallaga Basin, Northern Peru*

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

The excavations at Kotosh by Japanese team during the 1960s demonstrated that in the Upper Huallaga Basin there are many archaeological sites corresponding to the time of the early development of Andean Civilization. One of the most important contributions of these studies is a fine-grained regional chronology from the Late Preceramic Period to the end of Early Horizon. The subsequent investigations in Cajamarca region of northern highland since the 1970s successfully elucidate diachronic process of early socio-economic transformations. This led us to re-examine the early cultural sequence the Upper Huallaga Basin after a half century from the excavations at Kotosh by incorporating new data set obtained from our most recent excavations there in 2016.

[330] *A Tale of Two Ports: A Preliminary Assessment of Ceramic and Artifactual Assemblages from Conil and Vista Alegre*
Coastal communities in the Maya Lowlands played a myriad of roles in the ebb and flow of political, economic, and social formations over the past 3000 years, yet these roles have remained along the periphery of Maya studies. Though ever present, Maya coastal sites were atypical—perhaps even idiosyncratic—in terms of how they were imagined and lived-in by the Maya. Critical to our understanding of these coastal settlements is the material culture traded and utilized by the occupants of these sites. In this paper we present our preliminary analysis of the ceramic and artifactual assemblages collected at the neighboring ancient Maya port sites of Vista Alegre and Conil during the 2016 and 2017 field seasons. Research at both sites included survey work and surface collection, off-structure test excavations, and architectural excavations. Aside from the strikingly high concentration and deeper deposits of material culture at Vista Alegre in comparison to Conil, these excavations have provided a better understanding of both sites' chronologies and their relations with other parts of the Maya and Mesoamerican world.

[120] *Assessing Biface Reduction and the Ideal Use-Life of Fluted Bifaces*
Various methods have been developed to assess the use-life of Paleoindian bifaces by focusing on morphological attributes. Comparative studies have often proven difficult in part because of the diverse nature of Paleoindian biface technologies in North America. While morphological ratios such as length-to-width vary considerably throughout biface use-lives, technological ratios related to fluting and lateral grinding typically remain more constant. In turn, technological variables may be more meaningful, and have the potential to inform us about decision making processes related to lithic technologies, i.e. when bifaces were discarded versus refurbished. The study sample analyzed here was selected to minimize external factors that could influence biface manufacture, such as raw material availability and package size. Fluted Clovis and Cumberland bifaces from the Lower Tennessee River Valley were selected because of the abundance of toolstone that is readily accessible throughout the region. Technological ratios and biface conditions were used to develop a general model for the ideal use-life of fluted Clovis and Cumberland bifaces.

[196] *Centering Alluitsoq: The Potential for an Indigenous Archaeology in Greenland*
Postcolonial and Indigenous archaeologies have changed the theoretical, methodological, and political landscapes of our discipline's engagement with regions and peoples once conceptualized as peripheral to the European core. However, some regions, and the subjects that move within them, still occupy the conceptual margins. This paper considers the position of archaeological praxes in Greenland, a constituent of the Kingdom of Denmark, and the late arrival of the postcolonial critique to Greenlandic archaeology. A new research project at Alluitsoq, formerly the German Moravian mission of Lichtenau, is taking up the agenda of the postcolonial critique and the movement toward an Indigenous archaeology. Using Alluitsoq as a case study, this paper discusses the implementation of theoretical and methodological strategies to center new subjects in a region dominated by Euro- and Paleo-focused studies. The author and a Greenlandic scholar are working together to collect oral histories from the now-dispersed descendant population of Alluitsoq to bring the community to the interpretive table. It is our hope that collaborative efforts in project design, fieldwork, and interpretation will all contribute to a decolonized archaeological practice in Greenland and produce usable narratives of the past for and by Greenlanders, who today struggle with the question of complete independence.

[91] *The XSX Ranch Site: Excavations of a Late Classic Mimbres to Early Post Classic Pueblo in the Upper Gila Forks, New Mexico*
The XSX Ranch site (LA 50702) is a multicomponent occupation located on the East Fork of the Gila River in Grant County, New Mexico. Between 1980 and 1992, Robert E. Forrester, a chemist from Texas, excavated 10 pithouses, 32 pueblo rooms in five roomblocks, and 91 burials at the site. In his little-known excavation reports, Forrester suggested the site was a Classic Mimbres occupation reoccupied by a Reserve/Tularosa population; however, in a review of his data, the site may best be interpreted as a medium-sized transitional late Classic Mimbres to Early Post Classic pueblo. This poster examines the site's architectural remains, mortuary patterns, and related funerary ceramics in comparison to other excavated Classic Mimbres occupations in the Forks region and using those data, suggests other sites that may have been occupied in the Gila Forks between circa AD 1130 and 1200.

Turner, Andrew D. (Yale University)

[209] *Weapons of the Sun: Centipedes and Fire Serpents in the Art and Symbolism of Ancient Mesoamerica*
In a myth that provided a charter for Mexica domination of Central Mexico, the deity Huitzilopochtli defeated his foes with a spear-thrower in the form of a fire serpent, or Xiuhcoatl. While Huitzilopochtli was a being unique to the Mexica, the Xiuhcoatl is generally considered to derive from an earlier entity referred to as the Teotihuacan War Serpent. Although the influence of Teotihuacan symbolism on later cultures of Central Mexico is undeniable, the portrayal of solar deities with supernatural zoomorphic weapons is more readily apparent in art of the Late Classic Maya Lowlands. Classic Maya solar

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

deities and rulers often wield lances in the form of skeletal centipedes with protruding tongues made of flint. This paper explores the relationship between supernatural centipedes and fire serpents and argues that Maya conceptions of solar weaponry contributed to the development of the bellicose sun gods of Late Postclassic Central Mexico.

[337b] *The Struggle to Maintain an African Cultural Identity: The Case of the Bahamas*

Once the British Parliament abolished the trans-Atlantic trade in African captives the Bahamas became a primary locale for the re-settlement of these persons. Between 1811 and 1860 some 6,000 liberated Africans, as they were called, were re-settled in the Bahamas. These Africans served apprenticeship periods of six to sixteen years, at the end of which they were to be free. Archival documents and archaeological evidence suggest that these indentured Africans were able to maintain a stronger African cultural identity as they settled into their new lives in these tiny islands in the Americas. However, an 18th century black cemetery in Nassau indicates that, long before this population of 'unacculturated' Africans were being settled in the Bahamas, earlier communities such as this one were devising means for allowing members of their communities to express and maintain their African cultural identity. These examples provide insight on the processes through which African peoples in the Americas managed to adjust to new lives in new environments.

Turner, Michelle (Binghamton University)

[27] *The Politics of Mud, Masonry and Landscape at the Aztec North Great House*

The Aztec North great house is a monumental Chaco-era building at Aztec Ruins National Monument, in northern New Mexico. Its size, its shape and its dramatic hilltop siting all echo construction norms for other great houses at Chaco Canyon and its outliers, but excavation revealed a surprising set of architectural features. In addition to a fairly typical great house artifact assemblage, we found Chaco-style wall foundations and masonry veneers, but non-Chacoan adobe wall cores. Drawing on ideas of social landscape and the materiality of mud and masonry construction, this paper explores the cultural and sociopolitical meaning of these architectural choices. Building with both adobe and stone implies a different organization of labor than a masonry structure, and perhaps participation by a wider subset of the community. Moreover, the adobe and its extravagant use of water differentiate this building from other Chaco-era structures. How might questions of labor and construction choices illuminate our understanding of political forces? Within the context of Aztec Ruins as a riverside community in an arid region, this paper considers the phenomenology of stone and mud construction, explores ideas of home and tradition, and connects the site to a greater social and political landscape.

[42] *Land and the Social Consequences of Land Loss: Navajo Oral History, Ethnoarchaeology, and Spatial Analysis at Wupatki National Monument, Arizona*

There is a contentious history between Navajo families living in the Wupatki Basin, ranchers, and the National Park Service. The creation of the monument in 1924 gradually displaced indigenous residents from ancestral homelands leading to loss of territory and connection to family. Here I focus on change in Euroamerican demands for land and federal management policies, as well as Navajo kinship, family dynamics, and oral history as told by descendants of the first Navajo settlers in the Wupatki Basin.

Using spatial analysis of settlements to discern Wupatki Navajo land use patterns before and after the establishment of the monument, I demonstrate the historic and ongoing importance of land and the social consequences of land loss for Navajo people. My findings are that the intersection of external pressures and internal factors led to disruption of traditional lifeways, values, and family, as well as loss of connection to culture.

[71] *Plant and Animal Remains from Old Babylonian Ur*

Archaeologists have been examining the great cities of ancient southern Mesopotamia for well over a century now, but as yet we have limited understanding of their subsistence economies. For decades researchers more or less ignored the wealth of faunal and botanical remains in and around ancient Mesopotamian architecture. Over the course of the twentieth century researchers began to recover animal bones and teeth, but as few digs dry-screened or floated their soils the resulting assemblages could not reveal the realities of ancient animal and plant management and exploitation. We present on fully screened and floated deposits from Old Babylonian (first half of the second millennium BCE) levels at the famed site of Ur. We compare and contrast remains from household middens inside the ancient city. We summarize plant and animal taxonomic proportions as well as animal skeletal element distributions and taphonomic characteristics. We provide a brief overview of the revealed Old Babylonian economy and discuss the extent of economic differentiation at Ur.

[77] *Prehistoric Obsidian Use in Southern Italy: Primary Acquisition and Down-the-Line Exchange in Calabria, Basilicata, and Campania*

Obsidian was a significant component of daily life in southern Italy during the Neolithic period (ca. 6000–3000 BC). Intensive surveys by Ammerman and colleagues in the 1970s identified a widespread presence of Neolithic obsidian in Calabria, generally thought to have come from the island of Lipari, mostly on the basis of its being the closest, along with general visual characteristics. While it was also thought possible to have small amounts of obsidian from the further away tiny island of Palmarola, only Lipari obsidian was present in the ~50 artifacts chemically analyzed.

Since then, extensive geological study of Lipari and the other Mediterranean obsidian sources has been conducted, while in the last ten years thousands of obsidian artifacts have been tested using non-destructive, portable X-ray fluorescence (pXRF) spectrometers. Specifically, about 2400 obsidian artifacts from the regions of Calabria, Basilicata, and Campania were analyzed from 2014–2017. The results fully support Lipari as the major resource, but obsidian from Palmarola, Pantelleria, and from multiple Sardinia subsources have also been identified in the region. The location and type of archaeological artifacts has been incorporated into our interpretation of the social dynamics of production and exchange during the Italian Neolithic revealing a vibrant exchange network.

[200] *Weathering of Surficial Lithic Assemblages in the Hyperarid Core of the Atacama Desert, Chile*

Surficial archaeological sites are widespread in arid environments. However, due to the difficulties in numerically dating them, they are usually considered as coarse indicators of past behaviors. Here, we explore the use of lithic weathering to develop local relative chronologies, and to better incorporate these assemblages into archaeological research. We test whether the most weathered artifacts should be considered the oldest; an assumption that has informally served to compare assemblages. Through macroscopic analyses, we compared seven surficial mid-to-late Holocene lithic assemblages from different micro-environments of the Atacama Desert, northern Chile. By recording changes in polish, texture, shine and color, we established that weathering varied significantly between two main locations: interfluvial and canyon sites. Lithics from interfluvial sites showed a dark coating and were moderately to highly weathered, whereas canyon lithics were mildly weathered and uncoated. This means that even within the hyperarid core of the Atacama, lithics of roughly the same age, are differentially weathered. We conclude that wind is the main weathering agent, mostly affecting artifacts deposited on inactive terraces or interfluvial sites, where they remain persistently at the surface. Consequently, we stress the importance of considering taphonomic, geomorphologic and archaeological factors together when trying to establish relative chronologies.

[54] *Historic Water Management Infrastructure in the San Pasquale Valley, Calabria, Italy*

Over the last several field seasons, the Bova Marina Archaeological Project has been documenting the timing of construction and the physical characteristics of the original water management infrastructure as well as documenting the changes in the natural and social systems of the San Pasquale Valley in Calabria, Italy. The Valley was recolonized in the 19th and early 20th centuries for both large scale bergamot plantations and by peasant farmers. With large scale population exodus from the Valley in the post-war period, much of this infrastructure is now also falling into disrepair, and the frequency and severity of damage from flash flood hazards is increasing. We have documented these processes through geoarchaeological and archaeological survey, interviews with the few remaining landowners in the region, and archival research. This poster showcases what we have learned about the social and natural processes at play in this community with regards to water management, and discusses the extent of damage that is now occurring each rainy season.

[123] *Cultural Diversity and Transculturation in the Pre-Columbian Indigenous Universe of Northern Hispaniola*

The island of Hispaniola has been considered an initial place by the formation of creole cultures in the Caribbean and the Americas. This consideration has been founded on the study of the socio-economic dynamics and cultural transformation generated by the European colonial irruption, especially the creation of first Spanish colonial settlement on the island. At the same time, generate an excessive dependency of archaeological data of ethnohistorical sources, and formalized a reductionist interpretation and a historical division in the study of the creolization process. This point of view has ignored essential aspects of cultural diversity, socio-cultural interactions, and the transculturation among indigenous communities since pre-Columbian times.

This presentation addresses, from archeological data and historical criticism, cultural plurality and transculturation among indigenous communities that inhabited northern Hispaniola prior to the European colonial invasion. It also evaluates its possible impacts on the emergence of a Creole culture in that region.

[26] *Conflict, Migration, and the Transformation of Network Interrelationships in Mississippian West-Central Illinois: A Multilayer Social Network Analysis*

Prior scholarship on intercultural contacts emphasizes interaction spheres, hybridization, technological transfer, or models of exchange as measures for constructing borders and defining societal membership. This presentation assesses how network relationships among complex and smaller-scale societies structured, and were restructured by, migration. Network models of social interaction and social identification are examined both prior to and following a migration process in a uniquely bellicose frontier region. In particular, the presentation addresses the role of ceramic industry in the transformation of communal scale interaction and identification networks across the middle to late Mississippian transition in the Late Prehistoric central Illinois River valley (ca. A.D. 1200–1450). Network models are analyzed to better understand how a circa 1300 A.D. in-migration of an Oneota tribal group restructured social relationships in a Mississippian chiefly environment and how communities of agents negotiated multicultural cohabitation in a region fraught with violence. A database of stylistic decorations elucidates categorical identification networks. Technological characterization data related to vessel form reveals interaction network models. Taken together, these networks create a multiple relations, or multilayer, network that is interrogated to demonstrate the role of network interrelationships as indicators of how both indigenous societies and migrant peoples approach intercultural social and economic relations.

[188] *Archaeology on the Half Shell: Preliminary Analysis of Shellfish Consumption at Coan Hall (44NB11), Virginia*

Coan Hall is the site of the first English settlement on the Northern Neck of Virginia, established by John Mottrom, an English merchant-planter, around 1640. Mottrom resided there with his family, servants, and slaves until his death in 1655. His descendants occupied the house until the early 18th century. It was situated on the banks of the Coan River, a brackish tributary of the Potomac River that empties into the Chesapeake Bay.

Representative samples of shellfish, predominantly those of eastern oyster (*Crassostrea virginica*), will be analyzed from primary contexts at Coan Hall

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

that represent three temporal periods: 1640s-1660s, 1670s-1680s, and 1710s-1720s. These periods correlate with phases of household occupation and with the demolition and filling of a large basement beneath the dwelling with domestic refuse from the nearby early 18th-century house that replaced Coan Hall.

Quantitative analyses will demonstrate whether there are measurable differences in the shellfish remains between contexts. We will establish whether shellfish were exploited from single versus multiple habitats and whether shellfish deposits represent single versus multiple harvesting episodes. This research will demonstrate the importance of shellfish to the diets of early settlers and explore the relationship between early colonists and the landscape of the Chesapeake Bay.

[257] *Incas, locales y otras identidades: Dinámicas materiales en el norte de Chile en tiempos del Tawantinsuyo*

Los estudios arqueológicos en Chile plantearon la ausencia de una conquista incaica propiamente tal en esta parte del Desierto de Atacama, puesto que sus poblaciones se hallaban insertas dentro de sistemas de complementariedad ecológica preincaicos, cuyas cabeceras o "señoríos" se encontraban en el altiplano del lago Titicaca. Y las que, una vez anexadas al Tawantinsuyo, implicaron un dominio casi automático de las restantes entidades ubicadas en lugares más alejados como las del norte chileno, situándolas en una condición periférica e incluso al margen del control cusqueño. Lo anterior ha redundado en plantearse la expansión y/o formación del Tawantinsuyo de manera dicotómica como una dinámica de presencia o ausencia, de incas y locales, centro o periferia, hegemonía o territorialidad, especialmente determinada por indicadores cerámicos y arquitectónicos. Esta situación, nos parece que invisibiliza la complejidad y heterogeneidad de los procesos expansivos e imperiales, sobre todo en sus dinámicas étnicas, identitarias y de clase, entendidas hoy como múltiples, ambiguas e incluso de resistencia. Gracias a los avances en la arqueología chilena, aprovechamos el marco de este simposio para discutir estas categorías desde el mismo análisis cerámico y arquitectónico a partir de distintos casos del Norte Grande, avanzando en la comprensión del fenómeno panandino.

[169] *Ireta: An Ethnohistoric and Archaeological Model of P'urépecha Urban Polities*

New archaeological research at the site of Angamuco, Michoacán, Mexico demonstrates unequivocally that the P'urépecha (Tarascans) had cities that before the formation of the Late Postclassic empire. This paper will reexamine the ethnohistoric and ethnographic evidence for the organizational structure of P'urépecha urban polities in light of the new archaeological evidence. The evidence presented here suggests a form of political organization superficially similar to the altepetl model of Nahua (Aztec) urban polities with nested political subdivisions that included both rural and urban areas. The descriptions presented in ethnohistoric documents are similar to archaeological patterns at Angamuco dating to at least the Early Postclassic. This indicates that many of the complex social institutions embedded within urban polities predate the formation of the Late Postclassic empire.

Urton, Gary (Harvard University)

[132] *The Tension between Standardization and Regionalism in Cord-Keeping in Tawantinsuyu*

Studies of the extant corpus of some 1,000 khipus from different regions around the former territory of the Inka Empire—Tawantinsuyu—show evidence of contradictory forces at work in terms of the forms and degree of standardization of recording structures and techniques. While, on one hand, there are marked differences in certain features of khipus from one region to the next throughout the empire, there are, on the other hand, notable similarities in other features. This paper examines the similarities and differences in khipus from archives around the empire—from the far north of Peru to northern Chile—to address the question of how cord-keeping represented a field of cultural and administrative practices that served state interests in the surveillance and control of subject populations in Tawantinsuyu.

[262] *"La del estribo": The Formative Funerary Goblets from Tetimpa, Puebla, Mexico*

A Mexican slang expression, "la del estribo" (one for the stirrup) refers to the extra glass before departing, the one that you take to continue your path. In many cultures, social drinking reinforces the collective fabric: to seal an accord, to pledge peace, or to celebrate the start or the end of an event. As death is the most crucial instance that both signals closure and new beginnings, today, as in the past, funerals often include libations. In the village of Tetimpa, some beverage was fitting for the last journey, since several of over a hundred burials have goblets. Their content is unknown, but as each house had, besides ollas for water, amphorae similar to those later used in Cholula for pulque, it might have been this or another fermented brew. Here we explore two aspects of the goblets: a) Do they show a modal distribution reflecting a unit of measurement?; and b) Is the volume of liquid they represent related to the deceased's importance as estimated by the mortuary expenditure (e.g., kind of deposit, specific location, "value" of the other offerings) or with the family's prominence as judged by residential investment (e.g., acreage, building dimensions and construction quality)?

Urwin, Chris (Monash University)

[114] *Excavating and Interpreting Ancestral Action—Stories from the Subsurface of Orokolo Bay, Papua New Guinea*

Orokolo Bay is a rapidly changing geomorphic and cultural landscape in which the ancestral past is constantly being interpreted and negotiated. This paper examines the importance of subsurface archaeological and geomorphological features for the various communities of Orokolo Bay as they maintain and re-construct cosmological and migration narratives. Everyday activities of gardening and digging at antecedent village locations bring

Orokolo Bay locals into regular engagement with buried ceramics (deposited during the ancestral 'hiri' trade) and thin strata of 'black sand' (iron sand). These deposits—both dating to within the past 700 years—provide material evidence for various spatio-temporal interpretations of the ancestor's actions and the structure of ancestral settlements. I conclude by examining how Orokolo understandings of their tangible past might interact with my own archaeological methods and results, and with proposed iron-sand mining on the south coast of Papua New Guinea.

[337b] *A Report of 2017 Archaeological Investigation at Okete-Kakini Palace Precinct, Idah, Niger-Benue Confluence, Nigeria*

This paper will report the 2017 excavation at Okete-Kakini site near the king's (Attah) palace in Idah. Okete-Kakini was the residential area of Attah's eunuchs (amonoji), one of the two major palace officials who carried out various functions for the Attah. The aim of the investigation is to identify the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

activities of the palatine elites through an examination of their material culture found in archaeological excavations. It is thought that the members of the palatine groups, like the formal elites, used their settlements and their day-to-day consumption to exhibit their status. The overall goal of the research was to have a better understanding of the social, political, and economic organization of Igalá and the intrasite distribution of materials.

Uzzle, Stephen (Cochise Community College) and Karen Schollmeyer (Archaeology Southwest)

[91] *Insights into the Salado Phenomenon from the Gila River Farm Site*

During the 2016–2017 Upper Gila Preservation Archaeology Field School, test excavations focused on the Gila River Farm Site [LA39315], located near Cliff, New Mexico. These excavations allow us to gain new insights into the Cliff phase (AD 1300–1450) in the upper Gila region. Despite evidence of looting and other disturbance, artifacts and data recovered here allow us to better understand several aspects of the Salado occupation of the site, including architectural styles, room function, resource procurement strategies, production and consumption, and possible trade and migration patterns. Comparisons of these patterns with other excavated sites in the Upper Gila area (including Dinwiddie and Ormand Village) carry interesting implications for understanding variability among Salado sites and the interactions of fourteenth-century site residents with contemporaneous groups.

Vacca, Kirsten (University of California, Berkeley) and Lisa Maher (University of California, Berkeley)

[295] *Exploring the Interpretative Roles of Microarchaeology, Ethnohistory and Ethnoarchaeology for Structuring Daily Life in Pre-contact Hawaiian Houses*

Ethnoarchaeology provides a useful tool for understanding material patterns in the archaeological record. However, caution must be exercised in the application of this method to avoid projecting data onto times and places that are no longer represented by contemporary practices. In this paper, the authors argue that ethnoarchaeology is most useful for projects that focus on the longue durée when used in conjunction with a combination of micro and macro archaeological methods. Specifically, the use of microartifacts and micromorphology in conjunction with analysis of excavated artifacts allow one to piece together site formation processes and material patterns that relate to specific activities. A case study utilizing Hawaiian house sites exemplifies this approach. The case study presented here analyzes data from 16th century house complexes, a time when daily practices were developing in ways not reflected in the (later) ethnohistories. However, this paper illustrates that utilizing complimentary micro and macro artifact analytical methods allows for a reconstruction of daily practices by comparing the data with the ethnohistorically-derived predictive models. The model for integration of ethnohistory is followed by a model for ethnoarchaeological work in Hawai'i that will further elucidate how repeated daily activities leave traces on the built landscape.

[209] *Cultural Legacies of the Classic Maya: The Postclassic Northern Maya Lowlands and Beyond*

Analysis of the iconography, hieroglyphic captions, and calendrical component of the Postclassic Maya codices, believed to derive from the Northern Maya Lowlands, provides important information about their possible antecedents. Portions of the Dresden Codex, for example, suggest clear links to the mural program painted on the interior of the Los Sabios structure from the site of Xultun, Guatemala, which includes a section with detailed calculations of a lunar cycle and another that may depict a yearbearer ceremony. Similarly, the Paris Codex includes calendrical tables that can be dated to the Classic period on the basis of astronomical referents, with hieroglyphic captions that likewise reflect this earlier time period. On the other hand, the Madrid Codex, likely produced in the eastern portion of the Northern Maya Lowlands, evidences broader networks of interchange, spanning the highlands of Puebla, Tlaxcala, and the central Mexican plateau. Commonalities include the structure of almanacs (including the in extenso and Formée Cross formats) and an emphasis on the 52-year Calendar Round with its quadripartite division of time and space.

[123] *Colonial Cuba: From Indian to Creole*

The construction of the Indian as a colonial category was one of the first resources of domination implemented by the Spaniards in the Antilles. The term with its social, economic and cultural implications served to homogenize and differentiate populations, to eliminate identities of origin and to build a destiny of subordination and disappearance. In Cuba this category was transformed over the last five centuries and adjusted to various historical circumstances. The historical and archaeological data of the Island indicate that the Indians did not maintain a passive attitude against the colonial power. They confronted or learned to interact with him and sought mechanisms of survival. Although mestizaje and acriollamiento have been seen as processes of ethnic and cultural neutralization of the Indian, and as part of the causes of their disappearance, they were also channels for their integration into the colonial world and have a determining role in the current survival of their legacy.

[55] *El Arte Rupestre en el Paisaje de la Tierra Caliente Michoacana*

La llamada Tierra Caliente, se ubica al sur del estado de Michoacán y abarca una extensa región que estuvo continuamente habitada desde hace miles de años. A pesar de las condiciones climáticas donde llegan a registrarse algunas de las temperaturas más altas del país, es una tierra llena de recursos naturales y fértiles tierras dentro de un paisaje de valles y sierras que han sido aprovechadas por los grupos humanos. Las fuertes condiciones y contrastes de la Tierra Caliente han llevado a desarrollar una forma de vida y expresiones culturales muy particulares. Dentro de esas expresiones culturales, se encuentran las manifestaciones gráfico-rupestres, donde las personas han dejado constancia de su morar en este espacio, siempre en estrecha relación con los elementos del paisaje. El objetivo del presente trabajo se centra en el uso de técnicas Fotogramétricas y de Sistemas de Información Geográficas, para llevarnos a una interpretación integral de los motivos representados, las distribuciones espaciales entre ellos, su interacción con el entorno natural y las intenciones de las personas que los grabaron.

[178] *Mayo Chinchipe-Marañón Complex, the Unexpected Spirits of the Ceja*

The fringes of the eastern Andean slopes that conform Ecuador's Ceja de Montaña are a steep transitional zone between the cordillera highlands and the Amazonian lowlands, where altitude varies from 1800 to ca. 400 masl. The ceja is covered by a dense humid tropical forest that has been traditionally seen as unfit for the development of social complexity. In spite of the apparent adverse ecological conditions this region became an important cultural area around 5000 years ago. A precocious ceremonial center has been discovered recently in the area of the headwaters of the Mayo Chinchipe hydraulic drainage. The site, called Santa Ana—La Florida, shows a complicated stone architectural layout, where two opposing platform mounds mark the extremes of a sunken circular plaza. One of the platforms held a circular structure that has been interpreted as a temple. Under this platform several elite tombs were found. The funerary paraphernalia shows the importance of the regional interactions that connected the Pacific coast the Andean highlands and the Amazonian lowlands. The iconography depicted in the stone and ceramic vessels suggest a strong ideological structure that led and managed the population on a regional scale ideological

Valdez, Lidio (MacEwan University)

[132] *The Inca State and the Valley of Acari, Peru*

The south coast of Peru was one of the regions conquered relatively early by the expanding Inca state. Following its incorporation, a series of Inca administrative centers were established, all linked by a branch of the Inca road. Tambo Viejo was established in the Acari Valley. The south coast was, in general, incorporated peacefully into the imperial system; the administrative control exercised by the Inca state was likely to have been exerted through local authorities. However, Inca control was brief and probably lasted no more than fifty years. As a result, the residents of valleys such as Acari experienced little change in their daily life. The architecture of Tambo Viejo and the associated ceramics do not exhibit strong external influence, but rather a low impact of Inca traditions. Though material items display only minor changes, Inca ideology is more apparent in the manner in which the layout of the center was planned. Tambo Viejo, although built with architecture in the local tradition, was conceived following the standardized Inca structural pattern that included a large rectangular plaza and an enormous mound that very likely served as an ushnu.

Valdez, Velma (Tribal Historic Preservation Officer), Angela Neller (Curator, Wanapum Heritage Center) and Lourdes Henebry-DeLeon (NAGPRA Program Director)

[253] *Tribal Agency and Federal Hegemony: NAGPRA in Action*

Our knowledge and traditions tell us that the Ancient One is our Ancestor. We have requested repatriation for nearly twenty years only to be blocked at every turn. The final judgment made at the United States Court of Appeals for the 9th Circuit placed the Claimant Tribes in the status of "interested party" in the minds of the federal agency. This is the hegemonic framework the tribes found themselves in when the US Army of Engineers made the official determination that the Ancient One is Native American and is subject to the processes and procedures outlined in the NAGPRA. The Claimant Tribes took a proactive approach by putting forth a Request for the Disposition of the Ancient One and conducting a supporting cultural affiliation study. The court's decision continued to influence the Corps' application, or misapplication, of the preponderance of evidence standard holding the tribes to a higher legal standard than is required by law and creating an uneven playing field.

[187] *Pinniped Taphonomy: Observations from a Northern Elephant Seal Breeding Colony Provide New Insights into the Taphonomic Processes on Pinnipeds*

Actualistic studies on vertebrate taphonomy have been focused on terrestrial mammals, and little is known about the taphonomic processes affecting marine mammals. Pinnipeds (seals, sea lions, fur seals) exhibit an extensive fossil and archaeological record, the interpretation of which is often impeded by the lack of research on their taphonomic processes. We present the preliminary results of a taphonomic study performed in a modern breeding colony of Northern elephant seal (NES; *Mirounga angustirostris*) located at Año Nuevo State Park, San Mateo County, California. Direct observations along linear transects were performed, and more than 350 isolated bones and 30 pinniped carcasses in variable states of decomposition, were recorded. Remains of rodents, birds, and fishes were also noted. Most of the remains were of NES pups, followed by adult and subadult California sea lions (*Zalophus californianus*). The study documented the predominance of disarticulated limb bones and the existence of geographic gradients in the bone distributions. Overall, these results underline the need for new and more exhaustive studies incorporating knowledge of the functional anatomy and natural history of the species, to elucidate the taphonomic processes involved in modern, archaeological, and fossil assemblages containing pinnipeds.

[173] *Regional Integration during the Late Preclassic in Uci, Yucatán*

Regional integration as materialized by the connections created through sacbeob can widely transform political, economic and social institutions in the participant communities. Perceiving the process through dichotomies such as center-periphery or paramount-subordinate clouds the agency of the multiple stakeholders involved in the matter. Active manipulation of social systems by intermediate elites and the commoner population seems to have had a great influence on the general process of integration. During the complex negotiations between the various sectors involved it seems likely that the activities carried out through the sacbeob (e.g., processions, exchange of products) would have greatly mitigated the frictions which would have been created. Studies at the communities connected by the Uci-Cansahcab sacbeob, in the NW plains of the Yucatan, are geared towards exploring these negotiations by considering multiple social sectors. Looking more closely at Uci as the proposed center for the micro-region during the Late Preclassic, we can assess the benefits and hindrances of regional integration. By using the concept of "disjuncture" we are able to contemplate the nature of the connections which linked the communities and how they varied within the region.

Van Alst, Emily (Indiana University)

[268] *Into the West(ern Plains): Results of the 2017 Bighorn Archaeology Field School, Park and Fremont Counties, Wyoming*

This presentation highlights several aspects of archaeological research and training undertaken by the Indiana University Bighorn Archaeology field school in its thirteenth year. Areas of study include documentation of Native residential campsites (stone circles) at the Heart Mountain Nature Conservancy; research at the Heart Mountain WWII Japanese American Confinement Site; photogrammetry of stone architecture (stone circles and cairns) and rock art around the Bighorn Basin; comparative rock art research at Legend Rock, Ten Sleep Nature Preserve, and the Oregon Basin; and post-fire inventory and site monitoring in the Washakie Wilderness of the Shoshone National Forest. Staff and students also engage with the public through traditional means and social media. Using different methodologies, Bighorn Archaeology's overarching research goals remain focused on exploring historical and social landscapes of the Greater Yellowstone Ecosystem and to communicate our results to professional audiences and the public. Through additional readings on the region's history and culture, we teach students to understand the West from multiple perspectives and to apply them to their personal interactions and experiences. Discussion of unfamiliar concepts communicated through familiar channels allows students more quickly to grasp complexities of the West and to think about them critically, especially in rural conservative American communities.

[269] *Developing an Immersive Experience of the Past*

As archaeologists, we are looking for ways to engage the public and help them learn about the past and human diversity. Using photogrammetry, photospheres, and digital 3D modelling, this project creates an immersive experience through Virtual Reality (VR) for the public to learn about the Ancestral Puebloan people. This poster demonstrates an interactive public outreach effort that can be replicated by universities and museums, with limited budgets, to convey their research. It is a straightforward endeavor of utilizing the proliferation of accessible smartphones, the increasingly popular and affordable VR technology (i.e., \$15 google cardboard), and social media. Therefore, archaeologists can utilize this technology to provide information to a broader audience.

Van Der Leeuw, Sander (SHESC)

[213] *Sustainability: The Next 100 Years*

This paper argues that much sustainability research, which sees the challenge as an environmental one rather than as a societal one, misses the fact that the societal changes that are occurring are so fundamental, as part of the Information and Communication Technology (ICT) revolution, that our societies will be unrecognizable before the impact of the environmental changes hits our world most heavily, in the second half of the current century. The paper will argue that developing a societal perspective on socio-environmental sustainability is essential to come to grips with our future. The Maya area is an interesting one to do this for, as its society is undergoing accelerated societal changes as part of globalization and development.

[14] *The S'Urachi Project: Cultural Encounters and Everyday Life around a Nuraghe in Phoenician and Punic Sardinia*

Nuraghi, the famous dry-stone walled towers of Sardinia, are usually just regarded as prehistoric monuments of the Bronze Age. They continued to be inhabited long after, however, and were transformed into often substantial settlements of later periods. Nuraghi are key sites for the investigation of the colonial encounters and cultural interactions between local Sardinians, Phoenician traders and Punic settlers, because they are the only places that were continuously inhabited before and during the colonial presence of Phoenicians and Carthaginians in Sardinia.

Nuraghe S'Urachi is situated in the Upper Campidano and Gulf of Oristano regions of west central Sardinia. Standing halfway between the Monti Ferru to the north and the Cabras salt marshes to the south, S'Urachi is located in a resource-rich landscape at just 15 miles away from the Phoenician colonial settlement of Tharros. Numerous imports and local adaptations testify to a long history of cultural and colonial entanglements.

In this poster, key results of the past five years of excavation at S'Urachi, are presented, showing first of all the continuity of occupation throughout the first millennium BCE, and the extent and depth of cultural interactions at the site between Phoenicians and Iron Age 'Nuragic' Sardinians.

[218] *In Homage to Homol'ovi: Architecture and Ceremony in Chaco Canyon*

As Adams significantly argued, there are clear relationships between the configuration of public Pueblo spaces and the nature of Pueblo ceremonialism. In this paper, I build on Adams' work to explore the relationships among architecture, public spaces, and ceremony at Chaco Canyon. Architectural spaces may be seen not only as functional containers for human activities, but also as resonant participants in affective human experiences. The visual and acoustic properties of public architecture in Chaco may assist us in understanding the Chacoan ceremonial experience from the vantage point of the human body. These insights can help support or refute particular models for Chacoan social and political organization through time.

Van Etten, Heidi

[74] *Reinvestigating the Chronostratigraphy of the Early Paleoindian Components of Hell Gap, Locality 1*

Hell Gap in eastern Wyoming contains the most complete Paleoindian cultural sequence in North America, providing insight into long-term landscape use and available resources exploited by early Americans. A well-developed chronology allows for clearer and more accurate comparisons of both cultural information and geologic data. Although Hell Gap is well studied and has provided archaeologists a wealth of information regarding the Paleoindian period, questions remain regarding the timing of events and geomorphology due to discrepancies with 14C dates and a complex stratigraphy. Some cultural components and sedimentary units remain undated. Discrepancies in the chronological record of Hell Gap may be better understood by improving the dating resolution using techniques not reliant on charcoal or cultural material such as that provided by OSL Dating. OSL samples were recently collected from Hell Gap, thus rendering a greater understanding of the timing of sediment deposition in relation to cultural sequences at the site.

[137] *Back to Basics: Next Generation Experimental Archaeology*

Experimental archaeology plays a critical role in the development of new ideas and techniques within the discipline, for example, within studies of artifact manufacture and use, butchery practices, taphonomy, etc. Despite a difference in the nature of 'controls,' out-of-the-lab experiments play a crucial role in scientific archaeology because they often shed new and different light on a range of complex issues, as demonstrated by recent house building experiments conducted with the assistance of local communities. These experiments illustrate the advantages of reaching outside the circle of

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

professional (lab-based) archaeologists and removing the barrier between re-enactors and craftspeople, on the one hand, and professional archaeologists, on the other. A critical limitation for many experiments, a lack of expertise in specialised tasks such as wood working, knapping, or thatching, can be overcome by involving experts outside academia. Not only are these experiments highly fruitful for scientific research, because they reveal and document lifeways foreign to the modern world, they are enjoyable and enable academics to get out of the ivory tower and reach out to a broader public.

[188] *Sulfur Isotope Ratios of Terrestrial and Coastal Fauna on the Southeastern Coast: A Step toward Resolving Equifinality in Human Paleodiet Reconstructions*

Sulfur isotope ratios in human bone collagen are used in paleodiet reconstructions to distinguish between marine- and terrestrial-based diets, because sulfur isotope ratios in marine organisms are typically higher. However, natural phenomena such as sea spray, rain, and flooding can deposit sea water sulfates on land that are bioavailable to plants and terrestrial animals. Comparing sulfur from archaeological deer and fish-eating raccoons from sites both in close proximity to the coast and further inland, this study examines whether sulfur isotope ratios have the potential to discern between marine and terrestrial foods in past human diets on the southeastern coast.

Van Keuren, Scott (University of Vermont)

[287] *How Long Did It Take to Paint Ancestral Pueblo Pottery?*

One of the basic goals of ceramic analysis is to reconstruct the manufacturing process. The sequence of production may be easy to infer but the duration of each step is elusive. For instance, archaeologists have yet to devise a method for estimating how long potters spent painting vessels. In the American Southwest, Ancestral Pueblo potters seem to have invested considerable time in these pursuits. Drawing on ethnoarchaeological scholarship, Pueblo ethnographies, and experimental archaeology, I present a new method that estimates minimum painting duration based on the organization and structure of brushstrokes. The latter mark discrete movements of the ancient potter's hand as s/he crafted, step-by-step, the overall design layout. Using examples from the Ancestral Pueblo world, I discuss what these estimates of painting time tell us about the social dimensions of ceramic production.

Van Oyen, Astrid (Cornell University)

[181] *Storage and Empire: Choreographies of Time and Matter at Rome's Harbours*

The capacity for storing surplus has been a key parameter in the hierarchical rankings of socio-political evolution, with empire at the apex. With its large-scale ports and massive warehouses, the Roman empire easily fits this bill. Models of socio-political evolution, however, not only build on top-down templates of power, but also adopt a view of things (i.e. stored goods) as passive resources. But in the light of recent material culture theory, storage becomes a more complex mediation of time and matter than the 'surplus model' could fathom, with power emerging from localized mediations of assemblages of humans and things, although with historical implications that were no less far-reaching.

This paper empirically traces the temporal and material choreographies of storage practices at Ostia and Portus, the main ports of the city of Rome. It investigates how things' trajectories through these ports and their warehouses articulated control and calculability, and it traces the resulting landscape of power. In so doing, it challenges old readings of an opposition between state control and private interests at these centres, and instead proposes a kaleidoscopic model of power, rooted in the material and metaphorical assemblage of the family.

Van Pelt, Paul [32] see Walsh, Carl

Van Thienen, Vince

[95] *Rethinking Migration and Mobility in the Late Roman West with Ceramic Petrography*

For some time the study of migration with ceramics was considered unreliable or unuseful after the ethnic discourse applied by cultural historians. The idea of 'pots=people' was heavily criticized, and rightly so: for similarities in style can result from mobility in people, goods and ideas. Yet, discarding the ceramic evidence altogether is not the solution. With a proper understanding of the limitations and issues, and ideally supplemented with other datasets, the distribution of ceramics and ceramic technology can be very useful in studying migration and even distinguishing between different kinds of mobility. This poster aims to demonstrate the use of ceramic petrography to investigate migration and mobility in the Late Roman West. By identifying fabrics of traditional house-made pottery from Roman Gaul (local) and several Germanic territories outside the Roman Empire (non-local), the results demonstrate continued traditions, the arrival of new immigrants with 'foreign' traditions and new or redefined ceramic productions. On the one hand, these new techniques are the result of technological changes due to restrictions and changes in natural resources, and on the other hand can be linked to choices resulted from the merging of various cultural and ethnic groups.

Van Vlack, Hannah (San Jose State University, California), Jamie A. Civitello (Bandelier National Monument, National Park Service), Rory P. Gauthier (Bandelier National Monument, National Park Service) and Robert Powers (University of New Mexico, Anthropology Department)

[269] *Ancestral Pueblo Agriculture on the Pajarito Plateau: A Geoscience Investigation of Field Terraces in the Northern Mountains of New Mexico*
In honor of Robert Powers, Bandelier National Monument (BNM) presents research on his final project investigating agricultural potential in the arid highlands of the American Southwest. Powers' research was conducted on behalf of the University of New Mexico's anthropology doctoral program for archaeology. The Park is well-known for its ancestral Pueblo archaeological sites and the unique, natural ecotones throughout the Eastern Jemez Mountains. The region is topographically dynamic; the landscape is shaped by tuff and talus deposits formed from early Quaternary volcanic eruptions, carved by ancient watersheds into a mesa plateau now punctuated by an intricate canyon system. The Pajarito Plateau refers to the mesa tops, where the ancestral Pueblo agricultural terraces are situated and laced among the pinyon and juniper woodland. The peopling of the Pajarito Plateau has been well-studied; however, the emergence of agricultural practice and stability in this arid region is relatively unexplored. The terrace contexts Powers' sampled likely date between the Classic and Coalition periods (Pueblo III and IV; AD 1150–1400). Conclusively, this project evaluates the information potential of legacy collections and interagency collaboration in the application of archaeological science for resource management.

[205] *Memory and Materiality at Mary's City of David*

Mary's City of David is a millenarian commune in Michigan, founded in 1903 and re-organized in 1930. As with all intentional communities, material culture (i.e., architecture, clothing, landscapes) serves as an active medium to both reflect and reinforce social ideals, and community members are keenly aware of the symbolic meanings represented. At their peak, the Benton Harbor colony sent out preachers to spread the word, bands to spread the music, and baseball teams to spread the game. These journeys are marked in various ways in the colony landscape and architecture. Additionally, social and collective memories serve to reinforce their beliefs. Individuals that are no longer living or events that happened long ago are commonly

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

remembered—often triggered by material objects, landscapes, plantings, or specific places at the colony. This serves to not only reinforce social and religious ideology in the present, but is also a theological promise for the future. In this paper I explore these material expressions of “home” and “community” in both the past and present colony and their central place in promoting and reinforcing community through social memory.

[296] *Glass Bottles at the McHugh Site: Patent Medicines, Frontier Health, and 19th Century Popular Culture*

Patent medicine bottles offer a window into the popular culture of 19th Century America and highlight the ways in which otherwise isolated populations were connected into broader social and economic networks. Settlers on the Wisconsin frontier in the mid-to-late 19th century had limited access to formal health care. Physicians who did provide services to remote populations were often poorly trained and had a limited understanding of the causes of many diseases. Thus, self-medication and alternative forms of health care became an attractive option for many frontier occupants. As a result of rapid industrialization during this period, many groups of immigrants were forced to abandon their ancestral ethnic identities and assimilate to a more homogeneous capitalistic American culture. This paper illustrates how patent medicine bottles recovered from the McHugh site provide an indication of how the McHugh family responded to the need for health care under the harsh conditions of frontier life in northeastern Wisconsin during the mid-to-late 19th century. Moreover, this analysis shows how broadly changing social conditions as well as the emergence of American popular culture may have shaped how the McHughs conceptualized ideas of sickness and disease.

Vander Linden, Marc (University of Cambridge)

[144] *“British”, “Irish” and “Continentish”: Practising Comparative in the Later Prehistory of North-Western Europe*

Projecting back notions of “British”, “Irish” or “European” back into prehistory does not go without problems as, explicitly or not, these concepts are closely associated with the rise of nation-states, and still echoed in yesterday’s and today’s turbulent politics. And yet, even advocating a simple geographic meaning for these terms does not prevent any problems, as it raises theoretical and methodological issues regarding the choice of location and scale of case-studies to be analysed. In the case of North-Western Europe, these problems are even more challenging given the insular character of several areas: does the Channel for instance work as a connecting fluid or as a water barrier? Are periods of cross-Channel interactions associated with increased connectivity within islands and the nearby continent?

In order to provide first elements of answer to these many questions, two distinct Later European case-studies will be explored; firstly, the early 4th mill. cal BC and, secondly, the introduction of animal and plant domesticates, and the late 3rd mill BC and the Bell Beaker Phenomenon. In both instance, long-standing debates have argued the contemporary association of extensive cross-Channel contacts, whilst recent aDNA studies have stressed the role of human migrations.

[310] *Farming, Warfare, Drought, and Soil Fertility in the Mississippian Central Illinois River Valley: Carbon and Nitrogen Isotopes on Maize Kernels from Five Sites Spanning Two Centuries*

We report on carbon and nitrogen isotope results from a total of 60 maize kernels from five sequentially-occupied sites in the Central Illinois River Valley that span the Mississippian period (AD 1100–1300). The sites span: (1) the onset of and intensification of warfare in the region; and (2) a long period of drought that eventually gave way to wetter conditions during the last 50 years of the sequence. C13 and N15 isotope values from these maize kernels provide independent support for the cessation of drought conditions during the final occupation, but also provide evidence for deteriorating soil fertility associated with intensive infield production.

[78] *Man and Machine—New Methods for Excavation, Documentation and Reconstruction of 29 Medieval and Renaissance Boat Wrecks from Oslo Harbour, Norway*

Since 2003, the Norwegian Maritime Museum has had several extensive excavations in the area of Bjørvika in the harbour of Oslo as a measure to document archaeological remains before being removed or covered during the rapid urban development of the area. This paper will discuss two of the major sites that have yielded 29 well-preserved boat wrecks and large areas of previously unknown harbour constructions of timber. Boats and constructions date to the 16th and early 17th century and varies from small boats of around five meters length to 20 meters long ships. All but one are built in the Nordic clinker technique.

The museum made the decision early to retrieve all boats and document every boat part with a digital 3D Faro-arm. We have chosen to use a combination of digital and traditional methods of documentation including cardboard models of the boats using 3D prints. In the process of building replicas of the boats, we have experienced the subjective contribution and practical knowledge of the older generation of boat archaeologists and skilled boat builders to be of great value to compliment the “objective” digital methods.

[42] *REAP in El Tajin: Looking towards Social Participation in a World Heritage Site*

The Pre-Hispanic city of El Tajin (Mexico) was inscribed on the UNESCO World Heritage List in 1992. Late on in the same decade UNESCO encouraged State Parties to foster “informed awareness on the part of the population... whose active participation [in conservation]...is essential”. Using the Rapid Ethnographic Assessment Procedures method (REAP) on fieldwork in Mexico, this paper aims to contrast global and local policies to improve participation of local communities generally and in particular of indigenous peoples in El Tajin. The inscription as Intangible Heritage in 2009 and 2012 of two cultural expressions of nearby Tajin village has added complexities to social participation that will also be discussed.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Vargas Ruiz, Juan (Universidad Externado de Colombia)**[75]** *Prehispanic Warfare, Leadership and Demography in the Llanos of the Orinoco, Northern South America*

Although for northern South America it has been proposed that warfare was an important mechanism that elites used to promote their authority and the institutionalization of their leadership during precolonial times, the evaluation of the available evidence is still not systematic. This presentation offers a comparative discussion about warfare in the Llanos of the Orinoco. The archaeological evidence suggests that warfare in the Llanos played a differential role in the historical and evolutionary sequences of the complex societies in the Llanos. In contrast to the Barinas (Venezuela) complex societies, in the Casanare (Colombia) region warfare was not a main factor that affected the emergence of central leadership or its consolidation at least during the first stages of the occupational sequence. The archaeological evidence recovered during the regional survey conducted in the Barinas and Casanare regions supports the ethnohistorical accounts of the varying extents of centralized power and the varying strategies used by emerging elites according to the capabilities and the possibilities at the disposal of aspiring rulers in different times and places.

Varillas, Rosa Maria (Proyecto Arqueológico Cerro de Oro) and Francesca Fernandini (Pontificia Universidad Católica del Perú)**[211]** *Wari Textiles for the Everyday and the Afterlife*

Some pre-Hispanic textiles were complex masterpieces made with labor-intensive techniques and high quality raw materials. Nevertheless, the vast majority of textiles, those used by the population at large, were plain, simple and without any decoration. This study will present a comparative analysis between a sample of plain weaves obtained from domestic contexts and a sample of high quality textiles excavated in an elaborated Wari tomb, all of them registered at the pre-Hispanic settlement of Cerro de Oro. This comparison will explore parameters to evaluate their quality and aesthetics as well as the cultural practices involved in their production. These lines of investigation will be incorporated within broader questions regarding the presence of Wari elements in the coast, and particularly within the site of Cerro de Oro.

Varlan, Abigail (The College of Wooster) and Olivia Navaro-Farr**[242]** *Trade Winds: A Study of Roman Ceramic Trade in the Balearic Islands*

The Balearic Islands, located off the coast of Spain, were occupied by the Romans beginning in 123 B.C.E. Under Roman occupation, the islands saw the development of Roman-style infrastructure and architecture in place of the pre-existing megalithic style of groups such as the Talayotic people. Sanisera and Pollentia are examples of Roman cities developed to facilitate trade and support the military needs of the empire. While excavations of the Balearic Islands have provided a wealth of data, this information is often underrepresented in Classical scholarship. An emphasis in Classical scholarship on documentary sources over the archaeological record results in the marginalizing of places like the Balearics, whose archaeological records are far more robust than Classical texts convey. We argue a comprehensive contextual analysis of ceramics from these sites not only underscores the importance of the islands in Roman trade, but contributes substantially to a more holistic understanding of the Classical Roman political economy.

Varney, Tamara, Treena Swanston (2Department of Anthropology, Economics and Politic), Ian Coulthard (Canadian Light Source), A. Reginald Murphy (National Parks Antigua) and David M. L. Cooper (1Department of Anatomy and Cell Biology, Universit)**[208]** *Unravelling the Social Determinants of Lead Exposure in 19th Century British Royal Navy Stationed in Antigua, W.I.*

An exploration into various aspects of lead exposure in the British Royal Navy stationed in 19th Century Antigua, West Indies has contributed to some unexpected insights. This research was facilitated by study of human remains mitigated from a Naval Hospital cemetery in response to modern development. The interred at the site were lower ranking naval personnel including enslaved individuals. Other work on lead exposure in the region focused on enslaved plantation laborers revealed high levels of the toxic metal in skeletal elements which was attributed to exposure in sugar processing. The work presented here focuses on enslaved African laborers in a military context. The patterns of lead exposure for this group are compared and contrasted with those of both the regular naval personnel and enslaved Africans in a plantation context. Similarities and differences seen in the lead burden of the bony remains between these three groups that were connected to the sugar industry in different capacities highlight into the variability in lived experiences of enslaved Africans in the colonial Caribbean.

Vasquez, Josefina (Universidad San Francisco de Quito)**[132]** *Puruwá Polity under Inka Rule in Colta, Chimborazo Province (Ecuador)*

The Inka incorporated the territory of today's Ecuador to the Tawantinsuyu around 1420. This conquest is well documented from South to North by recording the expansion of monumental features such as pukaras, tambos, bridges, terraces, collkas, wakas, patios and plazas, built in traditional Inka style. The political transformation of northern Andes landscape by the Inka was very profound in the Loja and Azuay provinces of southern Ecuador. While it was a milder transformative factor around Quito and other northern suyus. In the Chimborazo province, the Puruwá territory at the time of Inka expansion was transformed into an agricultural production area, as witnessed by the constructions of dozens of monumental terraces associated to nucleated houses that seem to be erected using Inka techniques. Both terrestrial and aerial survey data has been used to reconstruct the history of occupations of Colta region within the Chimborazo province to track changes in landscape that correspond to these sociopolitical events, as well as to natural catastrophes that modeled Puruwá patterns of economy before, during, and after Inka rule.

[141] *Producción metalúrgica en la Costa Sur: de Paracas a Nasca*

Las sociedades de Paracas y Nasca que habitaban el actual territorio de Ica, desarrollaron una tradición metalúrgica con características locales particulares dentro de los Andes Centrales. Los orígenes de la producción metalúrgica en esta zona se relacionan con la presencia de Chavín durante el Horizonte Temprano, y se caracteriza por el predominante uso de oro laminado y trabajado en formas y diseños simples. Esta tradición metalúrgica se mantuvo durante varios siglos en el sur, casi a espaldas del auge tecnológico que ocurría en el norte, donde existía una proliferación en técnicas, formas y estilos de producción de diferentes minerales y metales.

Para determinar continuidades y cambios a lo largo del tiempo, se vienen estudiando patrones de uso, estilístico o tecnológico de ambos desarrollos culturales Paracas-Nasca durante el período de transición entre ambos y en adelante. Las excavaciones científicas y la revisión de colecciones de museos, algunas con procedencia, incluyendo las inéditas piezas de metal de Rubini y Soldi procedentes de la Hacienda Ocucaje, los objetos metálicos recuperados por Tello en Wari Kayan y los hallazgos metálicos de los valles de Nasca y Palpa.

[42] *Treasure within the Fortress: Opportunities for Partnership in DoD Archaeology*

Some of the least known and best preserved archaeological resources in North America exist within the confines of federal property in the Department of Defense (DoD). The US military acquired large land holdings for the purposes of military training in the early nineteenth century, prior to suburban sprawl in the Northeast. The Army and subsequently the Air Force in a snapshot encapsulated whole communities that evolved in place since colonial times. Those archaeological resources, held in public trust by the federal agency, are protected under the National Historic Preservation Act from potential adverse effects of military activities and the DoD has cultural resource management programs that do so. Though a vast resource for American archaeology, few of those resources are known outside the federal agency. In this paper, I present two examples of untapped archaeological resources from Air Force installations in the eastern United States, the efforts to identify and hold those resources in trust, as well as the potential for collaboration in exploration of those resources beyond the DoD.

[251] *Rocks and a Box: Data Recovery of a Rural Domestic Complex*

Patriot Park North, located in the western side of Fairfax County, is a 67-acre park in which the Fairfax County Park Authority is planning to construct a baseball complex. Fairfax County Park Authority Archaeology and Collections Branch (ACB) conducted a comprehensive Phase I and II survey in Summer 2016, and began Phase III excavation in Fall 2016. An area in the northeastern section of project area contained artifacts from the late third quarter of the eighteenth century. A large feature, Feature 5, a 25 foot by 9 foot cellar, contained artifacts ranging from black glazed earthenware to green shell-edged pearlware and brass buttons. Other artifacts and features in the vicinity are suggestive of associated outbuildings. With further testing and continued analysis of the artifacts recovered, archaeologists can reconstruct the areas of use within the structure, and shed more light on the inhabitants of Fairfax County in the eighteenth century.

Venter, Marcie (Murray State University), Sean Carr (Independent Researcher) and Shayna Lindquist (University of Kentucky)

[285] *A Comparison of XRF and Visual Sourcing Methods in the Identification of Guadalupe Victoria Obsidian at Matacanela, Sierra de los Tuxtles*
Several Pre-Classic assemblages in the Mesoamerican Gulf lowlands are characterized by obsidian from the Guadalupe Victoria source. Tools produced are characterized by flake-core reduction strategies. The combined visual characteristics of the source material and technology employed are important chronological indicators. But, general similarities in the appearance of the raw material and factors such as variable thickness create the potential for overlap with other sources, such as Pico de Orizaba, though the latter tends to have fewer inclusions, making it more suitable for the production of prismatic blades than Guadalupe Victoria obsidian. Thus, the presence of clear-to-light-gray material in flake form is typically assigned to the Guadalupe Victoria source, whereas clear-to-light-gray material in blade form is often attributed to Pico de Orizaba. The presence of clear-to-light gray material in flake form throughout the occupational sequence of Pre-Classic and Classic period Matacanela challenged existing ideas about the efficacy of visual designation. As a result, we used pXRF to examine the entire assemblage of visually sourced Guadalupe Victoria material from excavated contexts to evaluate our accuracy in predicting source material. We present these findings, and offer suggestions for refinements of the analysis of materials and interaction patterns in the southern Gulf lowlands.

[310] *Evidence for Close Management of Sheep in Ancient Central Asia: Foddering Techniques and Transhumance in the Final Bronze Age*
Ancient animal management strategies have important implications for debates on modern pastoral landscape use in Eurasia. As livestock production intensifies in semi-arid regions there is a need to identify the diverse set of strategies employed by pastoralists. Sequential carbon ($\delta^{13}C$) and

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

oxygen ($\delta^{18}\text{O}$) isotope analysis of teeth from domesticated sheep at Bronze Age sites in Kazakhstan exhibit varied isotopic sequences. Sheep from Kent exhibit an inverse relationship where low $\delta^{18}\text{O}$ values coincide with high $\delta^{13}\text{C}$ values indicating that they ingested ^{13}C -enriched graze during the winter season. This pattern is consistent with the foddering of caprines during the winter months when they are living in sheltered valleys near the site. In contrast, sheep from Turgen exhibit diverse isotopic sequences indicating variation in husbandry practices and landscape use. This is expected, as the site is located in a mountainous landscape with access to high elevation summer pastures, forested areas, and the semi-arid steppe. The patterns evident at Turgen suggest that in the early period transhumance was practiced, while in later periods sheep were foddered throughout the year.

[134] *Cenote Xtoloc: Paying Attention to the Ignored Cenote*

A truism was established very early in Maya studies that the Cenote of Sacrifice at Chichen Itza had a religious function while the nearby Cenote Xtoloc was the source for domestic drinking water. Part of the attraction of this idea was no doubt its close paralleling of the popular Western dichotomy, sacred vs. profane. The problem with truisms, statements so obviously true that they say nothing new or interesting, is that they direct attention elsewhere. This is probably why the Temple of Xtoloc was never placed on the Carnegie map of Chichen Itza even though Ann Axtell Morris excavated there in the 1920s. When a truism is not true the impact can be disastrous for our understanding of the subject.

The Gran Aquifero Maya undertook a reexamination of the area surrounding the cenote as part of its assessment of all water sources at the site. The project found architectural enhancements that included stairways leading from sacbe to the water and constructed masonry platforms formalized this space. In addition, three caves in the northwest wall of the cenote were documented and mapped.

[92] *Prearchaic Land Use in Grass Valley, NV: A Novel Statistical Implementation of Optimal Distribution Models*

Despite decades of work, debate persists regarding the nature and extent of Prearchaic land use patterns in the North American Great Basin. While some archaeologists argue that Prearchaic hunter-gatherers favored a broad diet and, therefore, relied on a generalist land use strategy, others insist that they favored a narrow diet, thus relying instead on a specialist land use strategy. To help resolve these debates, here we ask the simple question: what environmental parameters drive variation in Prearchaic settlement decisions? To answer this question, we undertake a modelling exercise that evaluates Prearchaic settlement locations in Grass Valley, NV relative to measures of habitat suitability informed by Ideal Free Distribution and implemented using a Maximum Entropy approach to species distribution modeling. The results of this case study provide a quantitative measure of factors that structured land use decisions in the Great Basin prior to 9000 BP.

[88] *Mobility in North-eastern Italy between the Late Roman and Byzantine Periods*

The upheaval caused by the fall of the Roman Empire brought armies and new settlers in Italy in chaotic ways, producing significant changes to the socio-economic and political organization of the Empire. Material evidence has been irresolute in determining the actual significance of migratory movements due to the fast adoption of foreign customs to attain social power in the new political landscape. An interdisciplinary research using strontium isotope analyses on Late Roman and Byzantine individuals buried in southern Veneto and Emilia-Romagna in Italy is investigating mobility and migration directly. At a time when Italy seems a gateway to chaotic migratory fluxes, the research has the dual importance to investigate a past transition that is directly responsible for medieval and modern Europe, and understand mechanisms that might affect the perception of migratory movements. The preliminary results to be presented will attempt to quantify migration in a highly contested area and compare those values with the perception resulting from the study of material culture. This study compares isotopic data from bones against the perception detectable in historical sources and material culture, focusing on multiple funerary contexts within a small region.

[121] *Changing Patterns of Production and Exchange in "Borderland" Economies: The Case of the Classic Maya Civilization*

Following the trajectory of the work of Rita Wright, recent research has focused on production, producers, and exchange in a "borderland" zone, the "frontier" between Classic Maya lowland city-states and less complex, but more diverse, polities of the resource-rich highlands to the south. These "borderland" studies led to insights concerning exchange, production, and the roles of elite managers and non-elite "labor". Archaeologists and economists examined the material culture of dozens of sites to assess changing borderland partnership networks. This evidence revealed innovations in management and production strategies. Those innovations led rapidly to spectacular wealth, yet growing inequality, in a new economic system, while more conservative central lowland Maya states to the north were declining.

As in Wright's approach, this material culture history of these "borderlands" provided a foundation for application of social and economic theory including Innovation Network theories and Network Failure theories from economics. This research is directed upward to examine the "big picture" of changing state economic structure and "downward" to identify the agents and forms of agency involved. This work confirms Wright's conviction that borderlands production and its agents and material products provide keys to understanding ancient economic systems and the people that acted within them.

[141] *Technologies of Clay: Pottery, Architecture, and the Transformation of Mud in the Atacama Desert (South-Central Andes)*

In the Atacama Desert, pottery is one of the main technological changes of the Formative Period (ca. 2700 BP). The initial industry (LCA type) is characterized by a stylistic homogeneity coupled with a wide geographical distribution. Compositional analyses, however, have shown a significant regularity in pastes, suggesting the use of localized sources of raw materials and/or specific production centers—indicative of a well-defined recipe and style. Provenance studies have identified a locus of production in the Guatacondo valley, in the hyper-arid core of the Atacama. In this valley the production and consumption of LCA pottery coincides with the emergence of mud architecture. Both technologies were developed in a geomorphological environment characterized by multiple outcrops of clay, making this material easily accessible.

Using archaeometric methods, we approach both traditions as technological practices that required specific technical gestures, bodily engagements, labor organization, and temporal rhythms, mobilizing a collective that was partially constituted as such through the repeated and enduring transformation of mud. Considering the networks of materials, practices, and spheres of circulation wrought by these technologies, we offer an interpretation of the Formative process that centers on the qualities of clay in order to understand the material trajectories of this social landscape.

[37] *Preclassic Maya Ceramic Production and Distribution: Preliminary Petrographic Analysis from the Mopan Valley, Belize*

Understanding the organization of ancient ceramic production and distribution patterns can provide archaeologists a means of exploring past economies. Recent studies have shown that petrographic analysis can be operationalized to detect variability in production recipes, distribution of production groups across a landscape, and even producer-specific material choices. Ceramicists working in the Maya lowlands have demonstrated the benefit of using petrographic analysis in conjunction with other methods including type/variety. Few studies, however, have focused on the Preclassic period to address questions related to early economic organization through ceramic production and distribution. Fewer still have engaged with traditional potters whose knowledge of local clay sources prove invaluable to the broader discussion of ceramic production. This paper presents the preliminary results of a study from the Mopan Valley, Belize, comparing ceramics from domestic and public contexts to clay sources from the greater Xunantunich area. The study incorporates the petrographic analysis of three locally known clay sources and two buried sources discovered during excavation, as well as Middle Preclassic ceramics from both domestic and public contexts. The initial results have important implications for archaeologists' understanding of the organization of production and distribution of early ceramics in this region.

Vining, Benjamin (University of Arkansas, Fayetteville) and Hali Thurber (University of Arkansas, Fayetteville)

[68] *Detecting el Niño's Disasters: Remote Sensing of Recent ENSO Events in Northern Peru and Implications for Prehispanic Societies*

Several models have discussed links between warm (el Niño) phases of the el Niño Southern Oscillation (ENSO) and cultural developments on Peru's north coast. In particular, the abandonment of Moche settlements and agricultural systems and periods of social stress in both Moche and Chimu societies have been interpreted through the lens of ENSO disasters. ENSOs during the years 1982–83, 1997–98, and most recently 2016–17 offer the opportunity to better understand the spatial development of el Niño-driven events through remote sensing, and hence to better understand potential implications of ENSO for past and current communities. Here, we use data from the Landsat and Sentinel families of earth observation satellites to describe the extent and severity of these ENSO's impacts on the Chicama and Jequetepeque Valleys (Department of La Libertad, Peru). We estimate the areas that are impacted by mass wasting and sediment entrainment, and describe the recovery time from past events. Comparisons of similar events across individual ENSO years show spatial patterning in the areas that are impacted by various ENSO-driven phenomena. We discuss the implications these findings have in light of archaeological land use, including identifying several vulnerabilities that may have affected prehispanic agriculture and settlement.

Vis, Benjamin

[80] *An Inhabitant's Perspective of Material Urban Structure at Chunchucmil*

Maya urban archaeology is progressively addressing how to 'people the past', using data exploration techniques. The Chunchucmil map (Hutson and Magnoni 2017) offers an exemplary spatial data resource. Chunchucmil features here as a testing ground for showcasing the interpretive research advances enabled by Boundary Line Type (BLT) Mapping.

BLT Mapping resulted from establishing a common frame of reference to make radical comparisons between Maya and contemporary urban patterns. The anticipation of the step increase in knowledge about the spatial layout of Maya cities achieved by LiDAR surveys, makes comparative research on Maya urbanism highly relevant. Here I will examine sections of Chunchucmil's built environment to evaluate the interpretive contribution of BLT Mapping analyses to internal comparisons of urban configurations.

The methodology explores an inhabitant's perspective on urban life and development. BLT Mapping conceptualises urban built environments as compositions of materialised boundaries. The boundaries fix focus on the small scale urban morphology of spatial-material properties, which are mapped as socio-spatial characteristics. Topographical information is not used to explain top-down how general patterns came to exist, but to explore how everyday inhabitation of Chunchucmil's urban space is structured by opportunities and experiences afforded by spatial morphology.

[298] *Changing Landscapes: Settlement Strategies, Cultural Dynamics, and Material Evidence on Kos, Dodecanese, during the Final Neolithic and the Bronze Age*

Landscape as a concept incorporates not simply the geographic and environmental characteristics of an area, but also the cultural and symbolic value vested in places. Understanding the relationship of these factors, which are often closely linked, to past societies remains a challenge in archaeology. In this paper, we attempt to reconstruct the Final Neolithic (FN) through Bronze Age landscape on the island of Kos, Dodecanese, and investigate its cultural meaning to the prehistoric peoples. We combine environmental methodologies, using GIS to examine the relationship of topography, viewsheds, vegetation, and resource distribution to site location, with the analysis of significant changes in the material cultural assemblage. Our

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

results identify shifts in occupation patterns from sparse upland settings in the FN and the Early Bronze Age (EBA) 1–2 phases to a nucleated center in the coastal plain beginning in EBA 3. In addition, changes in ceramic repertoire, fabric mixes, and technology, as well as in ceremonial and burial practices, demonstrate a parallel shift in the perception of landscape through time. Cultural contact and a growing participation in wider regional trade networks are considered factors contributing to this changing view and use of the Koan landscape.

[229] *The Penumbra of Castro Archaeology: Evidence and Questions*

The archaeology and socio-cultural practices of Iron Age hilltop fortified settlements (castros) in Northwest Portugal and Galicia present usual and unusual specific problems. From the recognition of the uniqueness of castro cultural practices in the late nineteenth century to the last decades of the twentieth century, castro archaeology has suffered from the inadequate methodologies of earlier excavations, poor temporal controls, a parochial stance toward entertaining unanswered questions, and from the overall absence of burial contexts. These factors have often resulted in broad-stroke analyses that normalize castro cultural practices. This paper will discuss what is actually known about castro practices in littoral Portugal on the basis of recent evidence, and examine issues and evidence the archaeological excavations at the Cividade de Bagunte have uncovered.

[106] *Preliminary Results from Excavations of a Communal Pit Structure in the Gila National Forest*

As part of the recent salvage recovery effort at the South Diamond Creek Pueblo (LA 181765), a small Classic Mimbres pueblo (1000–1150 CE) in the Aldo Leopold Wilderness of the Gila National Forest, excavation was performed on a large pit structure that appears to be associated with an earlier occupation of the area. Sample excavation was performed as part of a field school directed by Dr. Fumiyasu Arakawa of New Mexico State University under. Very few archaeological investigations have been conducted in this area. The data recovered from this structure will contribute to a sparse data set on communal pit structures from this northern edge of the Mimbres boundary. With the work performed in the summer of 2017, numerous artifacts were discovered that will aid in the dating of the pit structure. This poster will provide a glimpse into the excavation and will present preliminary results

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

of the excavation effort. Continued work on this site offers a new perspective into the northern Mimbres during the Late Pithouse period (550–1000 CE).

Wagner, Mark and Ryan Campbell (Southern Illinois University Carbondale)

[39] *Bound to the Western Waters: Searching for Lewis and Clark at Ft. Kaskaskia, Illinois*

Lewis and Clark recruited 11 soldiers from the small US Army outpost of Ft. Kaskaskia (1802–1807), Illinois, in 1803 to join their expedition to explore the American west. This event traditionally has been identified as having occurred at a 1750s French fort of the same name. The 2017 SIU summer field school investigations within the fort walls including the use of LIDAR, GPR, and hand excavations revealed that the fort is primarily a single component French construction dating to the mid-1700s that contains a small number of colonial French artifacts as well as a barracks and bakehouse. No evidence was found that the United States Army later rebuilt and reoccupied the fort in the early 1800s. LIDAR, GPR, and hand investigation of a nearby hilltop known as “Garrison Hill” located an extensive brick scatter intermixed with early 1800s military items that clearly interpreted as representing the remains of the 1802–1807 American Ft. Kaskaskia. This rediscovery of one of the pivotal sites of the Lewis and Clark Expedition not only corrects history but affords an opportunity to recover information on the daily lives and material possessions of American soldiers immediately prior to the start of the Lewis and Clark expedition.

[260] *Settlement, Subsistence, Culture Change and Networking: New Perspectives on Bocas del Toro's Integration with Greater Central America*
Understanding the settlement chronology and degree of interaction and integration of Caribbean western Panama within “Gran Chiriqui” and greater Central America has driven archaeological research in the region since the 1950's. Hernan Colon's accounts of Bocas and adjacent Costa Rica depict a populous region, with vast fields of maize, people traveling about in numerous canoes and wearing more gold objects than ever seen in the New World. Lothrop's 1947 synopsis of the “myth” of the Sigua settlement of Panama/Costa Rica Caribbean coastal plain suggests an enduring influence of Nahua, perhaps even Mexica, speakers moving into the region from the North. Linares' and Ranere's 1980 foundational study of western Panama raised perhaps more questions than it provided answers. Together these works have inspired a new generation of archaeological study in the region, the results of which have radically altered the perception of the area's pre-colonial history. A synthesis of new data more clearly illustrates the time-depth of greater Bocas del Toro's settlement, subsistence system, and interaction with greater Central America.

Walden, John (University of Pittsburgh)

[82] *Neighborhood Integration in Low Density Cities Which Follow a Divergent ('Outside-In') Urban Trajectory*

One relatively understudied aspect of neighborhood integration in ancient cities relates to the divergent trajectories along which cities form. In some ancient cities, the urban periphery appeared as autonomous communities prior to the development of a center, representing an ‘outside-in’ model of urbanism. Such contexts provide a valuable case study for investigating neighborhood integration into cities, due to a clear comparative temporal threshold (before and after incorporation). This presentation explores how a small community transitioned into a low density urban neighborhood in a larger city, and how the local elites at its apex transformed into intermediate elites in an emergent three tier political system. The Late-Terminal Classic (AD 700–900) Maya polity of Lower Dover, Belize offers potential for examining this issue because the center arose in the midst of several long-established, Middle Preclassic (1000–400 BC) communities. This presentation identifies the ways in which the lives of the inhabitants of the Tutu Uitz Na neighborhood changed during the Late Classic as it transitioned from an autonomous community to become amalgamated into a polity. A focus on the changing wealth, status and behavior of inhabitants permits an understanding of how the neighborhood became incorporated politically, economically, ritually and socially.

[332] *Phase III Investigations of Three Archaeological Sites at Stillwell Crossing, Fort McCoy, Wisconsin*

In summer of 2017, CEMML archaeologists at Fort McCoy, in Tomah, Wisconsin conducted Phase III investigations of three NRHP-eligible sites 47MO054, 47MO360, and 47MO660 near a tank trail crossing Stillwell Creek. This location was continually re-occupied for the last 3,000 years, by Late Archaic to historic-era Native American (probably Ho-Chunk) communities. Bioturbation, military activities, and other cultural and natural processes easily disturb the sandy soils at Stillwell Crossing, resulting in substantial mixing of the archaeological components, so the Phase III research design tested two questions: 1) How effective is subsurface geophysical prospecting in such contexts? and 2) How do spatial distributions of artifacts reflect both depositional and post-depositional processes at the site? Investigations demonstrated that the effectiveness of geophysical prospecting is limited, especially for identifying ephemeral pre-contact features. Vertical distribution of artifacts showed no distinctly stratified deposits, though horizontal distributions of lithic raw material varied across the three sites. Mineralogical analysis of soil samples, radiocarbon dates, and compositional analysis of a glass trade bead all yielded informative results about the extent and nature of past human activities at Stillwell Crossing. These mitigation efforts, which also included construction of a mock cultural site, enhance the military training facility at Fort McCoy.

[157] *Investigating the Spatial Analysis of Chultuneob at Mul Ch'en Witz, Belize*

Mul Ch'en Witz (Hill with Many Caves) was first excavated in the summer of 2017 by the Contested Caves Archaeological Project (CCAP), a subproject of the Three Rivers Archaeological Project (TRAP). The area, located just below the escarpment on which the core architecture of the ancient site of La Milpa, Belize is situated, was chosen for excavation because of the high density of chultunes encountered within a restricted area. The chultunes have similar entrance styles and diameters, and five of the six investigated were located less than ten meters apart and display a strong north-south alignment. This poster will discuss the relation of the Mul Ch'en Witz chultunes to other landscape and architectural features at La Milpa and will advance preliminary inferences of these relationships.

[137] *The Future of Paleogenomics in Archaeology: Insights from a Multidisciplinary Study on Sunflower Domestication*

Ancient DNA (aDNA) methodologies have rapidly developed over the past three decades, and today these tools provide a powerful means to investigate a wide range of archaeological inquiries, including human evolution, animal and plant domestication, and paleoenvironmental reconstructions. In this talk, I will summarize general approaches in paleogenomics research, focusing on concerns and questions from archaeologists.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

To demonstrate how state-of-the-art paleogenomic techniques can contribute to archaeological research, I will present new research on sunflower domestication that integrates aDNA, radiometric dating, and archaeobotany. Given the speed at which genomic technologies are becoming more cost effective, I will conclude with predictions about the future of paleogenomic research and offer suggestions for how aDNA studies can be integrated into archaeological research programs.

[258] *A Middle Classic Horizon? Tracking Calakmul's Rise in the Ceramics of the Central Karstic Uplands*

Joe Ball's seminal work on the ceramics of Becan, Campeche, Mexico, anchored two generations of research on the ancient Maya. His analysis, for the most part, has stood the test of time, and his recent revisions to it reflect the breadth of his knowledge, and his ability to re-conceptualize a problem in light of subsequent research.

One aspect of his Becan work that has proved elusive to other researchers is the definition of a Middle Classic. Although some have isolated a Middle Classic component similar to Ball's Sabucan Complex, most find the period problematic. The recent identification of Middle Classic Macanxu Group ceramics in stratified residential debris at Yaxnohcah is described here, in the context of an expanding Calakmul polity.

Walker, John (UCF Department of Anthropology)

[333] *Donald Lathrap, the Tropical Forest, and Hemispheric Archaeology*

Donald Lathrap was a visionary anthropologist and archaeologist. His contributions always reflected the "big picture": an understanding that all pre-Columbian culture history was intertwined, and that these connections went back through time to origins in the lowland tropics, or the Tropical Forest. He practiced an archaeology that gave equal weight to iconography and religious thought, and rim sherds and energetics. The most significant issues for Lathrap's version of American Archaeology, is not an argument over the significance of the Amazon Basin in comparison to the Andes, or as a center for cultural innovation. The legacy of Lathrap is Hemispheric Archaeology, that there are deep cultural-historical connections across the Americas, particularly between the Andes and the Amazon that have explanatory value. The big picture is relevant both for maize farmers in the Mississippi Valley, tuber gardeners in the Pacific Northwest, and raised field builders in the Southwest Amazon. Such hemispheric explanations could be just-so-stories, but correcting for this danger is worth the effort, because as the evidence for earlier developments continues to accumulate, the big picture is getting bigger.

[135] *Archaeological Shoreline Monitoring in a Climate-Changing SW Florida: The Case of a Rapidly Eroding, Rare, Late-Archaic Shell Midden at Calusa Island*

There are only a very few Archaic period sites in the Charlotte Harbor/Pine Island Sound region of southwest Florida. One of these, composing a large portion of Calusa Island, is an oyster-shell dominated midden. According to a landowner, since ca. 1973–1974 the site has suffered a horizontal loss of 11 m along parts (if not all) of its 80+meter, eroding archaeological shoreline. Based on a 1944 aerial photograph, it is likely that as much as 28 m has been eroded away. We began a monitoring program at this site in April of 2016, and in July began partnering with the Florida Public Archaeology Network's Southwest and Southeast regional archaeologists to assist and then continue the work. We describe our initial, simple method, its problems, and the improvements made by our FPAN colleagues. Currently, FPAN incorporates Calusa Island's monitoring into its statewide program which is, in large part, staffed by citizen volunteers who visit and re-visit sites in jeopardy and report their observations.

Walker, Martin (University of Tennessee, Knoxville) and David Anderson (University of Tennessee, Knoxville)

[35] *Examining the Subsistence and Social Landscapes of the Late Precontact Occupations at the Topper Site (38AL23), Allendale, South Carolina*

The Late Woodland to Early Mississippian transition within the Atlantic Coastal Plain is characterized by widespread and dynamic changes from more dispersed and politically decentralized organizational practices into highly centralized, stratified, and complex sociopolitical organization. This period also experiences changes in both hunting technologies and horticultural food production. The timing of the linkages among these developments are not well established locally, something that this project hopes to remedy. Three field seasons directed to the extensive Precontact occupations at the Topper site (38AL23), Allendale, South Carolina, have documented hundreds of features and a rich material record dominated by cross-cord-marked pottery and small triangular arrow points, as well as the widespread presence of maize. What was occurring on the site and when it occurred is the subject of a suite of specialized analyses, which are helping to reshape thinking about late prehistoric occupations in the central Savannah River Valley, and on a site formerly best known for its extensive Paleoindian archaeological record.

[16] *Regional Analysis in Perspective: An Epistemological Assessment for Paleo-Inuit Archaeology*

The increasing accessibility of archaeological data from the Canadian Arctic has promoted a recent influx of macro-scale analyses. Drawing insights from our ongoing research project in the Foxe Basin region, we address some challenges regarding the synthesis of archaeological information, especially as it pertains to Paleo-Inuit studies. We discuss the importance of data quality and address issues of variability in occupation density, duration, and seasonality, both at the household and community levels. We propose potential solutions to these challenges. First, a relational bottom-up approach that utilizes multiple social scales of analysis in a fluid and continuous way, moving from household identities to the region-wide synthesis of archaeological activity. Second, the integration of both remote sensing and traditional ground survey technologies provide higher resolutions of analysis for local scales. It is subsequently evident that macro-scale approaches to Paleo-Inuit archaeology require a re-evaluation of both household and community contexts and chronologies prior to regional analysis.

[218] *Prophets of the Ancient Southwest*

How do prophecy and new religious movements impact life histories of artifacts and architecture? Ethnographic evidence indicates that prophets realize their visions, in part, by transforming relationships between people and material objects. They shun, embrace, or reorient technologies, artifacts, and architecture. Not surprisingly, in cultures where spiritual forces already animate artifacts and architecture, such reorganizations can produce dramatic changes in material culture. Much of the revitalization and crisis cult literature has logically focused on the role that colonialism played in creating new religious movements. Prehistoric contexts, however, exhibit a broader range of underexplored contexts such as environmental stress, disease, and war. The ethnographic and historical records of the American Southwest suggest revitalization movements extend far into the past. We

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

argue that widespread changes in material culture associated with significant inflection points in southwestern prehistory (circa A.D. 700s, 1000s, and 1300s) document the work of ancient prophets.

[89] *Cut Marks and Decaying Bodies: An Experimental Study*

It has been suggested that cutting into decaying bodies occurred in the past, for instance during the cleaning or dismemberment of corpses during protracted funerary rituals. However it can be difficult to confirm the timings of such interactions, particularly for secondarily deposited bones. An experimental study was therefore conceived to test whether the frequency, location and micro-morphometric characteristics of cut marks might differ on fresh compared to decaying bodies. In order words, whether cut marks can be used to verify the stage of carcass decay. Incisions were regularly made into pig body parts as they decomposed over a period of three months. For metric evaluations of the experimentally produced cut marks, Focus Variation Microscopy was used. The effects of different hand pressures and different tools were also studied. Our results show that micro-morphometric analyses of cut-marks have the potential to enable the timing of cutting to better hypothesized with regards to defleshing and disarticulation practices in the past.

[159] *History on the Edge: Loss of the Ocean State's Past*

Hurricane Sandy impacted Rhode Island's south coast on October 29, 2012. Storm surge and wind-driven waves eroded considerable sections of the shore damaging historical and archaeological sites located at the contact between the land and sea. Emergency response and preservation planning archaeological surveys conducted in response to Hurricane Sandy represent the first large scale, systematic attempts to identify and evaluate vulnerable archaeological sites situated along the Rhode Island coast. These surveys also underscored the long-term threats that rising seas and future tropical storms pose to ancient, as well as, more recent cultural deposits. Continued erosion of the Rhode Island shore imposes current and future financial and logistical challenges to preservationists wishing to preserve the Ocean States' unique maritime history.

[97] *Ancient DNA Investigations of Possible Casas Grandes—Chalchihuites Interactions*

Paquimé, the political and religious center of the Casas Grandes culture, demonstrates extensive evidence of Mesoamerican influence, including macaws, architectural characteristics such as ballcourts and platform mounds, and mortuary practices in the form of modified trophy skulls and human sacrifice. The role of Mesoamerican influence on the development and florescence of the Casas Grandes culture remains an important but contentious research question for the late prehistoric Northwest/Southwest. While there is general agreement that some degree of Mesoamerican interaction occurred, the sources of this interaction, and their significance, remain an open question. In this study, we compare mtDNA haplogroup and sequence data from Paquimé to a series of Southwestern and Mesoamerican samples. The results suggest that samples from the Chalchihuites region of Durango, Mexico, are more similar to Paquimé than geographic distance would suggest. We conclude by discussing the potential role of the Chalchihuites culture in the spread of Mesoamerican traits into Chihuahua and the US Southwest.

[87] *Child Disability and Prostheses in Nineteenth-Century Britain*

Introduction of dedicated paediatric medicine, was an advancement arriving in Britain late compared to its neighbours such as France's 'Enfant Malades' in 1802. Paediatric hospitals were a consequence of physicians' financial aspirations rather than falsely portrayed 'community need' (Lomax, 1998). Their establishment contradicted longstanding attitudes surrounding children as 'incomplete beings...whom it was wasteful to devote attention to' (Porter, 1989). Oddly, amputation saw children harness the same attention as adults, and despite being overused, crudely performed with poor survival rates and aftercare, evidence exists of child amputees surviving into adulthood and of child prostheses. This paper will discuss complicated beliefs surrounding paediatric care in nineteenth-century Britain, concentrating on archaeological evidence of prostheses available for juvenile amputees. It asks why, in a society with poor paediatric care, was amputation and prosthesis provisioned for? What sparked the changes to children's healthcare which saw institutions such as Great Ormond Street Hospital, London, introduced in 1852? Analysis of Victorian prosthetic devices and medical procedures will help demonstrate that whilst children occupied the role of 'society's future', lingering attitudes, contributed to high infant mortality rates, overcrowded workhouses and an enduring class system. However, medical improvements and enlightenment, created an optimism, triggering a re-evaluation in paediatric healthcare.

[9] *Pots and People in Motion in Woodland Period Florida*

Populations across northern Florida during the first millennium CE were highly interconnected as evidenced by shared patterns of mortuary practices, material culture, and settlement patterns. Social networks evidently were predicated on common ritual practices that found purchase in diverse and far-flung communities, especially those associated with "Swift Creek" and "Weeden Island" archaeological cultures. Through time, and with an expanding suite of religious practices and paraphernalia, populations across the region became increasingly aggregated in villages and possibly exhibited differentiated social status. Did Woodland period religious movements fuel village aggregations and incipient social inequality?

We test these apparent correlations through a multifaceted study of nearly a dozen burial mound assemblages from across northern peninsular Florida,

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

seeking to infer patterns of human mobility, social interaction and community formation in the context of mortuary rituals. Isotopic analysis of skeletal populations are combined with demographic and life history information from individual secondary interments to model patterns of diet and mobility. Neutron Activation Analysis of pottery, compared with data from clays across the region, is used to source ornate mortuary wares. Results indicate that frequent transport of mortuary pots and possible integration of disparate populations were fundamental to religious expansion and social change.

[130] *Beyond Research Design: Digital Resource Management for the Next Generation*

Digital technologies in the field of archaeology have often been promoted as a tool enhancing productivity and efficiency, usually implying that the immediate digital recording of data would allow for the excavation of greater volumes and covering larger areas. Moreover, the strength of Paperless Archaeology comes with the enabling of immediate dissemination of observable data while breaking up the 'sealed' relationship between the raw data and the First Interpreter.

What remains less addressed, however, is the long-term impact of digital recording. Because field projects often last several decades, there is a large gap between the initial methodological outlay and research design on one hand, and the final publication on the other. The true value of such digital resources becomes apparent only with the need of contextualizing and illustrating large volumes of artifacts, architectural or skeletal remains and other types of archaeological data, many years after the initiation of an archaeological project. The authors will use the example of the current Pylos excavations in Greece to emphasize the collection, storage, and dissemination of an avalanche of digital information with an emphasis on the integration of a complex database design, Geographical Information Systems (GIS), photogrammetry and aerial photography.

[32] *The Current State of Egyptology: An International Survey and Discussion*

This paper suggests that Egyptology has reached a critical juncture in which the opening of the field to other areas, such as anthropology and sociology, is critical in revitalising and safeguarding the future of the discipline. Discourse beyond disciplinary boundaries is becoming increasingly important in academia, due to wider changes in university structures, employment, and funding opportunities. Given the current importance of these issues, the authors wanted to determine how these aspects have impacted the identities, research, and careers of those who are currently entering the discipline. The authors designed and implemented an international survey to gauge the current state of Egyptology from the point of view of PhD students and early career researchers. The aim of this survey was to determine how these individuals perceived the scope and role of Egyptology, its prospects as a discipline, its integration in the humanities and social sciences, and the role of their own research and experience. The survey results are discussed alongside the authors proposal that a more reflexive Egyptology, one that engages critically with other disciplines, is needed to help reinvigorate the field and open new lines of enquiry for future research.

[118] *A New Methodology for Archaeological Investigation of Human Activity in Space: The International Space Station Archaeological Project*

Our project is the first major archaeological study of a space habitat: the International Space Station. It is a locus of intercultural interaction at the level of both individuals and states, "a micro-society in a miniworld" (National Academy of Sciences 1972).

Remoteness and cost are obstacles to employing traditional archaeological techniques in Earth orbit, so we are developing new methodologies. Chief among these is the use of the millions of images generated by space agencies showing life onboard the station. We will classify the associations between objects, spaces, and crewmembers by cataloguing them from the images into a database, indexing them for time using the images' metadata. The enormous number of images makes classification by human researchers time- and cost-prohibitive. We are exploiting recent advances in machine-learning algorithms and crowdsourcing for classification of non-machine-readable data to solve this problem.

Ultimately, we will be able to choose any moment and study the station's development and occupation. We can then map changes in the function of spaces, or the associations of people and objects with particular spaces, over time. Such insights into how crew members adapt to the microgravity environment have never been available before, and have applications for future mission design.

[292] *Multiple Ways of Understanding Peru's Changing Climate: Bridging Ethnographic, Archaeological, and Other Scientific Perspectives in Student Learning*

This paper discusses the importance of combining ethnographic, archaeological, and "hard" scientific knowledge when teaching about climate change. Archaeology courses that discuss climate change typically bring together data from the physical sciences, such as from ice or lake cores, with archaeological evidence of social change, such as shifting settlement patterns or food strategies. Though an understanding of these links is critical to scientific literacy and knowledge about the past, we suggest that an ethnographic perspective can deeply enrich student learning by revealing social processes beyond subsistence-based adaptations. Drawing on ethnographic fieldwork conducted in rural communities in Peru, we first review how local people perceive the causes and effects of climate change, including through the lens of religious belief. Second, we draw on archaeological and available ice core evidence from the region that reveal how ancient people adapted to shifting flows of water: an ongoing process that continues today. Ultimately, we suggest that the diverse kinds of knowledge that ethnography, archaeology, and paleoclimatology produce—and the multiple ways of knowing the world that each provides—is essential for students to consider when learning about not only what happened during moments of climate change in the past, but how societies creatively responded.

Wandsnider, LuAnn (University of Nebraska)**[241]** *Heritage Enhances Resilience?: The Solomon Butcher History Project of Custer County, Nebraska*

Solomon Butcher was a citizen photographer smitten with what he referred to as the "history project," to photodocument the citizens of Custer County, Nebraska as the frontier receded further west. From 1886–1892, he imaged perhaps one third of the occupants, staging them in front of occupied or recently abandoned sod houses and making them party to his commemoration of a constructed pioneer heritage. When severe droughts hit in the mid-1890s, did this shared pioneer "can-do" heritage sustain Custer County residents? I report on a comparative analysis addressing this question.

[200] *Discussant***Wang, Jiajing****[284]** *Making Plant Foods in the Early Neolithic: Microbotanical Evidence from Shangshan Pottery*

The Lower Yangtze Valley of China is renowned for the origin of rice agriculture. Previous research based on archaeobotanical analysis and genetic data indicates that the evolution from wild rice to domestic rice was a continuous process that occurred between 11,000—6,000 BP. The Shangshan culture (11,400 BP—86,00) has revealed the earliest evidence of rice cultivation in the region and abundant pottery vessels. These vessels are diverse in form but their functions still remain unclear. By applying starch analysis on different types of Shangshan pottery, this presentation explores how plant foods were made and their associated social activities. By integrating plants into the social organization of human life, this study aims to develop an explanatory model to better understand the transition to agriculture in the Lower Yangtze.

Wantschik, Magdalena [15] see Crews, Christopher

Ward, James (University of Central Lancashire) and David Robinson (University of Central Lancashire)**[214]** *Sonic Landscapes, Past and Present: An Archaeoacoustical Study of Pleito*

Located on the Wind Wolves wildlife preserve in South Central California, there are several spectacular rock art sites. Created by the Native Californians who inhabited the landscape, they have been the focus of a number of studies over the years, but none of these studies concentrated on the sound quality of these spaces. The correlation between the placement of rock/cave art, and the acoustic properties of the space in which it is found, is increasingly being studied under the rubric of 'archaeoacoustics'. In this study, we employ both 'standard' and novel approaches to the study of the spectacular painted site called Pleito (CA-KER-77). This paper details the methodology and results of the 'standard' method, which employs a sine sweep and impulse analysis in order to determine the sonic properties of the local landforms in relation to where the art was placed. More importantly, a frequency response analysis of a traditional song performed by a member of the local Tejon Indian illustrates the deep importance of sonic landscapes within contemporary Native society.

Warinner, Christina [143] see Mann, Allison

Warmlander, Sebastian (Cotsen Institute of Archaeology, UCLA)**[46]** *Three Case Studies of Andean Metalworking*

The history of South American metalworking still presents a number of unresolved questions, despite decades of archaeological and historical research. This is especially true for the Andean region, where in prehistoric times alloys of copper as well as precious metals were crafted into intricate objects. Here, analytical metallographic techniques such as scanning electron microscopy (SEM), X-ray diffraction (XRD), and infra-red (IR) spectroscopy are used to investigate different aspects of Andean metalworking in three case studies. The first study investigates the technology used to produce gold wire in the pre-Columbian Quimbaya culture (Colombia). The second study concerns Inka period copper and silver production in the Tarapacá valley in northern Chile. The third study characterizes the composition, manufacture, and deterioration of metal embroidery from Chilean and Peruvian church objects dating to the colonial period. The broad geographic and temporal range of these case studies illustrates the diversity of the outstanding research questions of South American archaeometallurgy.

Warnacutt, Camille [39] see Myster, James

Warren, Matthew (University of Texas at San Antonio)**[257]** *Inka Colonialism without Inkas: Uncovering the Role of Lowland-Affiliated Populations in the Consolidation of the Eastern Andean Frontier*

As the Inkas expanded their imperial hegemony over the valleys of the eastern Andes, their armies fought and then forged political and military alliances with the various cultural groups comprising the Charkas confederacy. While the Spanish chronicles and local ethnohistoric sources attest to these events and to the important role the local indigenous populations played in Inka colonization efforts along the eastern imperial frontier, they are all curiously silent on another important population which inhabited the eastern Andean valleys into the Inka period. Abundant archaeological evidence from the Inka site of Pulquina Arriba and surrounding settlements demonstrates that the earliest settlers of this region had arrived not from the altiplano, but instead from the eastern tropical lowlands. Further, instead of being administered by Inka elites, Pulquina Arriba seems to have been inhabited by a combination of Charkas- and lowland-affiliated peoples. As such, this seems to represent a case in which a historically unacknowledged indigenous population was nevertheless critical to the success of imperial activities and administration in a critical frontier region. At least within the loosely incorporated easternmost Andes, a strategy of "Inka colonialism without Inkas" seems to have represented a viable means of imperial expansion and colonization.

Waters, Christopher (Syracuse University) and Anthony Tricarico (University of South Florida)**[208]** *Socio-spatiality of an Antigua Plantationscape*

Caribbean Sugar production during the 18th and 19th centuries expanded rapidly, fueled by increasing proletariat consumption across the globe. In response, sugar planters in 18th century Antigua, West Indies, deforested over 90 percent of the landscape, carving the island into proto-industrialized plantations defined by sugarcane monoculture and labored by enslaved Africans. New World plantation organization was once ascribed as a balance between profit and surveillance: simultaneously maximizing control over the landscape and enslaved labor. However, evidence from Antigua questions aspects of these earlier notions. This paper examines the socio-spatiality of the late 18th century Antigua plantationscape. Specifically, this research builds upon the analysis of Bates (2015) in Jamaica and Nevis, conducting a diachronic and synchronic analysis of seven different plantations in Antigua owned by the Codrington family, including Betty's Hope [1655–1944], New Works [before 1710], Cotton Estate [before 1710], Tuitts Estate [before 1750], Rooms Estate [1717–1852], Clare Hall [1814–1848 (at least)], Jennings Estate [1772–1815], and Bolans Estate [1772–1815] to determine whether plantation layout sought to maximize profit or surveillance. Our research shows that Antigua plantations underwent several transformations aimed at profit extraction at the expense of surveillance, reflecting a much more heterogeneous 18th century island landscape.

Waters, Michael (Texas A&M University) and Jessi Halligan (Florida State University)

[78] *Page-Ladson and Submerged Late Pleistocene Sites along the Aucilla River, Florida, and Their Importance to First Americans Archaeology*
Late Pleistocene terrestrial archaeological sites now lie submerged in the karstic river systems of Florida. Nowhere is this more apparent than along the Aucilla River where dozens of inundated prehistoric sites are known. One of the most important sites is Page-Ladson, which has yielded some of the earliest unequivocal evidence for pre-Clovis occupation in North America, dating back to 14,550 cal yr B.P. At that time, sea levels had fallen approximately 100 m and people utilized a pond in the bottom of a sinkhole that was located ca. 250 km inland from the coast. Subsequent sea level rise slowly submerged the site, 4 m of sediment buried the site, and the sinkhole became part of the Aucilla River channel. This scenario was repeated at multiple sites, creating a rich underwater record of archaeological sites dating to the Late Pleistocene in Northwest Florida. These submerged sites are critically important to First American studies because they occur in a secure geological context that can be dated by the radiocarbon method. Further, floral and faunal remains are well preserved at these sites which can provide detailed paleoenvironmental records related to climate change and megafaunal extinctions.

[107] *Ethics, Epistemology and Multiple Consciousness: Some Considerations*

This paper centers the ethical epistemology (EE) of the New York African Burial ground—as well as the scholar-activist traditions that informed it—in this important session discussion on ethics. I argue that both are overlooked resources for conceptualizing and operationalizing an ethics of multiple consciousness such as the one that the organizers propose. The intellectual and political work associated with the EE of the New York African Burial Ground Project is discussed along with the specific structural inequalities to which it responds. The recent application of the New York African Burial Ground's ethical epistemology to a case involving real estate development and the desecration of an African American burial site in Washington, DC is also discussed. The historical, social and political factors involved in both the New York African Burial Ground and the local cemetery case lead to 2 important conclusions: 1) developing an ethics of multiple consciousness must involve a critical examination of both our research practices and researchers as social actors; and, 2) the social and contemporary relevance of our research is both an intellectual and moral imperative.

Watkins, Tia B. (Northern Arizona University) and John Walden (University of Pittsburgh)

[40] *A Comparative Spatial Analysis of Ancient Palaces*

Ancient palatial complexes offer opportunities to understand the actors at the apex of prehistoric polities. With careful and complex design, these structures were built to represent the affluence of those who resided within their confines. While the external façade of a palace represents the defining barrier between the elite and the public, the architectural layouts of ancient palaces reveal multiple levels of exclusivity. The varying levels of privacy in different palaces may relate to the differing roles and functions that palaces fulfilled across the ancient world. In some contexts palaces were simply a grandiose residence for the ruling elite, whereas elsewhere they fulfilled political, religious, administrative, economic and military functions. Furthermore, the accessibility of the inner areas of palaces might reflect the gulf between rulers and subjects, or the overall safety of the elite. We apply a space syntax analysis to several ancient palatial complexes to measure privacy and accessibility. We compare the results to identify patterned variability in the level of restriction between palaces, which might be structured by the presumed function of the palaces (military, economic, religious, residential, and administrative), the broader bases of political power in the society, or the level of societal complexity.

[116] *From the First to the Last Amazonian Dark Earths: The Longue-Durée of Landscape Management at the Teotônio Site, Upper Madeira River, SW Amazonia*

The Teotônio site, situated on the right bank of the Madeira river near Porto Velho, Rondônia, is a key location for understanding the deep history of human-environment interactions and landscape management in southwest Amazonia. Its archaeological record stretches back to the early-mid Holocene and includes vestiges of 6,000-year old Amazonian Dark Earths (ADE) belonging to the Massangana Phase, hypothesised as marking the beginning of widespread landscape transformations in the Upper Madeira region. From around 3,000 BP, more intense occupations are visible with the arrival of ceramic-producing groups, while the accumulation of darker ADEs packed with ceramics from ca. 1,000 BP may reflect a peak in site occupation during this period. In this paper, we present new data from on-site and off-site archaeobotanical and palaeoecological analyses currently underway at Teotônio and discuss their preliminary implications for subsistence, land use and climate-vegetation dynamics throughout the site's rich history.

Watrall, Ethan (Michigan State University)

[215] *Towards an Approach to Building Mobile Digital Experiences for Campus Heritage & Archaeology*

The spaces we inhabit and interact with on a daily basis are made up of layers of cultural activity that are, quite literally, built up over time. While museum exhibits, archaeological narratives, and public archaeology programs communicate this heritage, they often don't allow for the kind of interactive, place-based, and individually driven exploration so often craved by the public. In recent years, many archaeological projects, cultural landscapes, and heritage institutions have turned to mobile technology to help address these challenges.

It is within this context that this paper will explore a deeply collaborative effort at Michigan State University that leverages mobile technology to build an interactive and place-based interpretive layer for campus heritage and archaeology. Driven by the work of the Campus Archaeology Program, these efforts have unfolded across a number of years and evolved to meet the ever changing need to present the rich and well-studied heritage and archaeology of MSU's campus.

Ultimately, the goal of this paper is not only to present and discuss the efforts at Michigan State University, but to provide a potential model for other university campuses interested in leveraging mobile technology to produce engaging digital heritage and archaeology experiences.

[34] *Martha's Vineyard Beach Economy: Scavenged Seals and Washed-up Whales at the Frisby Butler Site*

Marine mammals, including whales and seals, were a source of meat, blubber, baleen, and bone to the settlers of Martha's Vineyard from the earliest occupation until the historic period. Numerous species of whales have been observed in New England's shallow waters, including migratory species

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

like the North Atlantic Right Whale (*Eubalaena glacialis*) and other marine mammals like the Harbor seal (*Phoca vitulina*). During the 17th and 18th centuries, the Wampanoag on Martha's Vineyard and neighboring islands negotiated drift whale rights with the English, reserving claims to dead whales on sold lands, particularly along the southwestern coast. Stranded whales were also trapped and driven ashore at nearby coasts.

In this paper, the role of drift whales and other beached finds is assessed at the Frisby Butler site, located along the southwestern shore of Martha's Vineyard. Marine mammals account for less than 1% of the total assemblage but represent at least four separate species. How can we explain the diversity of these taxa at a site otherwise focused on deer and inshore fishing? In particular, this research questions whether infrequent whale bones are indicative of scavenging drift whales, offshore hunting, or perhaps dispersed trade practices.

Watson, Rachel (Louisiana Division of Archaeology)

[231] *Can You Make Me a Map? Making Louisiana's Cultural Resources Records Accessible*

This paper will outline the processes and decisions that the Louisiana Division of Archaeology made to create an efficient, comprehensive GIS system that could be utilized by both professionals and the citizenry of Louisiana to help promote both progress and preservation. I will discuss how we partnered with La Department of Transportation & Development, La Governor's Office of Homeland Security & Emergency Preparedness, the New Orleans Corp Engineers, and the Federal Emergency Management Agency to fund the project. Furthermore, I will discuss how we handled gaps in data and converting paper files into a digital format. Finally, I will outline future endeavors to raise public awareness of Louisiana's rich cultural history utilizing open access maps, story boards, and applications for smartphones and tablets.

Wattenmaker, Patricia (University of Virginia)

[170] *Wealth Building in Early Urban Mesopotamia: Strategies and Ideologies*

Stratified occupational remains at mounded sites of third millennium Mesopotamia afford a temporal perspective on houses and institutions, as well as fluctuations in their resources. This paper draws on such data to evaluate the ways that houses and institutions accrued wealth and enhanced inequalities. Evidence for the production, circulation and storage of food and craft goods in early Mesopotamia informs about the kinds of resources used for wealth building, the processes through which goods took on value, and the role of risk in resource accumulation. Findings provide the basis for assessing the value and limitations of anthropological approaches to monetary economies in understanding resource accumulation and exchange networks in early urban Mesopotamian societies.

[271] *Diachronic and Spatial Perspectives for Exploring the Ethnogenesis of Afro-Andean Populations in Southern Coastal Peru*

Ecclesiastical records suggest that the Ingenio Valley in Nasca's northern Rio Grande Drainage has been defined by a predominantly black population since the early 17th century, most of whom worked as enslaved laborers on the two large Jesuit wine haciendas and a number of smaller secular estates in the valley. In this paper I approximate Afro-Andean ethnogenesis in the coastal valleys of Nasca from multiple temporal and spatial scales, considering both historical documentation and archaeological evidence. A close examination of documentation across the subsequent two centuries opens a window onto the complexities and contradiction of mapping casta categories onto the valley's social geography. Archaeology offers a means to explore slave-dominated spaces on the Jesuit wine estates and the production of an hacienda aesthetic which contentiously incorporated a host of African, European, and Andean signs, revealing of both dissensus and social cohesion among the heterogeneous enslaved and free Afro-Andean hacienda population.

Weber, Sadie (Harvard University)

[249] *Pulling Abundance out of Thin Air: The Role of Pastoralism in 1000 BC Peru*

Andean camelid pastoralism—with its origins in the puna of the South-Central Andes—plays a key role in risk management and transformation of low-energy, high-abundance resources. Camelids not only help pastoralists mitigate risk by acting as literal “wealth on the hoof,” but they also maintain cohesion of intergroup relationships across vast distances by facilitating mobility within and among diverse environmental zones. Here, I examine intensified camelid pastoral systems as an adaptation to scarcity in the Andean highlands. I employ a multiproxy analysis including zooarchaeology, microbotany, and stable isotopes to examine the extent to which intensified pastoralism was key in proliferating the widespread cultural phenomena we see in the highlands at approximately 1000BC in the Central Andes. I propose that environmental wealth—or a lack thereof in some areas—at 1000BC prompted an intensification economic and cultural systems that were heavily dependent on pastoralists.

[296] *Intersectional Irish Identity and the Rise of Globalization*

Archaeologists have long struggled with assigning specific artifacts to particular ethnic identity categories. This paper uses the artifacts of the nineteenth-century rural Irish poor to argue that identity is best considered intersectionally, in which questions of ethnic or national identity are combined with class, gender, religion, and other identity categories. This intersectionality becomes increasingly important for archaeologists to consider with the rise of globalization, in which mass-produced objects originating from production centers both near and far are used to construct identities.

[258] *Becan Reconsidered*

Joe Ball's early career centered strongly on Becan, which during the early 1970's figured prominently in many interpretations of Classic Maya society and culture history. The initial Becan research predated our effective understanding of Maya inscriptions, the large-scale conflicts and alliances that affected the southern lowlands, and also the now-widespread data for climate change and the Classic “collapse”. Because of its lack of inscriptions Becan has been unfortunately marginalized or ignored in the later literature on these topics. Reconsideration of its significance on the Maya political and agrarian landscape is long overdue.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Webster, Jane (Newcastle University (UK))**[308]** *From Rome to Charleston: A Comparative Perspective on the Archaeology of Forced Migration*

My title is borrowed from a groundbreaking volume of papers published in 1997. Eltis and Richardson's *Routes to Slavery: Direction, Ethnicity and Mortality in the Transatlantic Slave Trade* marked the first flowering of a hugely ambitious project to synthesize archival data on known Transatlantic slave trading voyages from ca. 1500–1900. The resultant database is now widely used by archaeologists in both Africa and the Americas. But there were many other routes to slavery in different times and in other places: not least the many routes which brought millions of enslaved persons to ancient Rome and its provinces in the Classical era. Can archaeological work on forced migration, ethnicity and ethnogenesis in the early modern world really inform research centered on the Roman Republic and Empire? Yes it can, as this paper aims to show. Moreover, diachronic comparison—and the nuanced methodologies which underpin the archaeology of the Diaspora in the Americas—could provide the (far less developed) archaeology of Roman slavery with a new road map for the identification of the unfree, and recovery of their life experiences.

Webster, Laurie (University of Arizona)**[218]** *Cotton as Commodity in the Prehispanic Southwest*

With its strong symbolic reference to moisture and clouds, cotton has long been considered a precious textile fiber in the Americas. Adopted from Mexico as a tropical crop, it was well-established in the Salt-Gila drainage by 500 A.D., and by 1000–1100 A.D. it was adapted to the wetter microenvironments of the Colorado Plateau. Because cotton could not be grown everywhere, it became a prized element of trade and craft specialization. In this paper I examine the agricultural intensification, commodity production, and exchange of cotton and cotton textiles in the prehispanic Southwest with a focus on the Western Pueblos, including the important Homol'ovi villages.

Wedemeyer, Rachael, Arthur Joyce (Advisor), Jeffrey Brzezinski (Colleague) and Sarah Barber (Colleague)**[9]** *Fragments of Identity: A Comparative Study of Terminal Formative Figurines from Coastal Oaxaca, MX*

The Terminal Formative period (150BCE-250CE) in Coastal Oaxaca, Mexico was a time of urbanization and increasing political interaction. The Terminal Formative included the emergence of an urban center at the site of Río Viejo, which may have extended political influence over surrounding communities. During this period, on the coast of Oaxaca, ceramic figurines were a ubiquitous medium for expression and identity in political/cultural exchanges. By comparing ceramic figurines from the site of Río Viejo, a primary center, to Cerro de la Virgen, a secondary community, relations between these two communities can be better understood. Through both qualitative and quantitative analyses, including INAA, much can be postulated about the manufacture and use of the ceramic figurines. The figurines from both sites have proven to be diverse in their iconography as well as sharing many other aesthetic similarities. With Terminal Formative figurines here some iconographic trends that seem to exist as categories such as anthropomorphic and zoomorphic, which are expressed by a number of well-preserved artifacts. The ceramic figurines have also proven to be diverse in their use: some are musical instruments, some are able to stand, and others were able to be worn.

Wegner, Paul (Institute for American Indian Studies)**[203]** *Connecticut's First Fishermen: The LeBeau Fishing Camp*

Located on the Quinebaug River, the LeBeau fishing camp and weir is the oldest known weir in Connecticut. Approximately 8,700 artifacts were recovered from the site, primarily lithic tools made from locally sourced materials such as quartzite. These tools indicate the specific activity of fishing and processing. Diagnostic artifacts recovered from the site indicate that it was utilized by indigenous people over the course of thousands of years, from the Middle Archaic to the Early Woodland.

Among the site's notable features is the presence of the diagonal weir, which is particularly useful compared to the traditional V shaped weir. This pattern allows for trapping activities to take place at lower water levels along the shore, whereas the V pattern concentrates the actions on the deeper, center portions of the waterway.

This presentation will explore not only how the LeBeau site differs from other fishing sites found throughout Southern New England, but also how its artifacts provide a unique window into the past and how Native American people utilized the Quinebaug River as part of their seasonal subsistence strategy. And why these unique features included it to be listed as a State Archaeological Preserve.

Weik, Terrance**[271]** *Discussant***Weinberg, Camille (University of Texas at Austin), Jo Osborn (University of Michigan), Rachael Penfil (University of Illinois at Chicago) and Kelita Pérez Cubas (Pontificia Universidad Católica del Perú)****[240]** *New Evidence of Late Intermediate and Inca Occupation at Jahuay, Quebrada de Topará, Peru*

Located at the mouth of the Quebrada Topará on the Peruvian South Coast, Jahuay is a multicomponent site key to understanding the rise and spread of the Topará cultural tradition—and the Paracas decline—during the Early Horizon. Limited systematic archaeological work in the mid-20th century defined Jahuay as the type-site for Topará ceramics, and also reported the existence of tombs on the site's upper terraces that were initially dated to the Late Horizon (AD 1450–1532). However, 2017 investigations revealed the existence of a previously unreported Late Intermediate (AD 1100–1450) and Late Horizon occupation at Jahuay's beachside edge. Although this sector has been severely damaged by both human and environmental forces, we recovered well-preserved material culture, including ceramics, plant remains, marine shell, and animal bone. This poster presents this body of evidence and considers the implications of this newly identified later occupation within the regional settlement pattern for the Peruvian South Coast.

Weinstein, Richard (Coastal Environments, Inc.), Amanda Evans (Coastal Environments, Inc.) and Jessica Kowalski (University of Alabama)**[84]** *Investigating Subsided and Drowned Shell Middens in Coastal Louisiana: Research at Sites 16SB47 and 16SB153*

Archaeologists from Coastal Environments, Inc., (CEI) reassessed the National Register eligibility of the Bayou St. Malo site (16SB47) and site 16SB153, located adjacent to one another on the southeastern shore of Lake Borgne in St. Bernard Parish, Louisiana. Previous investigations at the two sites suggested that cultural remains occurred only on the marsh surface adjacent to the lake, primarily as redeposited, wave-washed materials, and that neither site was eligible for inclusion in the National Register of Historic Places. CEI's investigations utilized terrestrial subsurface probing, hand-turned augering, and controlled testing, plus offshore vibracoring and sub-bottom profiling, to identify intact shell mounds and extensive associated areas of subsidized and drowned shell middens. It also was possible to reconstruct the occupation sequence of the two sites, identify the now-subsided and submerged landforms on which the locales initially developed, and to offer a methodology for examining similar sites in similar settings, particularly through an interpretation of the remote-sensing data within the established geologic and geomorphic contexts of the region.

[125] *Insights from Commensal Pathways into Domestication Origins*

Research on the origins of animal domestication has relied heavily on the use of morphometric characteristics of skeletal remains as diagnostic markers for important shape and size changes, which supposedly signaled the beginnings of domestication processes. However, the utility of this approach for pinpointing the timing and geographic and cultural context of initial domestication has been recently questioned. This approach has been undermined by empirical findings from geometric morphometric studies of phenotypic variation in key diagnostic traits in dogs and pigs, DNA research, and theoretical thinking from the perspective of niche construction and the extended synthesis of evolution. These developments call for rethinking of current approaches to documenting early domestication pathways, and suggest a way forward to addressing pressing issues in the how and why human societies began to domesticate animals. A step in this direction is provided by recent work on the house mouse and the context of its initial commensal bond with pre-agricultural hunter-gatherers in the southern Levant. This work offers important insights into early human-animal interactions, which did not yet involve the kind of conscious directed human intervention which was likely to have furnished the triggering mechanism for later changes in skeletal morphometry of animal domesticates.

[5] *Site Clustering Parallels Initial Domestication in Eastern North America*

Dense human settlements often emerge following a shift to agricultural economies, yet researchers still debate the underlying cause of this pattern. One driver may be what is known in ecology as an Allee effect, a positive relationship between population density and per capita utility. Allee effects may emerge with economies of scale such as those created by some forms of intensified food acquisition and production. Thus, in an Allee-like setting, individuals belonging to larger groups enjoy the benefits of greater efficiency and productivity of subsistence, as well as group defense, mating opportunities, cooperative parenting, etc. Here we evaluate this hypothesis by examining the process of initial plant domestication in Eastern North America, where we expect the process of intensification should co-occur with a shift from more dispersed to more clustered settlement patterns as individuals begin to benefit from aggregation. Application of the Clark-Evans Nearest Neighbor Index to dated site locations available from the Canadian Archaeological Radiocarbon Database support our predictions, revealing a shift from dispersed to clustered settlements that coincides with the initial domestication of plants in the region. This result supports the hypothesis that subsistence intensification in Holocene Eastern North America was associated with Allee effects and incipient territoriality.

Welch, Jacob (Yale University) and Scott Hutson (University of Kentucky)

[82] *Neighborhoods and the Constitution of Authority*

Archaeologists working on the question of integration of neighborhoods within cities or polities often begin by assuming the existence of centralized authority. Next, they move to consider the relationship between neighborhoods and such authorities. Researchers typically see this relationship as one of domination, independence, or something in between. The case of Chunchucmil, a large Maya site located in northwest Yucatan, Mexico, challenges this common approach to neighborhood integration. At Chunchucmil, neighborhoods are clearly defined but centralized authority is not. Thus, we must set aside the question of neighborhoods being weakly or strongly integrated with centralized authority and instead ask how neighborhoods constitute authority itself. In a densely populated, decentralized city, how can neighborhoods be seen as factions whose competition and cooperation produce authority? This paper explores this question while also discussing everyday processes that hold neighborhoods together, cases in which households could switch ties from one neighborhood to another, and the foundations of inequality within neighborhoods and hierarchy between them.

[167] *Environmental Variation and the Sustainability of Farms: Investigating Effects of Erosion in Northern Iceland*

The initial colonization of Iceland in the late 9th century had a profound impact on the fragile environment of the North Atlantic island. Settlement and the introduction of livestock resulted in widespread erosion and the replacement of woodlands with meadows and heaths. Changes in the environment are assumed to have played a role in determining settlement patterning and subsistence strategies. While marginal highland areas were most seriously affected, resulting in farmstead abandonment, the nature of changes in lowland areas and their impact on the productivity of individual farms is poorly understood. Local patterns of landscape change in Iceland could be highly varied as erosion in one area often resulted in soil accumulation in another. Focusing on the lowland region of Hegranes in northern Iceland, we examine the timing of erosive events in relation to fluctuations in farmstead size during three periods of occupation: pre-1104 A.D., 1104–1300 A.D., and post-1300 A.D. We consider when and where these events occurred and their implications for the viability and productivity of individual farms and households.

Wellman, Hannah (University of Oregon)

[10] *Avifaunal Remains from the Palmrose Site (35CT47): Establishing Seasonality and Investigating Endangered Species*

Avifaunal remains have great potential to improve archaeological understanding of the economy and subsistence of peoples who lived in the past, as well as to yield information about local ecology, environmental change, and past bird species distribution. The large assemblage of faunal remains from the three archaeological sites comprising the Seaside Collection from Seaside, OR, contains significant quantities of bird bone. Previous analyses of vertebrate remains (including birds) by Greenspan and Crockford (1992) and Colten (2015) suggested occupation occurred at the site year round. While these studies provide baselines for interpreting seasonality and species representation, approximately half the Palmrose faunal remains from the initial 1970s excavation are unanalyzed. Consequently, zooarchaeological analysis has been performed on a previously unanalyzed subsample (NISP=200) as part of a larger avifaunal project. This project seeks to understand not only patterns of site occupation, but to also gain greater insight on strategic hunting practices (i.e., seasonal and geographic targeting/acquisition of specific avian species). Such information is critical for

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

understanding human subsistence behavior and landscape use. This investigation also seeks to provide data on the local historical ecology of two currently endangered bird species in Oregon: the marbled murrelet (*Brachyramphus marmoratus*) and the short-tailed albatross (*Phoebastria albatrus*).

Wells, Joshua J. (Indiana University South Bend)

[231] *Principles of Open Government Archaeology: Lessons from the Digital Index of North American Archaeology (DINAA)*
American archaeology is conducted under cultural resources protection laws, but how does archaeology meet the challenge of openness? The past decade saw development of the "open government" digital information paradigm for public availability of information that underpins the functions of governance. Open government data provide a base for the interested public to offer expertise in aspects of necessary analyses, and to derive further public value from reuse of government data in novel ways. The open government concept has affected the practice and communication of scientific data in regulatory regimes as far flung as climate science, health science, and archaeology, among many others. In 2007 the "eight principles of open government" were coined by a group of public advocates, followed rapidly by a mosaic of federal, state, and local initiatives. The Digital Index of North American Archaeology (DINAA) is a completely free, big data, open government data project, centered at several public institutions; DINAA embodies open government practices to develop a novel linked-open data network of archaeological site primary data and related records across the internet. Our disciplinary capacity to engage with the principles of open government will be addressed through DINAA interoperability assessments and experiments with open government data.

[153] *Raised Field Agriculture in the Maya Lowlands: Archaeobotanical Remains from Birds of Paradise*
Up until the late 1990s, researchers believed the Maya were solely reliant on slash and burn agricultural practices. However, discoveries of rectangular canal patterns in the margins of wetlands in the Maya lowlands of Guatemala, Belize, and Mexico shined light on a new agricultural practice: raised wetland fields. One example of wetland fields is found at the site Birds of Paradise (BOP) in the Rio Bravo region of northwestern Belize. The macrobotanicals recovered from the raised fields and canals at BOP are compared to the four stages of occupation as outlined in the Birds of Paradise model on the basis of previous research. Since no previous macrobotanical analysis has been done at BOP, this research will make an important contribution to understanding what the Maya were growing in wetland canals and how the land changed over time with the implementation of agricultural practices.

[172] *At Risk Cultural Heritage and the Power of Communities*

In the years of willful destruction of cultural heritage as part of an extremist obliteration of the past, there have been several instances in the news of local populations taking stance against these destructive forces. In some cases protection of cultural heritage has become a voice against suppression and the reconstruction of destroyed monuments, e.g. through 3D printing and resurrecting lost parts, an act of defiance. Most destruction of cultural heritage, however, takes place much more quietly, through urbanization, the expansion of agriculture and modern mining. The destruction of unexcavated archaeological sites results in the complete erasure of the social history of large areas of the world. Here too, a close collaboration with communities living around and on top of the archaeology can provide access and protection of important cultural heritage, that cannot be reconstructed through 3D printing, because we simply would not know of its existence and importance.

[285] *Source Analysis of Obsidian from the Late Olmec Site of Los Soldados*

Recent compositional analyses of obsidian from Formative Period Mesoamerican sites have been used to trace obsidian to a number of Highland Mexican and Guatemalan sources, and documented shifts in sources through time. In this presentation, we report the results of a study that analyzed 401 obsidian samples excavated from the Middle/Late Formative period habitation site of Los Soldados, located 11 km from the Olmec capital of La Venta. Using three high precision techniques (LA-ICP-MS, XRF, and pXRF) we attempt a reconstruction of obsidian procurement and long-distant trade at Middle Formative/Epi-Olmec Los Soldados. Specifically, 102 small obsidian chips (ave. 1–2 sq cm) were analyzed at IIRMES using LA-ICP-MS and pXRF, and another 299 larger obsidian chips (ave. 2–5 sq cm) were analyzed at MURR using XRF. Results show that the inhabitants of Los Soldados utilized obsidian from both Highland Mexican and Highland Guatemalan outcrops. In addition, results indicate that these three techniques produce comparable results. Finally, our results demonstrate that obsidian color is not a reliable indicator of procurement source, and we argue that color should not be used to infer source.

[187] *Developing Regional Isotopic Baselines to Trace Resource Acquisition Patterns in the Mesa Verde Area of the American Southwest*

The analysis of strontium and oxygen isotopes in archaeological bone is commonly used to trace human mobility and migrations. We are using this isotopic approach to reconstruct changes in human access to large animal resources acquired through trading and hunting in the Mesa Verde area between 750–1280 AD. Current work is focused on determining the isotopic variability of the complex geology surrounding the primary study area. Isotopic analyses have been conducted on non-cultural archaeological rodent bones from surrounding regions, which, due to their limited home ranges, can be used as indicators of the bioavailable strontium isotopic signature of their local environment. Modern plant leaves have been used as a corresponding source for local isotopic signatures and in locations where rodent bones could not be acquired. While focusing on strontium analysis, we also address oxygen isotopic signatures of collected plant materials, faunal bone and local water sources providing additional complementary provenance information. The baselines determined from this work will be used to address the provenance of archaeofaunal bones in Mesa Verde assemblages, including those of rabbits, turkey, and deer.

Werness-Rude, Maline (Ventura College) and Kaylee Spencer (University of Wisconsin-River Falls)

[30] *A Good Footing: The Importance of Plaza Design in the Northern Maya Lowlands*

Ancient Maya architecture tends to follow predictable patterns. Many structures have a single, clear façade, for instance, conceptualized as a literal face. Northern sites, with their toothy-jawed monster buildings, express this idea with particular directness. Stairways and sculptural adjuncts, like altars and stelae, are integral elements that contribute to the idea of facing, both literally and metaphorically, and, as such, are critical to the visual identity of many Maya sites. With a few notable exceptions, scholarly attention often focuses on isolating and analyzing associated texts and patronage as they relate to dynastic agendas, historical chronologies, or infrastructure supporting elaborate ceremonies. The present work acknowledges the importance, and interrelated nature, of Northern Lowland plaza features like stairs, altars, and three-dimensional sculpture. In doing so, we begin to explore how discrete formatting choices, combined with object selection and placement, impact viewers' spatial experiences. Ultimately our work strongly supports the reading of Maya architecture as a performative framework. While Maya sites have long been understood as loci for ritual and other kinds of activity, the unusual aspects of specifically Northern constructs further demonstrate how such selection privileges certain behaviors in particular locations, coordinated with the functionality of those spaces.

[14] *Colonial Funerary Rituals at the Templo San Ignacio in Bogotá, Colombia*

This research analyzes the funerary customs in the sixteenth to nineteenth centuries as recovered through archaeological exploration in the Jesuit church named Templo San Ignacio in downtown Bogotá, Colombia. These skeletal remains illustrate how from the moment the church was constructed in 1610, the deposition of the deceased beneath the floor was an integral part of the occupation of this sacred space on the periphery of the Spanish colonial empire. While we recovered human remains from nearly all areas of the church, there is a meaningful difference in funerary practice, particularly between primary burials that were treated with a layer of lime and secondary burials in wooden or metal boxes of skeletonized remains. Here, we explore how age and sex correlate with differences in the organization, orientation, and method of burial, as well as the kind and amount of associated artifacts. We suggest that the variety of funerary rituals within the church reflects differences in social status or affiliation with the Jesuit order.

[216] *Chornancap: Palacio y Mausoleo de la Gobernante y de la Cultura Lambayeque, Perú*

Las investigaciones en Chotuna Chornancap—Lambayeque—Perú, pusieron a la luz el hallazgo de contextos funerarios de personajes de élite, uno de ellos correspondiente a una “Gobernante y Sacerdotisa” de la fase Tardía de la cultura Lambayeque (XII-XIII d.C.). El fardo funerario de la gobernante/sacerdotisa enterrado con ocho acompañantes, ornamentos de alto rango, poder y autoridad, han permitido documentar una de las más conspicuas autoridades políticas y religiosas de la cultura Lambayeque. La gobernante/sacerdotisa es claramente una mujer importante en Chotuna, pero también parece establecer un amplio dominio en el territorio macro regional, al comprobarse vínculos con otras sociedades complejas (Cajamarca, Chimú, Ecuador). El ajuar de la gobernante/sacerdotisa demuestra un variado, rico y complejo corpus iconográfico, que refleja su autoridad política y religiosa. Este episodio funerario permite plantear mayores argumentos para entender la dinámica del poder y religiosidad en la cultura Lambayeque, y construir un nuevo mapa sobre su territorialidad, así como reflexionar sobre la participación de mujeres en la vida política y religiosa, y reconocer un vértice importante en la organización sociopolítica que es la dualidad en el poder político y religioso así como en la ancestralidad de la sociedades andinas.

Weyrich, Laura (University of Adelaide), Alan Cooper (University of Adelaide) and Keith Dobney (University of Liverpool)

[137] *Ancient DNA Analysis of Microbes Preserved in Dental Calculus: Challenges and Opportunities*

Sequencing ancient microorganisms using next generation sequencing approaches have truly revolutionized our view of the past. While past paleomicrobiological research was largely restricted to coprolites and sediments, the recent analyses of ancient calcified dental plaque has provided novel insights into ancient human diets, disease, behaviors, and lifestyles. Despite the benefits, obtaining DNA from diverse microbial communities is difficult and is fraught with issues for first time researchers. Site, museum, and laboratory contamination can easily swamp out ancient microorganisms, even in clean facilities and in samples devoid of human DNA contamination. To circumvent future issues, the approaches recently applied to Neandertal dental calculus will be discussed in detail, including sample selection and decontamination, DNA extraction, next generation sequencing library preparation, and downstream bioinformatic analyses. As this application of these techniques is still in its infancy, both the benefits and limitations will be presented, and current problems within the field will be highlighted. Specifically, the potential downfalls of reagent background DNA and cutting-edge methodologies applied in the ancient human DNA research will be discussed in the context of ancient microbial community analysis. Through this discussion, the methodologies applied in paleomicrobiology will continue to be refined and improved for future research.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Whalen, Kathryn (University at Buffalo) and T. L. Thurston (University at Buffalo)**[144]** *"Milk sweet and sower, bread in cakes": United and Divided Foodways in Post-Medieval Northern Ireland*

Post-Medieval ethnic identities in the British Isles display similarities and differences. Across the landscape of Northern Ireland, where indigenous people were subject to English, Scottish, and Welsh colonization, a sharing of material culture is evident across all groups. For example, English fine earthenwares, locally produced coarse earthenwares and locally made tobacco pipes are equally distributed, regardless of property owners' ethnicity. This suggests that a culturally blended presentation had been adopted for the performative aspects of the foodway. However, a more varied pattern of consumption is revealed by landscape-scale geochemical survey, largely reflecting disposal of food waste: colonial and indigenous signatures differ, perhaps in line with Early Modern English textual reports on local diet. Comparing these two datasets yields a more nuanced understanding of identity: tea drinking and other English traditions were adopted throughout the Empire, while food itself continued to vary through time.

Wheeler, Kathleen (IAC, LLC)**[317]** *Discussant***Wheeler, Sandra (University of Central Florida), Lana Williams (University of Central Florida) and Tosha Dupras (University of Central Florida)****[87]** *Entering the "Valley of Death": Isotopic Evidence of Vulnerable Survivors at Roman Period Kellis, Egypt*

Breast-fed infants living in communities with adequate food access experience particularly high health risks during complementary feeding between ages 6 to 36 months. The most vulnerable of these die in this period, characterized as the "valley of death," which represents a biocultural reality. The majority of those who survive are "vulnerable survivors." The Kellis 2 cemetery sample (Dakhleh Oasis, Egypt, AD 50–450) provides a unique opportunity to analyze effects of biocultural disruptions occurring during this critical period of physiological adjustment. Maternal, fetal, and infant (N=210) 13C and 15N profiles were produced from hair, dentin collagen, and bone collagen to evaluate adverse biological factors simultaneously present during weaning and illness. Results indicate there are three situations where feeding practices and health interact: first, the mother's ability to meet nutritional demands of infants during prolonged breastfeeding; second, undernutrition due to a health insult when the child is losing passive immunity; third, children being weaned on foods lacking protein quality and content when they may already be undernourished. This strongly suggests risks of malnutrition start shortly after birth, and vulnerable survivors who escape the valley of death at this age may be even more susceptible and predisposed to environmental stressors than previously considered.

Whelan, Carly (California State University, Chico)**[38]** *Obsidian Trade vs. Direct Acquisition: A View from Central California*

Geochemical sourcing of lithic artifacts has proven to be a useful analytical tool for the studies of trade and mobility in the archaeological record. However, it is difficult to distinguish lithic material acquired through exchange from material acquired directly from the source. Economic models of lithic reduction suggest that material procured for the purpose of exchange may be treated differently than material procured for personal consumption. I compare obsidian source profiles and lithic reduction strategies from several dozen sites in central California that span the entire Holocene record of occupation. I find that residential mobility was likely high during the early Holocene, when it appears that obsidian procurement was embedded into the foraging round. Obsidian was probably procured logistically during the middle Holocene when residential mobility decreased. While opportunistic obsidian trade likely occurred throughout the sequence, it appears that regularized exchange via far-flung trade networks did not begin until after 1,100 cal B.P., when residential mobility reaches its lowest point. This contrasts with previous studies, which have concluded that obsidian trade peaked in the region prior to this period.

Whelton, Helen (University of Bristol), Lisa-Marie Shillito (Newcastle University) and Ian Bull (University of Bristol)**[126]** *Investigating the Nature and Timing of the Earliest Human Occupation of North America Using a Lipid Biomarker Approach*

Coprolites contain a suite of lipid biomolecules and are an invaluable source of palaeobiological and palaeoecological information. The identification of faecal matter through the presence of highly-specific lipid biomarkers (5 β -stanols and bile acids) has been used to identify and characterise faecal input from a range of different sources. Differentiation of these faecal markers is enabled through the diet, digestion and metabolism of the source animal. Lipid analysis of coprolites has also been used to identify dietary biomarkers, providing information regarding available plant resources. The question of how, when and why people first settled the Americas is a subject of intense debate. Evidence of human occupation in North America obtained through DNA analysis of coprolites from the Paisley Caves, south-central Oregon, has dated the earliest occupation to 14,300B.P., one thousand years earlier than previous evidence suggests. Here, a lipid biomarker approach will be applied to sediment and coprolite samples from the Paisley Caves with the aim of identifying the timing of the earliest occupation of North America by characterising the origin of coprolites found in well-stratified archaeological deposits. Biomarker analysis will also be applied to investigate diet which will enhance our understanding of the relationship between early humans and their environment.

Whisenhunt, John [91] see Whisenhunt, Mary

Whisenhunt, Mary (University of Texas at San Antonio), Kristin Corl (University of Texas at San Antonio), John Whisenhunt, Robert Hard (University of Texas at San Antonio) and John Roney (Colinas Cultural Resource Consulting)**[91]** *Archaeological Survey in Southeastern Arizona: Partnering with Landowners and Local Informants*

Southeastern Arizona's upper Gila River Valley is an understudied area once heavily occupied by prehistoric people from the Early Agriculture to Salado periods. Over time, many important archaeological sites in the Duncan-York Valley, particularly those of large, aggregated communities, were extensively looted or destroyed due to agricultural and construction leveling. To document and, ideally, preserve the remains of these vulnerable sites, we have emphasized establishing relationships of trust with valley residents. In working with valley landowners and local informants, we have identified and recorded 43 sites over the past four years. In 2017, working with a single local informant, we identified 10 previously unrecorded sites in the Duncan-Virden Valley, including two from the Mimbres Classic period, five from the Salado period, and one with both Mimbres Classic and Salado components. An additional three large sites in New Mexico were found. Most of the aggregated sites include multiple components, attesting to the attractiveness of the upper Gila River Valley locale from a resource perspective, and its long-term resilience to environmental perturbation. The valley's archaeology remains highly vulnerable to human disturbance, heightening the need for strong local partnerships to secure and preserve the sites that make up this remarkable occupational pattern.

Whitaker, Jason**[37]** *Hinterland Domestic Economies: A Summary of Recent Investigations at the San Lorenzo Settlement Cluster*

This paper summarizes recent archaeological investigations at the San Lorenzo settlement cluster in the Mopan River Valley of Western Belize. Current research at this ancient hinterland settlement is concerned with better understanding household economic organization and integration during

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

the Late and Terminal Classic (A.D. 670–890) occupations of this site.

Households are fundamental units of economic organization in both past and present societies. The examination of ancient household remains enables archaeologists to better understand micro-scale economic activities, and to situate those activities within larger societal contexts. Investigations at San Lorenzo focus on the areas associated with four structure groups. In accord with previous research at this site, analyses of collected data from these groups show similarities in terms of basic domestic activities. Ongoing analysis of lithic macroartifacts indicates differences among households in terms of reliance on local raw materials. The ancient residents of SL-21 and SL-22 produced informal tools with locally available chert. Conversely, lithic debitage collected from structure group SL-25 indicates importation of raw materials from outside the San Lorenzo settlement cluster.

White, Andrew

[127] *Patterns of Artifact Variability and Changes in the Social Networks of Paleoindian and Early Archaic Hunter-Gatherers in the Eastern Woodlands: A Critical Appraisal and Call for a Reboot*

Inferences about the social networks of Paleoindian and Early Archaic hunter-gatherer societies in the Eastern Woodlands are generally underlain by the assumption that there are simple, logical relationships between (1) patterns of social interaction within and between those societies and (2) patterns of variability in their material culture. Formalized bifacial projectile points are certainly the residues of systems of social interaction, and therefore have the potential to tell us something about social networks. The idea that relationships between artifact variability and social networks are simple, however, can be challenged on both theoretical and empirical grounds: complex systems science and ethnographic data strongly suggest that patterns of person-level interaction do not directly correspond to patterns of material culture visible at archaeological scales. A model-based approach can be used to better understand how changes in human-level behaviors “map up” to changes in both the system-level characteristics of social networks and the patterns of artifact variability that we can describe using archaeological data. Such an approach will allow us to more confidently interpret changes in patterns of artifact variability in terms of changes in the characteristics and spatial continuity/discontinuity of social networks during the Pleistocene-Holocene transition in the Eastern Woodlands.

White, Jonathan

[25] *Disability and Accommodation in the Eastern Mediterranean: Case Studies from New Kingdom Egypt and Classical Greece*

Although the archaeology of marginalized groups has been increasingly discussed in recent scholarship, people with disabilities remain largely unstudied. Recent works on this topic have paved the way for a dedicated examination of people with disabilities in the archaeological record. This paper reviews published material to critically examine physical evidence for disability and accommodation in New Kingdom Egypt and Classical Greece, both areas and periods with rich material culture, extensive architecture, a wealth of bioarchaeological samples, and comparative records. These areas are therefore a useful starting point for an in-depth cross-cultural study of people with disabilities in the ancient world. Mummies and other remains that display pathologies diagnostic of disabilities in life, artifacts and material culture made to accommodate individuals with disabilities, and even artistic depictions offer the beginnings of understanding what life was like for people with disabilities on the banks of the Nile and amongst the cities of Greece. In addition to material culture, an architectural analysis of public buildings reveals the difficulties people with mobility issues might have faced when trying to access landmarks such as the temple of Amun or the Athenian Acropolis.

[307] *Climate Change and the Middle Holocene “missing millennia” in the Southeast Asian Archaeological Record*

Archaeological research in mainland Southeast Asia is a relatively recent endeavor, but as the region’s culture history has become more fully known, a gap in evidence called the “missing millennia” has emerged. The gap falls during the middle Holocene c. 6000–4000 BP when few sites have dated deposits. Yet from evidence dating before and after those millennia, important changes must have occurred, including changes in settlement systems, lithics and ceramic technologies, the appearance of cereal agriculture, and new burial practices. Recent palaeoclimate research under the auspices of the Middle Mekong Archaeological Project in northern Laos is providing possible clues related to the gap in archaeological evidence. Four new speleothem records document an abrupt trend of weakened monsoons beginning at approximately 5–4.5- ka initiating the onset of a mega-drought that peaked at approximately 4.0 ka. The drought climax near the “4.2 ka event” is when other parts of Eurasia and Africa experienced sharp climate shifts and associated human dislocations and societal adjustments. This paper reviews the emerging evidence and proposes an initial interpretation of societal responses to this significant period of climate change

Whitehead, Mike, Matt Bjorkman (Indiana University of Pennsylvania) and Ben Ford (Indiana University of Pennsylvania)

[334] *Recent Archaeology at Fort Necessity National Battlefield: A Cooperative Approach to Cultural Resource Management*

A series of archaeological projects have recently been conducted at Fort Necessity National Battlefield through a Cooperative Agreement between the National Park Service and Indiana University of Pennsylvania. These projects have incorporated geophysical survey, metal detection, systematic shovel testing, and test unit excavation, as well as artifact curation and reporting. Through this partnership, the National Park Service has received an avenue for cost-effective cultural resource management, and has gained new data and new insights for managing and interpreting Fort Necessity and other historic sites located at the park. In return, Indiana University of Pennsylvania has been able to provide new opportunities for its undergraduate and graduate archaeology students to acquire practical field and lab experience beyond the standard field school setting. Indiana University of Pennsylvania has also benefitted by increasing the visibility of its archaeology programs through conference presentations, report publications, and public outreach, and has fostered a relationship with the National Park Service that is conducive for future student research projects at Fort Necessity National Battlefield. This paper summarizes the archaeology projects performed through this Cooperative Agreement, and describes the benefits, opportunities, and challenges presented by this partnership between a Federal agency and State University.

Whitehead, William (SWCA Environmental Consultants)

[68] *Using Drones for Exploring the Links between Vegetation and Traditional Archaeological Survey: An Example from Arizona*

The use of drone based photogrammetry is now well established in archaeology for surface modeling and mapping of archaeological sites. The Arizona Department of Emergency and Military Affairs (AZDEMA) is sponsoring a number of long-term projects on their properties. One project will be using traditional drone photogrammetry to create high resolution maps to assess plant communities, plant health, and canopy structure as a way of exploring links between vegetation and other survey methods. A pedestrian survey, geophysical survey, and biological survey will be combined to show the interconnections between these frequently used techniques and the newer techniques of drone photography for surface modeling and vegetation modeling. With sub-centimeter accuracy, surface modeling along with canopy modeling is able to find subtle features on the landscape that are normally missed during pedestrian survey. Emergent photosynthetic populations, canopy variation, and biological dead zones can also be used to establish high probability anomaly areas that can be further investigated with traditional testing techniques. The results of the 2017–2018 field seasons will be summarized and the best practices for using these techniques will be presented. In areas with deeply buried features or in areas with few artifacts these techniques seem to be the most promising.

Whiteman, Erik (USFS—Payette National Forest) and Morgan Zedalis (USFS—Payette National Forest)**[106]** *Can You Hear Me Now?—The History of a Telephone Booth in the Frank Church-River of No Return Wilderness*

The Frank Church—River of No Return Wilderness is an area that allows its visitors to experience solitude in the nation's largest wilderness in the lower 48. Often unrealized, is that historically, this rugged landscape had quite an extensive communication network while it was managed as the Idaho Primitive Area. One related historic feature managed by the Payette National Forest is the Coyote Springs Telephone Booth. Telephone communications were developed in the area from the late 1920's through to the 1930's. During this time, telephones were installed, often at major trail junctions, on a tree. However, at this location the smoke chasers built a booth. The telephones were used by rangers, fire fighters, and others to contact dispatch on matters regarding daily administrative operations, fire activity, and emergencies. Such a system facilitated the development and management of the Idaho Primitive Area and the Wilderness on the Payette National Forest. Without the phone systems, managing the area would have been a different experience altogether, with firefighting operations being greatly impacted. This poster will present the results of field monitoring and archival research concerning the telephone booth.

Whitley, David (ASM Affiliates, Inc.) and Tony Quach (ASM Affiliates, Inc.)**[180]** *In-Situ pXRF Analysis of Episodic Pictograph Production*

Yokuts ethnography indicates that pictograph sites passed from father to son to grandson within shamanic lineages, suggesting episodic painting at these locations. This practice is archaeologically supported by motif superimpositions and minor stylistic differences at sites. An in-situ pXRF study of red motifs was conducted at site CA-TUL-2871, Springville, CA, in the hopes of analytically distinguishing painting episodes, based on the assumption that chemically dissimilar pigments may have been used that are otherwise visually indistinguishable. Six hypothesized painting episodes were identified based on motif type and panel position. pXRF measurements were taken on 8 motifs and 3 rock surfaces. Multivariate statistical analyses showed no significant differences in the hypothesized groupings and, in 2 cases, between motifs and unpainted rock, suggesting that variations in paint thickness, weathering and rock coatings affected the elemental measurements. An experimental study was then conducted to evaluate the effect of paint thickness, confirming its significance in measured results. Though pXRF remains a useful tool for examining in-situ geochemical variability, numerous variables must be controlled if it is to be applied to distinguish pictograph painting episodes or determining elemental composition.

Whitley, Thomas (Sonoma State University), Michael Konzak (Anthropological Studies Center, Sonoma State Univ), Bryan Mischke (Anthropological Studies Center, Sonoma State Univ), Robert Watson (Anthropological Studies Center, Sonoma State Univ) and Paul Engel (National Park Service)**[221]** *20,000 Years under the Sea: Dynamically Visualizing the Past and Future of Shorelines, Ecosystems, and Climate Change at Point Reyes, California*

Geospatial analysts are now capable of developing increasingly accurate models of past and future 'shorelines' and the predicted impacts they might have on archaeological sites or cultural landscapes. But GIS alone cannot realistically simulate hydrodynamic effects, terrain displacements, or changes in vegetation communities, water bodies, and atmospheres. Funded by the NCPTT, this study combines GIS analysis of LiDAR terrain and bathymetric models with the photorealistic 3D modeling capabilities of Terragen 4.1 (a scenery generator used in the film industry) to produce visualizations and animations of the past 18,000 years, and future 2000 years, of landscape evolution at Point Reyes, California. The objective is to not just measure the potential impacts of climate change on known cultural resources, but to develop a simulation of how geomorphological effects have changed the terrain itself, while climatic variables have dramatically altered ecosystems. These visuals and animations are situated at low earth orbit, oblique aerial, and ground level perspectives. The results are presented in digital immersive environments as well as analogue 3D printed models for visitors to experience at the Point Reyes National Seashore. The ultimate objective is to expand these techniques to the rest of the California, and potentially other parts of the world.

[320] *Discussant***Whitlock, Allison (New York University)****[144]** *Medieval Agricultural Practices in the "Champion" Region*

During the early medieval state formation process, England's political organization transformed from localized tribal groups to large and consolidated kingdoms. Farmers at early medieval settlements experienced a related increase in agricultural production demands, and they introduced improved agricultural technology such as replacing the light ard with the heavier moldboard plow. The midlands counties (commonly referred to as the core of the "Central Province" or "Champion" region) are often credited as the source of early medieval agricultural innovation.

Macrobotanical indicators of crop production practices are underutilized in medieval rural settlement studies. Archaeobotanists working in the British Iron Age have developed directly relevant models of identifying the crop processing phase, the lighter ard plow from the heavier moldboard plow, and environmental stress indicators due to intensification. I will present the preliminary analysis of macrobotanical samples from the medieval manor site at Harpswell, Lincolnshire. I will apply the archaeobotanical models to these samples and additional samples reported in other Lincolnshire "Central Province" settlements to identify agricultural changes and question the applicability of "Champion" to this region.

Whitlock, Bethany (Brown University), Kevin Lane, Charles French, David Beresford-Jones and Oliver Huaman Oros**[224]** *Identifying Strategies of Integration and Cooperation during the Late Intermediate Period (AD 1000–1480) at Sangayaico, South-Central Andes, Peru*

The Late Intermediate Period (LIP) in the highlands of the Central Peruvian Andes was characterized by a marked intensification in economic specialization. In contrast to the preceding periods, in which mixed agro-pastoral groups appear to have dominated highland Peru, many LIP populations seem to have adopted increasingly specialized pastoral or agricultural strategies. This increased economic specialization would likely have fostered inter-group cooperation, as subsistence generally required the products of both herding and agriculture. In tandem with this, the LIP also saw the development of new forms and scales of ritual, as groups sought to extend their geographic reach and influence.

Drawing on excavation data and analysis of micromorphological samples from Sangayaico, in the Upper Ica drainage of the south-central Peruvian Andes, we examine how one LIP community established and maintained bonds of cooperation in a time of major political and economic transitions. Initial excavation data—such as the plaza dated to the LIP—suggests that ritual activity at Sangayaico increased in scale and intensity during this period. Micromorphological analysis of these ritual contexts has helped to illuminate how these features were constructed and used, thus furthering our understanding of how communities used ritual to mediate community relations.

Whitmore, Deidre and Willeke Wendrich (Cotsen Institute of Archaeology at UCLA)**[172]** *DIG: Digital Information Gateway to Sustainable Reuse*

Archaeological data are a form of at-risk cultural heritage, because they are the only record of an excavation. As a research community that deals with often irreplaceable datasets and continuing threats to records and sources, archaeologists regularly reuse data, despite these datasets frequently being locked in printed tables and appendices. DIG, the Digital Information Gateway from the Cotsen Institute of Archaeology Press, aims to facilitate

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

reuse by publishing research data within the context of monographs and in sharable formats with the information needed to understand and reuse these data. Creating a sustainable workflow is imperative to DIG. The team has developed a handful of tools to assist with the collection and review of metadata and documentation while authors are engaged with the Press in preparing their manuscript. Additionally, this project builds on the community's increasing interest to preserve datasets (i.e. tDAR, ADS) in an effort to incorporate emerging preservation practices into the evolving scholarly publication framework. All data published on DIG are deposited in repositories. The platform's architecture is designed to support interoperability with existing repositories while modular metadata schemata and Linked Open Data standards provide the flexibility to adapt to new technologies and changes in the research community.

Whitridge, Peter (Memorial University of Newfoundland)

[220] *Arctic Heterotopias: Qariyit as Queer Spaces in Precontact Inuit Communities*

Gender and landscape have each proved to be such powerful archaeological tropes that thinking them together seems sure to yield interesting results. In the precontact Inuit world, gender and related dimensions of embodiment were key axes of spatial practice and place-based identification. Women's and men's activities were differently distributed across the landscape—in general, women occupying and managing domestic and near-community spaces, and men employing watercraft and dogs to operate within a wider landscape—but these varied and evolved over the lifecourse along with gendered identities themselves. Angakkuit (shamans) extended this range in every direction, to encompass ethereal and submarine realms and ambiguously queer human and nonhuman identities. The qariyit (ceremonial structures) that were the principal sites of their community performances and the points of departure for otherworldly travels constituted the heterotopic non-centers of large winter villages.

Whittington, Stephen (National Mining Hall of Fame & Museum)

[11] *Mapping and Spatial Analysis of an Ancient Mixtec Capital in Oaxaca*

Chiyo Cahnu, a Mixtec mountaintop capital, is unusual in relation to the archaeology of Oaxaca. Mapping one square kilometer of the capital using powerful GPS devices between 2013 and 2017 revealed about 370 building sites, almost 2,400 agricultural and residential terraces, and ancient roads constructed on the steep slopes of Cerro Amole. The building sites range in complexity from single rooms to compounds with temples and dozens of rooms surrounding patios. The ball court is 45 meters long, making it one of the largest structures of its kind in Oaxaca. The capital is depicted on the famous Mapa de Teozacoalco, a document painted by a Mixtec artist and explained by a Spanish colonial administrator around 1580. Interpretation of images on the Mapa and in related pre-Hispanic and early colonial codices suggests that the principal occupation of the capital occurred over a period of only 236 years (AD 1085–1321) during the Postclassic period. Chiyo Cahnu is remarkable in the Mixtec area because it is larger than normal for Postclassic settlements and because it was inhabited for such a short length of time. The capital has implications for understanding the amount of construction a population can accomplish rapidly and its possible impetus.

Wholey, Heather (West Chester University)

[328] *Population in the Middle Atlantic Archaic: The Middle Atlantic Transect Approach*

Middle Atlantic archaeology is unique due the tremendous ecological and cultural diversity present within a relatively small, compressed region. The ecological transect model has been widely applied in regional archaeological research for the past thirty years. It is essentially a landscape approach that traverses several major physiographic provinces to encompass the range a discrete and interconnected cultural activities across a broad region. This work employs the transect model to explore how factors such as settlement preference, mobility, social organization, resources, and subsistence practices influence group size and population throughout the Archaic period. This appears to be a tale of population resilience through responsiveness to changing external and internal circumstances that has fostered the growth of cultural diversity across the region.

Wichlacz, Caitlin (Arizona State University)

[287] *An Efficient and Reliable Mechanism: The Human Experience of Hohokam Ceramic Exchange during the Middle Sacaton Period (A.D. 1000–1070)*

The human labor involved in physically carrying goods across the landscape underpins all artifact provenance studies in the prehispanic American Southwest, yet this labor is all too often left unacknowledged and unconsidered, even as detailed and sometimes remarkable patterns of artifact production and distribution are brought to light. This is especially true for the Phoenix Basin Hohokam, where ceramic provenance studies have revolutionized archaeologists' abilities to understand the organization of pottery production and distribution, but the human labor involved in ceramic transport has been mostly only implied or obliquely referenced.

In this paper, I employ an Archaeology of the Human Experience (AHE) framework to explore the labor involved in ceramic exchange among the Phoenix Basin Hohokam during the middle Sacaton period (ca. A.D. 1000–1070), when the volume and extent of this exchange were at their peak. Through a case study from the site of Las Colinas, I focus on situating and investigating the labor of ceramic exchange as a condition of life for the middle Sacaton period Hohokam, considering how this labor was part of and affected broader social contexts, and exploring bodily, social, and temporal aspects of the experience of ceramic transport, drawing upon archaeological and ethnographic examples.

[223] *An Experimental Approach to Understanding Paleoindian Bipolar Lithic Artifacts*

Bipolar lithic artifacts can be challenging for researchers to understand in the archaeological record. Although these artifacts were first noted in North American literature half a century ago, archaeologists continue to debate over terminology and considerations of morphological and functional distinctions of bipolar objects. This experimental approach aims to shed light on these disparities whilst re-examining morphological and functional characteristics attributed to manufacture and use-wear. Recent experimental work with the Mockhorn Island Clovis assemblage, by the Smithsonian Institution Paleoindian/Paleoecology Program, served as a model for this study. This poster presents the results of manufacturing, feasibility, and use-wear experiments on quartzite beach pebbles split through bipolar reduction.

Wieckowski, Wieslaw (University of Warsaw)

[211] *Embodied Empire: Life and Death of Wari Elites from Castillo de Huarmey*

The discovery of an undisturbed burial context at Castillo de Huarmey, bringing to light remains of Wari immediate elite members, finally embodied long discussed highest social levels of Wari Imperial elites. Until that time they characteristic was derived almost exclusively from indirect sources, mainly material remains of high quality material culture and architecture. Now, there is a chance to get a glimpse on their actual life stories, occupation, and to see their faces. Analysis of the burial context proves also there was an important change in the perception of female role in the society that occurred sometime during the Middle Horizon. Reconstructing lives and mortuary rites on basis of Castillo de Huarmey is also an important addition to the

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

discussion about the Wari presence not only on the North Coast of Peru, but also to the interpretation of Wari expansion, and forming of the Empire. To see its multidimensional aspect, a comparison with other Wari provinces is necessary.

Wiersema, Juliet (University of Texas, San Antonio)

[275] *Far from the Crown: Currents of Opportunism along the Dagua River during the Late Spanish Colonial Period (Nueva Granada)*

Throughout the late Spanish colonial period, the Dagua River in Colombia's Cauca Valley was a multi-cultural backwater. Its shores were inhabited by mestizos, mulattos, slaves, and free slaves, with a minority of Indians and Spaniards. While this area was mined for gold and offered one of few routes to the Pacific from Colombia's interior, the Dagua River region was largely cut off from global trade and colonial currents due to its geographical remoteness. 50 days distant from Cartagena and 14 from the nearest town, Cali, it was just beyond the reach of Spanish colonial authorities. For the Dagua's largely self-governing and self-sustaining inhabitants, including African slaves, topographical challenges such as steep cordilleras, dense tropical jungles, and torrential rivers gave rise to social, cultural, and economic opportunities. Spaniards, who theoretically were in control as hacendados, merchants, and miners, depended on forasteros—French doctors, Italian notaries, and African slaves. African slaves in the Dagua region came to wield great power and autonomy, controlling terrestrial and river commerce, effectively fighting royal aguardiente and tobacco monopolies, buying their freedom, and building free slave communities. Their descendants would inhabit this area into the early twentieth century. Methods are art historical, historical, cartographic, and ethnographic.

Wiewel, Adam and Rebecca Wiewel (Arkansas Tech University)

[5] *Remote Sensing Investigations of the Arzberger Site (39HU6)*

Arzberger is a fifteenth- or sixteenth-century fortified Plains Village site located near present-day Pierre, South Dakota. Although it is an important example of an Initial Coalescent settlement in the Middle Missouri subarea of the Plains, its most intensive study occurred in 1939 when the village was accurately mapped and test excavations were made of four lodges and the fortification. This early work identified a surprisingly low number of houses for such a large settlement. In recent decades, quarrying activities have destroyed substantial portions of the settlement, despite its 1964 designation as a National Historic Landmark. To better understand the site's content and assess its current condition, archeologists from the Midwest Archeological Center (National Park Service) recently deployed a six channel SENSYS MAGNETO MX V3 gradiometer system. Besides the magnetic data, the unit's integrated GPS yields accurate topographic information. When combined with historical aerial photographs, these datasets provide a clear view of the remaining portion of the village's fortification, its many lodges, and probable storage pits. We will discuss these significant findings as well as review several benefits and difficulties of surveying with the SENSYS gradiometer system.

Wiewel, Rebecca (Arkansas Tech University)

[94] *Making Active Learning Practical*

This poster presents the outcomes of my efforts to make active learning activities an integral component of undergraduate courses in archaeology. For the past three years I have taken my Southeastern Archaeology course from a typical lecture-based class to a more active learning environment that includes hands-on lab activities, participation in fieldwork, field trips to archaeological sites, and service learning opportunities at our campus museum and local research station of the Arkansas Archeological Survey. Beyond assessing learning outcomes, I discuss practical challenges and lessons learned from implementing these measures with limited resources at a mid-sized teaching institution in which I am the sole archaeologist.

Wilcox, Daniel (The College of Wooster) and Paul Nick Kardulias (The College of Wooster)

[225] *Trade and Production of Steatite Vessels in New England*

This research examines the trade and production of steatite vessels during the Archaic Period in New England. The study focuses specifically on a quarry Located in Barkhamsted, Connecticut where recent excavation has supplemented prior investigations from 1949 to 1951. The material from this site is located at Yale's Peabody Museum and the archaeology lab at Central Connecticut State University. We also examine the artifact assemblages from other sites in Connecticut and Massachusetts. Along with the archaeological assemblages, this work looks at the geology and geography of Connecticut, to obtain a better understanding of how the environment provided the key resources that inhabitants exploited. Finally in order to examine the trade of vessels and utensils this research examines the geochemistry of steatite through XRF analysis to determine the sources of artifacts within New England. Using models proposed by Renfrew and Binford we propose an exchange system between areas in New England with and without a local source of steatite. The Study provides an examination of Archaic lifestyle along the Atlantic seaboard, with elements of both local and interregional interaction.

Wilcox, Timothy (Stanford University)

[272] *Gobernador Polychrome as a Material Expression of Survivance*

The production of Gobernador Polychrome Pottery by the Navajo people, is entangled in many social and material negotiations of survivance. Its production in the Dinétah Region of New Mexico, during the late Seventeenth and early Eighteenth century place it in a time of Native resistance to Spanish colonization in Northern New Mexico. This resistance, in the form of a pan-Indian uprising, the Pueblo Revolt of 1680, sets the stage in which the production of Gobernador Polychrome emerged and ceased. This event, along with other contexts of colonization, influenced the practices of the Navajo people in this period. While western science has painted the Navajo as recent immigrants to the SW, indigenous understandings of place and identity contradict this view. For instance, an Indigenous braided model of interrelatedness does not fit with the theoretical bases of genetic and linguistic evidence, which favor dendritic models. Contemporary Indigenous communities have been forced to internalize concepts such as blood quantum and accept western style governments that promote difference and competition for resources. This case study highlights the emergence and rejection of practices that define contemporary Navajo culture and remind us of a time when cooperation accomplished common goals.

[189] *Utilization of Fish Resources at the Hupoate Site on Tongatapu, Kingdom of Tonga*

Analysis of archaeological fish remains from the Hupoate site, on Tongatapu in the Pacific Island Kingdom of Tonga, identified 18 different families. Significant change in relative abundance was evident in Lethrinidae (emperors) and Acanthuridae (surgeonfish, unicornfish), two families common as food fish in Tonga. Frequencies of the families were compared between the early settlement period (~2850–2900 cal BP) and the subsequent Plainware/Aceramic period. Larger-bodied Lethrinidae, which are common in both periods, show a decline in relative abundance, while smaller-bodied Acanthuridae show a corresponding increase in abundance. Although this pattern might be viewed as evidence for resource depression, potentially linked to intensive fishing of Lethrinidae, bone measurements show no decrease in the size of Lethrinidae over time. A number of factors can account for the change in taxonomic abundance. While the relative abundance patterns may be a result of change in reef productivity caused by increased pressure on Lethrinidae, they could also indicate a shift in fishing techniques, or intensification of fishing involving the addition of a wider range of species to the food inventory.

Wiley, Kevin (New York University) and Joseph Schuldenrein (Geoarcheology Research Associates)**[39]** *Riverside 2: Urban Archaeology, Landscape Reconstruction, and Public Engagement*

The Riverside 2 site, situated along the original shoreline of the island of Manhattan, presents a unique opportunity for landscape reconstruction within an urban archaeological context. Drawing upon geoarchaeological borings, excavation units, and historical sources, we created a 3D GIS model of the site highlighting its role in the development and transformation of the emerging neighborhood of the Upper West Side in the 19th century. The results of these research efforts have recently been put on view in a permanent gallery housed within the development project whose construction precipitated the archaeological excavation.

Wilkie, Laurie (University of California Berkeley)**[278]** *Discussant***Wilkinson, Darryl (University of Cambridge)****[181]** *Not Becoming Inka: Anarchism as a Set of Human-Thing Relationships*

Power depends on certain modes of relation between people and things; a fact archaeologists have recognized for some time. Thus there can be no states or rulers without monuments, elite regalia, official iconographies and the like—although traditionally it is only the human component that has been seen as the active element in this equation. More recently, archaeologists have sought to reconsider humans not as the users of things, but as their partners and co-participants in the social. In this paper I draw on such approaches to rethink anarchism as a particular mode of human-thing relations, rather than as an ideological stance or political philosophy. As a case study, I will examine a set of village communities of the Andean Late Intermediate Period (c.1000–1450) who resided on the heavily forested eastern piedmont to the northwest of Cuzco. Drawing on two seasons of excavation data, I will show how these settlements were founded by people who were attempting to flee the Inka Empire and all it represented. The rise of the Inka Empire entailed complex new forms of human-thing relations, and for the ancient anarchists presented in this paper, not becoming Inka was a process of actively rejecting those relationships.

Will, Manuel [124] see Conard, Nicholas

Willey, P. (Chico State)**[179]** *Stature of Adult Human Remains from Point San Jose*

Stature provides insights into the lives and wellbeing of individuals and populations. In living groups, stature is employed to evaluate differences associated with time (secular trend), geographic distribution, sexual dimorphism, socioeconomic differences, and from other living conditions. Poor living situations hinder growth and yield shortened statures; advantageous conditions enhance growth and result in greater heights. Similar influences are inferred for past populations and the skeletal samples that represent them, including human remains from a pit at Point San Jose (PSJ), San Francisco. Employing all possible PSJ adult stature estimations in this analysis, they average 64.3 inches. The PSJ statures display a bimodal distribution, with peaks at 62 inches and 66 inches. That bimodality may result from a number of causes: small sample size, over-representation of a few individuals, ancestral differences, or sexual dimorphism. When compared with worldwide adult statures, the PSJ material display average stature. On the other hand, compared to a 19th century U.S. military sample, most members from PSJ stand shorter than that group by an average of 3.5 inches. This result suggests that the PSJ individuals faced impoverishment, deprivations and other challenges during their growth period.

Willhite, Brenton (University of Missouri)**[267]** *Understanding the Emergence and Spread of Chupadero Black-on-white Ceramics through Network Analysis*

It has been hypothesized that social ties between the Salinas Pueblo Province and the Jornada Mogollon sparked cultural change in both regions. In this study, I use Social Network Analysis to characterize these interactions from A.D. 900 to 1450 via the spread of Chupadero Black-on-white pottery. Integral to the study of social interaction and the emergence of Chupadero Black-on-white ceramics is the nature of the pithouse-to-pueblo transition in each region. Prior to the emergence of pueblo architecture, populations in Salinas lived in pithouses and used predominantly brownware ceramics. The gradual shift to above-ground architecture in the area coincided with a marked increase in the abundances of Chupadero Black-on-white. Similarly, while the shift out of pithouses occurred sporadically in the Jornada Mogollon world, those sites that eventually shifted to above-ground architecture frequently display higher quantities of Chupadero Black-on-white. By creating ties between archaeological sites based on ceramics and architecture, Social Network Analysis produces networks of hypothesized interaction between sites in a large portion of the Mogollon culture area.

Williams, James (Renmin University of China)**[75]** *Communities, Violence and Fortification: A Study of Longshan Landscapes*

The Late Neolithic period in Central China, known as the Longshan period, has long been associated with violence and warfare. There have been several theories as to what are the catalysts for this period of increased violence. This paper will review the evidence of warfare and violence during this period. Using disparate spatial data this paper will investigate the implications of warfare and violence on the settlement patterning of the Central Plains of China. Through this investigation we can directly test several of the theories which have been proposed for the region. It has been long understood that warfare and violence can shape a regional landscape this paper offers methods into investigating specific motivations and catalysts for warfare. In doing so it also provides new insights into how warfare may have affected changes in the settlement patterning during the Late Neolithic in Central China.

Williams, Justin (Wheelock College) and Richard M. Niquette (University of Kansas)**[186]** *From Clovis to Dalton: Key Differences in Hafted Biface Resharpener*

In order to further understand Paleoindian lithic technological organization, we examined blade and haft elements of Clovis, Gainey, and Dalton hafted bifaces. Samples inspected were from across the Midwest, the Southeast, and the Northeast. Due to the rarity of these hafted bifaces, images of individual bifaces were used to take traditional linear measurements on the hafted bifaces in this study. Results indicate key differences in retouch and resharpener patterns throughout the Paleoindian period, likely due to factors such as variability in raw material resources, prey choice, and technological requirements. The findings of this study have large-scale implications for pan-regional studies of Paleoindian hafted bifaces.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Williams, Patrick Ryan (Chicago Field Museum) and John Janusek (Vanderbilt University)**[181]** *Wari Huamani, Tiwanaku Apu, and the Political Work of Things*

In this paper, we focus on the relationships between landscape places viewed as ancestors to Andean communities and things that further political agendas in imperial contexts. We explore how objects and people work together to create or deconstruct political power in Wari and Tiwanaku societies. In particular, we focus on objects, including ceremonial ceramics and lithic monuments, as examples of things that participate in building power relationships with local communities. We argue that distinctive agencies exist within objects in Wari and Tiwanaku contexts, despite the contemporaneity and shared iconography of the Middle Horizon states. Part of this distinction lies in the way in which Wari political power emanates from relationships between sacred places, objects, and humans in divergent ways from the ways Tiwanaku relationships between these entities are constituted. Our work draws on examples of archaeological data from Wari and Tiwanaku provincial centers like Cerro Baul and Khonko Wankane, as well as investigations in the monumental core of Tiwanaku to assess the political work of things in the highland Andes' first imperial formations between 600 and 1000 CE.

[211] *Chair***Williams, Veronica (CONICET- UBA)****[207]** *Farmers and Herders in the High Quebradas of the Valle Calchaquí Medio (Salta, Argentine) between the 11th and Early 17th Century*

For Northwestern Argentina (NWA) the period between AD 1000 and 1400 represented a state of political fragmentation, conflict situations, and the emergence of hierarchies materialized in the presence of defensive settlements, iconography, war paraphernalia, and evidence of trauma on human remains. Climatic change that occurred in the Andes starting in the 13th century is one of the main causes of this regional disruption. The archaeological data from the high quebradas (ravines) of the Valle Calchaquí Medio, in the present-day Province of Salta, NWA between the 11th and 17th century, allows us to hypothesize about a continuity in the occupation of this area. This occupation, presented a continuum of social logic and practices from earlier Prehispanic periods linked to subsistence strategies and social reproduction, such as seasonal and altitudinal management by farmers and herders.

Williams Sr., Paul [250] see Skinner, Dougless

Williams-Beck, Lorraine (Universidad Autonoma de Campeche)**[28]** *Ballcourts, Towers, and Urbanism in the Chenes Region, Campeche*

In the geographic heartlands of the Yucatan Peninsula, academic literature describes the Chenes region as an "archaeological province" with a particular regional cultural character, in which sculpted monuments with glyphs or ballcourts are scarce components in urban systems, and even less frequent in most monumental cores. To date only three ballcourts had been recorded. After field seasons in 2016 and 2017 I confirm another example in Tabasqueño, the only site also to exhibit a free-standing tower adjacent to the ballcourt. This paper discusses ballcourt position and orientation within the four monumental core layouts, and how all four peers share urban design schemes that include structures, sculptures, mural painting, and other elements. I also will discuss what ballcourt presence means within this regional context. Two working hypotheses are proposed: a) one of a functional nature that deals with isolated tower structures found in three additional sites, and b) a combined structural symbolic premise guiding geographic location: ballcourts and the ballcourt—tower complex play significant roles in ancient urbanism that create foundations for an emic perception of culture area.

Willis, Kelsey, Destiny Crider (Anthropology Department, Luther College) and Clifford Brown (Anthropology Department, Florida Atlantic University)**[263]** *Ceramic Evidence of Normal and Anomalous Diffusion from Mesoamerica into Northwest Nicaragua*

The ceramic record of Pacific Nicaragua can be interpreted as showing evidence of migration in the form of both normal and anomalous diffusion. Normal diffusion is seen in the Department of Chinandega through the ceramics of the early facet of the Late Preclassic Cosigüina complex, which derive from the Providencia Sphere. This ceramic sphere originates from the southern highlands of Guatemala and western El Salvador and now extends at least to northwest Nicaragua. The evidence of superdiffusion lies with a type known as Delirio Red-on-white, which is found at scattered sites in Mexico, Guatemala, El Salvador, Honduras, and Nicaragua. We argue that its patchy and discontinuous distribution is evidence for superdiffusion because, as we show through design analysis and comparison of forms and pastes, Delirio is related to Coyotlatelctlo types from Late Classic Central Mexico. We suggest that Delirio and associated types may serve as a marker for the historically attested Chorotega migrations to Nicaragua, Chiapas, and nearby areas.

Willis, Staci**[290]** *Pollen in Nautical Archaeology*

The inclusion of pollen analysis into the excavations of shipwreck sites has improved our understanding of the cargoes these vessels carried, the timing of the wrecking event, and, in some cases, the processes of ship construction. Vaughn Bryant spearheaded many of these advances in the palynology of nautical archaeology through his mentorship of nautical archaeologists at Texas A&M, of which, the author here is one. This paper will highlight the important steps Bryant and his students have taken to promote the use of pollen analysis in nautical archaeology, including a case study of the author's research on Roman-era sewn boats of the upper Adriatic Sea.

Willis, William (University of Nevada Las Vegas)**[164]** *Reexamining Environmental Stress in Settlement Transitions: Implications for Understanding Settlement Patterns and Socio-environmental Response on the Shivwits Plateau*

Where people choose to settle can be thought of in part as a behavioral response to the ecological constraints placed on a society's ability to meet its needs through interacting with its environment. While humans are indeed not always completely rational actors, their endeavors require either basic raw materials or environmental conditions that, when absent, either force them to seek out other regions for exploitation or adapt to new conditions. Because of this, archaeologists have long been interested in the human response to the environment, particularly in areas of elevated risk. This research seeks to address the variability in Virgin Branch Puebloan settlement patterns on the Shivwits Plateau though time as a response to socio-environmental stress. Environmental data, ceramic seriation, habitation site variation and locations, and paleo-climatic reconstruction are used to spatially examine land use patterns over time. Additionally, this paper reports on assemblage patterns that are suggestive of identifying a core production area for Shivwits Ware ceramics, and discusses the future of current research undertakings on the southern portion of the Shivwits Plateau.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

Wills, Chip (University of New Mexico)**[283]** *Settlement Re-occupation at Chaco Canyon: Evidence for Migration and Serial Plurality*

Places where people invest significant human capital and resources in architecture and landscape engineering may nevertheless be abandoned in response to environmental or social factors. Those places might eventually be re-occupied by the original builders, or in some cases, appropriated by others. During migrations, abandoned or largely abandoned places may become destinations for people on the move. Chaco Canyon, New Mexico, has archaeological evidence for episodes of abandonment or termination, followed by re-occupation, linked to migration processes. It is possible that there was greater cultural diversity during periods of re-occupation, suggesting mixing of populations from different sources.

Wilson, Nathan (Universidad Nacional Autónoma de México (UNAM))**[285]** *Obsidian Importation and Use at Teotepec, Veracruz, Mexico: Situating Site-Level Lithic Activities within a Regional Context*

In this paper, I present new data on lithic production, consumption, and importation from the site of Teotepec, a large pre-Hispanic settlement located in the Sierra de los Tuxtlas region of Veracruz, Mexico. Like much of the Mexican Gulf Coast, the Prehispanic inhabitants of the Sierra de los Tuxtlas relied on non-local obsidian for most of their lithic needs. Using the results of recently completed technological and visual source analyses, I identify differences in production and consumption behavior across the site and over time to situate these behaviors within regional and interregional contexts. The combination of regional-scale data from previous projects and site-level data (both from surface collection and excavated contexts) derived from the Proyecto Arqueológico Teotepec (PAT) allow for the assessment of importation and use of obsidian at the site and to gauge Teotepec's participation in larger regional processes.

Winemiller, Terance (Auburn University at Montgomery) and Virginia Ochoa-Winemiller (New Jersey City University)**[40]** *The Imitation Game: Hybridization of Styles and Trade Goods in Ancient Eastern Honduras*

This paper discusses the spatial, typological, and stylistic analyses of obsidian and ceramic artifacts recovered from El Chichicaste and Dos Quebradas, two prehistoric sites in the department of Olancho, Eastern Honduras. Using geographic information systems and 3D laser scanning technology, analyses revealed the extent of trade relationships that these two ancient communities maintained with sites in Mesoamerica and their southern neighbors in Central America. We argue that integration of foreign trade goods and ceramic stylistic decoration into local lifeways at these two eastern Honduran sites shaped subsequent hybrid cultures that included ideologically perceived status symbols from nearby communities and at the same time infused them with local interpretation and uniqueness.

Wingfield, Laura (Contract Curator, Art of the Americas, Nasher Museum of Art at Duke University)**[263]** *A Tale of Two Cities: Quelepa, El Salvador and Guayabo de Turrialba, Costa Rica*

The art and structures of the ancient Central American sites of Quelepa in El Salvador and Guayabo de Turrialba in Costa Rica both suggest influence from afar by the late first millennium CE. Quelepa was restructured from what was likely a Lenca foundation to reflect possibly invasive Veracruz tastes, yet some Lenca elements were retained. Did both Lenca and Veracruz immigrants live together peacefully? What can art and architecture tell us of this possible merger, an instance of multiculturalism? Farther south in the highlands of Caribbean Costa Rica, the site of Guayabo de Turrialba was sculpted in the image of Colombian cities farther to the south or possibly vice versa. Yet Guayabo art retains traits of what is likely deep-seated ancient Huetar culture in this region, newly blended with Tairona styles. What can a comparison of these two sites reveal of mobility and multiculturalism in pre-Hispanic Central America?

Winter, Marcus (Centro INAH Oaxaca) and Teresa Alarcón (Centro INAH Oaxaca)**[59]** *Preceramic Occupations in the Valley of Oaxaca and the Southern Isthmus*

Surveys and excavations during the past 12 years in the Valley of Oaxaca and the southern Isthmus of Tehuantepec provide new data on lithic assemblages and settlement distributions in these Oaxaca regions and facilitate comparison with contemporaneous sites in central and southern Mexico.

[266] *Game On: Ceramic Discoidals from the Lamar Site*

Ceramic discoidals represent a commonplace but often overlooked artifact found at many Mississippian sites. Generally, these important cultural objects are classified by archaeologists as gaming pieces. This assumption is based on European descriptions of Native American games. However, uncertainty remains regarding the function and significance of this class of artifact with no conclusive evidence that discoidals were used exclusively for games. Additionally, comparing ceramic discoidals with stone discoidals, chunky stones, or similar artifacts is problematic. An analysis of artifacts from the Lamar site near Macon, Georgia uncovered a large number of ceramic discoidals. Excavated in the 1930s, a study of discoidals from this collection provides information regarding their distribution and variety. This research contributes to our understanding of daily life during the Lamar period as well as discoidals from Mississippian contexts. Furthermore, it is important to understand how these ceramic discoidals correspond with historic descriptions of Native American game pieces. By assessing the physical properties of discoidals from the Lamar site, this study sheds light on a neglected class of artifacts.

Wisner, Meredith (University of Iowa)

[43] *Pocket Gophers as Food? The Zooarchaeological Investigation of an Unusual Woodland Period Assemblage*

The Rainbow site (13PM91) is a multi-component Middle to Late Woodland period site situated within the tallgrass prairie of northwest Iowa. Excavated in the late 1970's, the site remains an important example due to its well excavated and substantial faunal collection. The current study focuses on the reanalysis of a concentration of pocket gopher (*Geomys bursarius*) remains found within the Early-Late Woodland horizon C (AD 550–620). The surprising number and spatial concentration of pocket gopher specimens suggests that humans were responsible for their accumulation. Individual pocket gophers may have had little to offer nutritionally, however, collectively their predictable habits, visibility on the landscape, and fat content may have made them a valuable supplement during lean winter months.

[7] *The Zooarchaeology of Problematic Deposits: Ancient Maya Use of Fauna in Ritual Contexts at Group B, Xunantunich*

Zooarchaeological data provides details on the social processes related to ritual artifact deposits in the Maya area. This poster provides the results of faunal analysis on materials collected during the 2016 and 2017 Belize Valley Archaeological Reconnaissance project excavations of Group B at the site of Xunantunich. Our excavations focused on structures B1, B2, and B4, where multiple, and often layered, deposits of artifacts were located outside of the structures. Data collected includes, skeletal elements recovered, taxa present, cultural signatures such as butchery, bone tool manufacture, and bone implements or personal adornments, and natural taphonomic signatures. These data and our analyses contextualize these deposits by providing information as to whether they are middens, domestic occurrences, or rituals. We conclude by comparing the Group B deposits with similar deposits excavated in the Belize Valley at the sites of Baking Pot and Lower Dover to identify whether similar patterns are present.

Wistuk, Bronson (Binghamton University)

[300] *A Preliminary Analysis of Flaked Stone Tools at Patipampa*

The 2017 fieldwork at Huari, arguably the largest pre-contact city in South America, yielded in excess of 1800 lithic artifacts—excluding microliths found via soil floatation. These artifacts include whole bifaces, unifaces, tool fragments, and debitage. This analysis focuses on the morphologically distinct tool types excavated, such as bifacial points with lanceolate bodies, fluted points, and drills. These tool types offer insight into daily life at Patipampa and the city of Huari, potentially indicative of areas of manufacture. In one season, the frequency of flaked stone implements exceeds that found in excavating Conchopata, another Wari city in the Ayacucho Basin. Statistical and spatial analyses are used in visualizing potential significances of specific tool types.

[212] *Genome Sequencing of Ancient Dogs in the Americas to Understand Their Demographic History*

Several ancient DNA studies have been conducted on dogs in the Americas, yet all have focused on the mitochondrial genome. In this study, we sequenced 79 complete mitochondrial genomes (mitogenomes) and seven nuclear genomes of ancient dogs from more than twenty archaeological sites, ranging in age from 10,000 to 800 years before present (ybp) to gain insight into the population history of dogs in the Americas. We compared the ancient dogs' mitogenomes and nuclear genomes to those of modern dogs and wolves, and modeled demographic changes in the population over time. We found that all pre-contact dogs share a common ancestor roughly 15,000 ybp, and diverged from a closely-related Siberian dog population 1,000 years prior. Pre-contact dogs also show a closer affinity to modern dogs than to Eurasian or American wolves, further supporting the hypothesis that dogs migrated to the Americas with humans. Only a small number of American and East Asian dogs share mitochondrial haplotypes with the pre-contact dogs, suggesting that the majority of pre-contact dog diversity was lost as a result of European contact and the arrival of European breeds to the Americas.

[127] *First Foragers on the Upper Cumberland Plateau of Tennessee: Transitional Late Pleistocene and Early Holocene Lithic Technology at Rock Creek Mortar Shelter (40Pt209)*

We analyze lithic flaking debris from transitional terminal Pleistocene and early Holocene layers at Rock Creek Mortar Shelter, a multicomponent site on the Upper Cumberland Plateau (UCP), Pickett County, Tennessee. Blades, blade-like flakes, and two blade core fragments are among the lithics recovered from these contexts. Because these transitional-looking assemblages were recovered from early Holocene contexts, we believe they potentially represent groups of early Archaic peoples who were separated from other groups that also practiced blade technology, possibly before they reached the UCP. The transitional nature of the assemblages suggests that blade technology gradually went away as people became increasingly familiar with the local environment, and therefore raw material sources. We further believe that these were family foraging groups that were seasonally occupying these shelters. Thus far, lithic technological analyses reveal that older or more experienced members of the groups were teaching less experienced people stone tool production. Additionally, we seek to determine if the flake debris analysis reveals significant differences from later Holocene contexts on the UCP.

[242] *Human and Animal Foodways on the Afar Salt Route, North Ethiopia*

Caravans form an important component of ancient trade routes world-wide. They were lifelines to settlements and connected diverse landscapes. They also encouraged complex transport networks. Our understanding of ancient ways of life along these trade routes is, however, hampered by an incomplete picture of the participants or caravaners themselves. This study uses quantitative and qualitative data from ethnoarchaeological and archaeological research on the Afar salt caravan route in northern Ethiopia to recreate human and animal foodways on the route. The Afar trade route transverses the North Ethiopian highlands during the Aksumite period (400 BCE-900 CE) and the Afar desert. Today pack-based caravans transport c. 70,000 tons of salt annually. Archaeological data indicate that people at caravan campsites consumed more plant than animal based diets. Sheep, goats, and cattle were used to supplement caravan diets but were only found at logistical support settlement sites such as border towns. Caravan campsites were dominated by plant remains such as wheat and barley, grains used for making bread. The chaff of these plants, on the other hand, was used as animal feed. Fired bread making stones were also found at the site of Ona Adi Agway in Agula.

Wolff, Alice

[197] *Where Are the Brewers? Feasting and Operational Chains in Anglo-Saxon England*

The importance of alcohol in the landscape of feasting has been well documented across cultures, and early medieval Europe is no exception. The mead-hall in Anglo-Saxon Britain functioned as a location where social bonds were strengthened both vertically and horizontally; Vikings in Iceland relied on barley beer to demonstrate the power and generosity of chieftains. Production of alcohol in the large quantities required for feasting necessitates some degree of specialization, but to what degree did this specialization take on a ritual significance for the individuals involved? This paper investigates the role of brewing as part of the ritualized landscape of feasting in early medieval Europe, focusing particularly on Anglo-Saxon Britain, and considers the intersection of individual (or community) ritual practice with the use of public technology.

Wolff, Barbara

[300] *Post-Fire Incisions on Wari Pottery*

Whole ceramic vessels and sherds incised after firing are known from Middle Horizon sites in the Wari heartland and periphery, associated with offering, burial and ceramic production contexts. Incisions include a wide variety of forms and have been interpreted as graffiti, makers or owners marks, and score marks to control breakage. The presence and forms of post-fired incisions were recorded during inventory of all ceramics excavated at Huari by the Huari Urban Prehistory Program in 2017. Their motifs, vessels and contexts are described and compared with finds from Conchopata in Wari's Ayacucho heartland, Tenehaha in Arequipa, and other published examples. Significant attributes and a typology to facilitate further study are proposed.

Wolff, Christopher (University at Albany) and Donald Holly (Eastern Illinois University)

[34] *Colonizing the Edge: The Maritime Archaic Settlement and Occupation of Eastern Newfoundland*

This paper presents evidence from a new Maritime Archaic habitation site located on the island of Newfoundland, Canada. Unlike the adjacent mainland of Labrador, very few Archaic habitation sites are known from the island, which makes this work critical to understanding Archaic settlement and social organization across the broader region. Excavations have produced hundreds of lithic artifacts and geomorphological data suggesting that a variety of subsistence and domestic activities occurred at the site. A suite of AMS dates also indicates that the site was occupied during the pioneering phase of Archaic settlement on the island and revisited for several centuries. In this paper, we discuss the artifact assemblage, spatial organization, and chronology of the Archaic occupation of Stock Cove and situate it within the broader context of the colonization and settlement of far eastern North America.

[103] *Zooarchaeological Survivorship Models Using Ordered Logistic Regression*

Archaeologists investigate past hunting and herding strategies using models of animal survivorship derived from long bone fusion and/or mandibular tooth wear patterns. As biological and behavioral variation makes estimating precise biological ages problematic, researchers typically assign "age stages" that describe ranked age groups. Ordered logistic regression models take advantage of the information in these rankings to estimate and analyze patterns in ranked/ordered data based on other variables. This poster describes fitting ordered logistic regression models to zooarchaeological survivorship data using Bayesian inference (via Stan) to (a) estimate uncertainty in survivorship estimates due to sample size and (b) compare survivorship between different sites and sub-assemblages within sites. The model is also able to incorporate uncertain stage assignments using aoristic analysis; as most zooarchaeological assemblages contain specimens that cannot be assigned to a single "age stage". The ability to use uncertain stages allows aoristic survivorship analyses to combine patterns of long bone fusion and mandibular tooth wear data, despite their variable specificity. The models shown here can be adapted to any archaeological situation that uses ordered or ranked variables.

[210] *Initial Results from Magnetometer Survey at the Sacred Site of Dakajalan, Mali*

In the spring of 2017 geophysical remote sensing surveys were conducted across three locations at and around the Dakajalan sacred site, Commune Rurale de Sanankoroba, Mali in order to detect anomalies associated with archaeological features. This site has been described in oral tradition as the location where the battle that preceded the formation of the Mali Empire took place, and also where the village that acted as the first capital of the newly formed empire was located. Surface survey of various locales, including the proposed military camp, battlefield, sacred overlook, iron smelting sites, and surrounding areas was carried out. Then, small-scale magnetometry surveys were undertaken at the most promising locations. Results of these surveys not only provide information on potential archaeological features in some areas, but also reveal the benefits and difficulties of using this survey technique on the laterite-rich soils of southwestern Mali.

[20] *Shifting Palaeoeconomies at the Rockshelter Site Madjedbebe, Australia*

The East Alligator River Region has undergone considerable environmental change throughout the Pleistocene and Holocene, with changing sea levels dramatically altering the ecosystems of this region. Current archaeological models for this area indicate that people adapted their economic activities to successfully exploit these shifting environments. Throughout these changes molluscs have played an important role in the economic activities of these groups and often comprise large portions of the regional assemblages, but they have not been subject to in-depth studies. Detailed analyses of midden material from Madjedbebe, a rockshelter site, will develop a more comprehensive understanding of the changing economic role of molluscs. Additionally, this project will use the known biological and ecological information available for these organisms as environmental proxies, in combination with existing data, to reconstruct the past environments at this site and to examine and build on current models of long-term human behaviour and use of coastal resources. These detailed analyses of the molluscan material provides new lines of evidence enabling re-examination of pre-existing models for the region.

[264] *Sacred Places as Battlefields: The Role of the Ritual Landscape in Struggles for Conquest and Resistance in the Northern Transversal*

The Northern Transversal Region in central Guatemala is one of the most fertile regions of the Maya world in addition to being a key strategic point in the past and present. The rivers flowing out of the highlands provide fertile, volcanic soil in addition to natural communication routes. As a result, it has been subject to multiple waves of colonization over the past two millennia, from Classic period Tikal and Calakmul to contemporary narcotraffickers and transnational corporations. In this paper, I will summarize the ebb and flow of foreign powers and local autonomy in the region as seen through the caves, mountains, and archaeological sites that are a fundamental source of local identity and play an active role in the lives of the Maya who live around them in the past and present. As a result, they serve as microcosms of the entire region, and by understanding the history of conquest and independence of the sacred landscape one can understand the history of the region itself.

[167] *The Variable Resilience of Large and Small Holdings on the Svalbard Estate, NE Iceland: A Multidisciplinary Study of Farm Abandonments circa AD 1300*

Recent studies have identified an important reorganization of the Svalbarð estate, north-east Iceland around AD 1300. The initial coastal-focused settlement of the region was followed by the founding of new farms in the deep interior. Most were not sustained and some farm sites on the coast were also reduced. Initially, the magnate's farm of Svalbarð had a herding economy supplemented by fishing while Hjälmarsvík, its coastal neighbor, exploited a diversity of marine resources. Around AD 1300 Svalbarð became the chief consumer of the region's marine resources and Hjälmarsvík become a more specialized sheep-herding farm resembling other small farms. While this switch occurred during a period in which wool production was on the increase in Iceland, it also corresponds to a phase of climatic cooling. New geoarchaeological and remote sensing data provide a means of resolving the roles of these trends on the Svalbarð estate. These local-scale data enable us to assess inter-site variation in growing season and other landscape productivities and hence to model past landscape productivities, in reference to paleoclimate records and satellite data. In this paper, « predicted » productive potential and vulnerabilities of these farms are compared to archaeological records of occupation, land use and resiliency.

[94] *Risk and Failure in the Classroom: Exploration, Scholarship, and Active Learning*

For at least the past decade, college campuses have been inundated with buzzwords like active learning, flipped classroom, metacognition, and learning-centered teaching. While these concepts and the related pedagogical techniques can be highly successful there are many barriers to effective implementation, particularly in large introductory-level classes. Two of the most significant barriers are enculturation of both students and instructors to expect certain forms of classroom interaction and the content rich nature of most introductory courses. These barriers make experimentation with active learning seem particularly risky for both students and instructors. I discuss general approaches to overcoming these obstacles, including modeling the exploratory nature of scholarship and encouraging student-led inquiry that builds knowledge of basic content. In addition, I provide

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

examples of four specific techniques I use that encourage active learning: in-class activities, debates, group presentations, and targeted written assignments. I evaluate the costs of each in terms of both class time and instructor effort, and discuss their benefits in relation to student learning outcomes. While I created these activities for my college classes, I have used variations successfully in several settings and with students as young as first grade.

Worthey, Kayla (University of Arizona)

[304] *Stable Isotope Analysis Applied to the Reconstruction of Paleoenvironment and Landscape Use during the Middle and Early Upper Paleolithic at Üçağızlı I and II, South-Central Turkey*

Stable isotope analysis of $\delta^{13}\text{C}$ and $\delta^{18}\text{O}$ in herbivore tooth enamel from the archaeological sites of Üçağızlı I and II in south-central Turkey is used to explore human responses to environmental change during MIS 3 in the eastern Mediterranean. Although changes through time in local ambient moisture are associated with changes in the local animal communities, they generally do not correlate with proxies for site occupation intensity, and thus do not indicate depopulation or shorter site stays during times of aridity. The Ahmarian occupation at Üçağızlı I, however, is identified as an anomalous interval due to its high levels of environmental moisture, intense site occupations, prey animal representation, and unique exploitation strategies for lithic raw materials indicating a change from residential to logistical mobility. The reorganization of mobility strategies during the Ahmarian may relate to a local expansion of forested habitats.

Wren, Colin (University of Colorado—Colorado Springs)

[219] *Landscape Connectivity, Habitat Suitability and Cultural Transmission during the Last Glacial Maximum in Western Europe*

During the Last Glacial Maximum the population of Western Europe contracted its range as the climate became less hospitable and more unpredictable. Mobility decisions must have been a key part of human adaptation during this time but are notoriously difficult to extract from archaeological data. Agent-based modelling offers one way to explore human mobility heuristically, producing test implications that can be tested using the archaeological record. We use a model of habitat suitability derived from archaeological site distributions, paleo-climate simulation data and environmental predictors to derive a GIS landscape (Burke et al. 2017). We then use an agent-based model to explore how this heterogeneous landscape affected patterns of inter-regional mobility and cultural transmission. We look at the impact of different mobility strategies, mobility radius, and the dynamics of cultural transmission to better understand the social context of the LGM's archaeological record.

[91] *Hohokam Dry Farming along the South Mountains Bajada, South-Central Arizona*

Hohokam communities who resided alongside the perennial rivers in south-central Arizona are renowned for the massive canals they engineered and operated, representing some of the largest preindustrial irrigation systems in the world. In light of such achievement, dry farming technologies and practices remain a lesser known component of the Hohokam agricultural landscape. This paper takes a close look at recent fieldwork around the South Mountains, an upland setting at the confluence of the Salt and Gila Rivers. Surface survey has identified a range of dry farming features and associated plant processing facilities along the northeast and southwest bajadas. Pollen and phytolith analyses of soils from several of the farming features identified maize and agave as cultivars. They also suggest Hohokam agriculturalists used these facilities to encourage certain economically important wild plants. Macrobotanical analysis of material from associated roasting pits implies some of the agave was processed and possibly consumed on-site, a ritualized practice carried on by historic and modern-day O'odham communities. Diagnostic artifacts associated with the farming features and recovered from within the cooking facilities indicate Hohokam agriculturalists in the Phoenix Basin were dry farming agave, and potentially maize, by AD 950, and possibly as early as AD 750.

Wright, Alice (Appalachian State University) and Colin Quinn (Hamilton College)

[196] *Confronting Myths of Isolation in Pre-Columbian Appalachia*

In recent decades, ethnographers, historians, and historical archaeologists have refuted popular myths about southern Appalachia that characterize the region as an isolated geographic periphery and, by extension, a cultural backwater. However, these perceptions continue to color interpretations of Appalachia's deeper past, despite the region's long tradition of rigorous archaeological research. Some scholars have suggested that pre-Columbian Appalachia has remained peripheral in archaeological discourse because it comprised the geographic edge of different cultural expressions (e.g., Mississippian, Morrow Mountain) or interaction spheres. In this paper, we argue that Appalachia's recurring position as a cultural boundary renders it uniquely suited for studying pre-Columbian interaction and connectivity. Drawing on spatial and contextual data from the New River headwaters of northwestern North Carolina, we attempt to reframe the southern Appalachians as socially and symbolically central to Woodland period events and histories, and we propose new lines of archaeological research to further interrogate erroneous impressions of the region's inaccessibility, isolation, and cultural inertia.

Wright, David (Seoul National University)

[161] *Archaeology in the Age of the Anthropocene: How I Learned to Stop Worrying and Love the Bomb*

The 2016 decision by the Working Group on the Anthropocene of the International Commission on Stratigraphy (ICS) to designate an Epoch based on a Global boundary Stratotype Section and Point (GSSP) fixed at AD1950 is significant for managing global ecological systems moving forward. There is no serious scientific debate on whether humans have impacted the global ecology, but regardless of the ICS decision to anchor the so-called "Golden Spike" to the advent of the nuclear age, humans are known to have profoundly altered landscapes at deep timescales. Three examples are presented from the African continent: the Middle Stone Age (Pleistocene) of northern Malawi, the Neolithic (early Holocene) of the Sahara and Iron Age (late Holocene) of northern Cameroon in which the concepts of boundaries and potential impacts of human activity are challenged. Human impacts on ecological systems are qualitatively analogous to other keystone species, but quantifiably larger based on our control of fire and other forms of coppicing as landscape management tools. Although coppicing may not meet the GSSP standard, its accumulated global effect on landscape species composition has altered earth's environmental matrix as significantly as nuclear weapons.

[154] *Using XRF Analysis on Historic Choctaw Ceramics from Chickasawhay Creek, Kemper County, MS*

In partnership with Tennessee Valley Archaeological Research (TVAR), this poster presents the results of an x-ray fluorescence spectrometry (XRF) analysis of ceramics recovered from historic Choctaw (Late 17th—Early 19th century) contexts at sites (22KE630 and 22KE718) located along Chickasawhay Creek, Kemper County, MS. In the fall of 2017, a sample of ceramic sherds was selected for chemical sourcing at the University of Alabama. XRF was used to non-destructively identify ceramic compositional groups from the sample. In this poster, we discuss our methodology and

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

present preliminary interpretations of how these chemical profiles demonstrate changing choices in clay exploitation based on differences in vessel form, function, and chronology.

Wright, Kyle (USDA Forest Service—Shoshone National Forest, Wyoming) and Lawrence Todd (Research Associate, Draper Museum of Natural History)

[106] *Bounding Uncertainty and Ignorance: Archaeology and Human Paleoecology in Washakie Wilderness, Shoshone National Forest, Wyoming*
In the early 21st Century, the Washakie Wilderness, which encompasses roughly 2850 km² of the Greater Yellowstone Ecosystem, was a virtual blank spot on the map of prehistoric archaeology with only three sites reported and no systematic inventories having been completed. By 2017 cooperative investigation between the Shoshone National Forest and Greybull River Sustainable Landscape Ecology (GRSLE) has completed 16 field seasons in the Washakie and documented 388 previously unknown prehistoric sites in nearly 1700 ha block inventory areas. The GRSLE project focuses on artifact-based documentation and has recorded locational and descriptive data on over 120,000 pieces of chipped stone as our base dataset. Artifacts range in age from Paleoindian through Protohistoric and are found as both small scatters and extensive occupation sites. With only about 0.6% of the Wilderness having been systematically examined, we are just beginning to glimpse the range of variation in artifact locations, attributes, and regional assemblage properties. In addition to a small sample size, recent climate driven changes including large wildland fires and melting alpine ice patches add to our interpretive uncertainty in reconstructing prehistoric use of the Washakie other than to say it was neither marginal nor subject to limited short-term human use.

[14] *Collaborating with Descendant Communities to Explore the Biological Heritage of Enslaved People at James Madison's Montpelier through Ancient DNA Analysis*

Over the past 30 years, historical archaeologists have studied the sites and material remains of enslaved people from across the American South. Recently, archaeologists have actively worked with descendants in this research, including excavation and archaeological interpretation. However, little has been done to build the connection between biological and historical heritages of enslaved people and their descendants. In this study, we utilized ancient DNA methodology to contextualize the maternal ancestry of three teeth that were discovered at James Madison's Montpelier. The teeth were recovered from non-burial contexts associated with enslaved people living and working at Montpelier during the 18th and 19th centuries. Before DNA extraction, the teeth were 3-D scanned and printed to preserve their morphology in digital form. The genetic analysis of the tooth remains not only expands the breadth of knowledge about slavery in the US, but also provides an opportunity for archaeologists and a community of descendants from Montpelier to collaborate in a new way. Therefore, this study illustrates how the knowledge from a genetic study can be of value to both the academic and public settings.

Wrobel, Gabriel (Michigan State University)

[101] *The Maya Cranial Photogrammetry Project*

The Maya Cranial Photogrammetry Project aims to create a large digital repository for the purpose of comparative shape analyses to test hypotheses relating to ethnic and political distinctions among ancient Maya groups. The shape of skeletons reflects a combination of genetic and environmental influences on development and thus comparison of skeletal variability provides an important means to reconstruct microevolutionary processes. In particular, because of its complex morphology the skull has been the focus of evolutionary biology studies, including those focused on humans. Most often in anthropological contexts, size and shape variables are quantified and compared as part of biodistance studies, relying on the basic assumption that people sharing similar morphological features share a common ancestry when compared to groups with fewer shared features. My study utilizes metric and non-metric data collected digitally from 3D photogrammetry models of crania and mandibles to perform biodistance analyses, which will allow me to map the genetic relationship between geographically-bounded and culturally distinct subgroups within Mesoamerica. Observers will have the opportunity to explore and manipulate the 3D models on a computer and will also be exposed to various visualization options for comparing shape variations.

[45] *Long-Distance Human Migration in Late Neolithic China: Isotopic Evidence from Qingliangsi Cemetery*

Around 2200BC, Qingliangsi is a large settlement to the north of the Yellow River with wealth accumulation and social stratification. The location of the site close to rich salt resources made the location a draw for emergent elites during the late Neolithic. Among the most significant lines of evidence of emergent stratification are remains of human sacrifice found in the Qingliangsi cemetery. Our carbon, oxygen, and strontium isotope analyses of human remains excavated from Qingliangsi show that some of the elites and the sacrificed juveniles during Longshan period may have come from regions near the Yangtze and Huai Rivers. Our results delineate the complex demography in Qingliangsi and reveal population movement over long distances driven by salt resources. The unusually rich salt resources in North China may have played a vital catalytic role in this evolution. Wurst, LouAnn (Michigan Technological University) and Stephen Mrozowski (University of Massachusetts Boston)

[247] *Historical Archaeology of Capitalism and Climate Change*

Much of the climate change literature focuses on whether it is an empirically verifiable process or how individual's behavior can ameliorate the impacts. Our common approach abstracts the environment, economy, society, and individuals as external relations that posit the cause and effects of global warming as categorically separate from endemic global poverty, starvation, and income disparities. Instead, we argue that discussions need to bring together all the social and natural aspects that people tend to abstract as separate; to see capitalism as an internally related dynamic totality. The unforeseen consequences of an ever-expanding economy built on the accumulation of wealth is that one of its "products" is the concentration of toxic gases that have contributed to global climate change. Historical archaeology provides a powerful set of vantage points from which to critically examine

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

the history of capitalism in motion and case studies that can help people understand that climate change is both an internal and necessary to the laws of capitalist motion.

Wyatt, Andrew (Middle Tennessee State University)

[254] *In the Garden: Studies in the American Neotropics*

Gardens are spaces where households grow plants for food, medicine, and beauty. They provide subsistence as well as economic benefits. However, gardens are more than just economically functional. Gardens are also spaces where families interact and children are socialized, gender and status are negotiated, and ancestral memories are maintained. Archaeologically, soil chemistry, archaeobotany, and spatial analysis have enabled us to identify the locations of gardens, but addressing more anthropologically oriented questions is necessary to situate these important spaces within the household.

This presentation will discuss the history of garden studies in the American Neotropics, how archaeologists have refined their methods in identification and analysis, and how they have attempted to address more theoretical and anthropological questions. I will then present both ethnographic and archaeological data from the Precolumbian Maya site of Chan in Belize, the contemporary Lacandon Maya community of Lake Mensabak in Chiapas, Mexico, and several Precolumbian sites in Gurupá and Caxiuana, Brazil to demonstrate how we can move beyond questions of identification to discussions of meaning.

[31] *Tlaxcallan Pottery Manufacture and Restricted Networks*

The debate whether pottery sherds equal people or just their ideas has been ongoing since the days of pioneers such as Ford and Spaulding. The advent of new technologies has given a new wind to old debates in which the questions surrounding pottery styles are examined more closely to determine their origin. Compositional analysis has been especially helpful in shedding new light on the relations between artifacts and people. Compositional analysis carried out on Postclassic Tlaxcallan pottery from surface collections is compared with visual identification carried out in the initial technical analysis of the assemblage. While that initial analysis identified varied points of origin for stylistically foreign pottery, compositional analysis eliminates the probability that these styles were imported from faraway places, and increases the likelihood that their production was more localized, possibly tapping clay sources within Tlaxcallan itself or nearby sources. This possibility supports the idea that Tlaxcallan's access to foreign goods was limited as Aztec power increased, but also that there seems to have been a demand for these foreign objects that was met with entrepreneurial ingenuity by Pochteca merchants.

Xu, Jian (Sun Yat-sen University)

[336] *Formation of Early State in Highland Southwest China: Rethinking Yelang Culture*

Recent archaeological discoveries in Guizhou, China have moved some scholars to describe and argue for the material existence of a legendary state, Yelang; roughly contemporary with Chinese powers from the late Eastern Zhou to the early Western Han dynasty. Except for precious objects reserved for high ranking people, traditionally-identified indicators of early urban civilizations are largely absent in Guizhou. If the appearance of luxury objects and their applications in well-regulated contexts connote the existence of a state or proto-state, that dramatically differs from states or proto-states in either Central China or in the written accounts of Yelang. This presentation aims to define the archaeological appearance of an early Bronze-age state in the highlands, based on information collected from several sites in Guizhou.

[38] *Rails and Trails: Archaeology of the Central Pacific Railroad along the Humboldt River*

The Humboldt River was a significant transportation route used for the movement of information, goods, and people from prehistoric through modern times. Continual use of the river as a transportation node is due to its west-southwest direction, which provides one of the few natural corridors across the Great Basin. Because of the relatively flat topography, the Central Pacific Railroad Company, motivated by the ideals of nationalism and capitalism, built their line along the Humboldt River corridor. Documenting the location and condition of the Central Pacific Railroad (CPRR) is critical to preserving and protecting this historically significant resource. However, the CPRR, including its associated features and artifacts, is more than a historic scar on the landscape; it is a clue to the social, economic, and political conditions of the late nineteenth century. Many of these historic situations can be examined from an archaeological perspective through landscape analysis. As one of the last large-scale construction projects completed by manual labor in the United States, archaeological studies of the Central Pacific also provides details on the lives of groups marginalized by history, including the Chinese laborers who worked on the line.

Yaeger, Jason (University of Texas at San Antonio) and M. Kathryn Brown (University of Texas at San Antonio)

[258] *Archaeology, History, and Ancient Political Dynamics of the Mopan River Valley*

One hallmark of Joseph Ball's research has been integration of archaeological data and ethnohistorical and historical data, put to the service of addressing larger anthropological questions. In this paper, we present new data to examine one research question studied by Joseph Ball and Jennifer Taschek: Classic Maya political dynamics in the Mopan Valley of western Belize. This valley was home to five large centers, spaced 1 to 5 km apart: Las Ruinas de Arenal, Early Xunantunich, Classic Xunantunich, Actuncan, and Buenavista del Cayo. Ball and Taschek conducted extensive fieldwork at Buenavista and Arenal, and they proposed a model of the valley's political structure as comprising a single polity with functionally distinct settlements. Following in their footsteps, we have conducted research at all of the sites listed above. We present new archaeological and epigraphic that allow for a more nuanced model of the valley's political organization. We also examine how the ideological basis of political authority and the relationships between the region and outside kingdoms both changed significantly over time.

[225] *Origins and Movement of Tradeware Ceramics in the Bicol River, Philippines: Applying pXRF Technology to Trade and Interaction Research*
The presence of tradeware ceramics (stoneware and porcelain) in the Philippines indicates interaction and exchange with foreign traders. Of particular interest is the spread of Ming (1368–1644) porcelain, which overlapped with the Spanish colonization of the Philippines. Ming ceramics are abundant in the archaeological record of the Philippines, spanning pre- and post-contact periods. These ceramics even became one of the major trade items during the Spanish Philippines. To establish the movement of these goods in the Bicol Region and adjacent Southern Tagalog Region, I utilize portable X-ray fluorescence to analyze tradeware ceramics from sites adjacent to the Bicol River. Elemental analysis of tradeware ceramics excavated at various Philippine sites, as well as collections obtained from salvage archaeology, may provide insights into where these ceramics were made, who was trading them, and the nature of their movement across the archipelago. For comparison, I also analyze tradeware ceramics from archaeological sites in nearby Southern Tagalog Region. Through this analysis, I expect that the elemental composition of Ming porcelain in the Philippines will provide a glimpse of the exchange relationships between the sites investigated. Furthermore, these markers of culture contact are important to understanding the role of exotic, nonlocal goods in Philippine society.

Yamamoto, Atsushi

[178] *Emergence of Sociopolitical Complexity in Northern Peru: A Diachronic Perspective from the Huancabamba Valley*

This paper focuses on the emergence and diachronic development of sociopolitical complexity in northern Peru during the Initial Period and Early Horizon using new excavation and settlement pattern data from the site of Inгатambo in the Huancabamba Valley. I argue that significant changes in sociopolitical complexity occur alongside shifts and intensification in interregional interaction.

During the Pomahuaca phase (BC. 1200–800); ceremonial centers with platform architecture appear suddenly throughout the valley alongside the expansion of roads and long distant interaction networks. By the subsequent Inгатambo phase (800–550 B.C.), the number of ceremonial centers in the valley decreased despite the florescence of monumentality at the site of Inгатambo and the increase presence of foreign pottery and other exotic materials. This data suggests that the long term development of sociopolitical complexity within the Huancabamba Valley was strongly linked to its interregional relationships and that Inгатambo, as a result of its strategic location, would eventually grow into a major node for both inter-regional and intra-regional interaction.

Yao, Alice (University of Chicago)

[181] *How to Dig a Drinking Well: Watery Politics on China's Han Frontier*

Water plays an undeniable role in the constitution of politics and society, presenting an elemental force to be controlled for the expansion of agrarian economies. The political life line linked with water is perhaps nowhere better illustrated than with the Han Empire whose massive canalization and irrigation works were necessary to facilitate state expansion into deserts and tropics. The archaeological focus on water and agrarian infrastructure has however overlooked other capacities of water, for instance, as a potable substance in the production of life. Because an anthropocentric viewpoint begins with water as a matter of control, water appears as an object existing independently of the wider physical phenomenon. However, if archaeologists are to approach imperial projects as involving new ways of perceiving difference, this paper argues that water presents a contentious form at the intersection of frontier ecologies. Shifting away from infrastructures of water, this paper explores how water forms distinctive assemblages in colonial households beginning with the building of drinking wells in a newly established frontier. Where and how deep and wide to the shape of a well confronted Han settlers with water's tangibility, an encounter which enmeshed people with water's less controllable presence in soils and plants.

[261] *Using the Past to Inform the Future: Employing Empirical Data to Guide Future Land Management Decisions*

This presentation will explore the opportunity to increase scientific driven data into the National Historic Preservation Act (NHPA) Section 106 compliance process particularly relating to Bureau of Land Management (BLM) undertakings. The absence of empirical data available to the BLM to analyze how different activities' development and/or management affect archaeological sites can result in unfounded assumptions and unnecessary complications during project planning and implementation. Using cases studies from BLM Colorado among other states, this presentation will provide the basis for highlighting the need for additional cultural resource impact studies as well as the advantage of a more scientific approach in federal cultural resource management. Federal agencies, such as the BLM, would greatly benefit from additional resource studies that promote a science driven approach to the Section 106 process. This empirical focus will lead to greater transparency and would overall foster better relations within the BLM, and with State Historic Preservation Officers (SHPO), local governments, communities, tribes, and other stakeholders.

[59] *Formation and Context of Sitio Chivacabe, Western Highland Guatemala*

Located in the Highlands of western Guatemala, Chivacabe is a Pleistocene-age bone bed and Archaic-age archaeological site. In 2009 the site was subjected to intensive geoarchaeological investigation with the goals of identifying the relationship between the faunal and archaeological remains through developing an understanding of their context. Three allostratigraphic units were identified: The oldest unit, which contains the bone bed, consists of colluvially reworked tephra bracketed by radiocarbon dates of 15,700 and 12,920 years BP (Cal. 2-sigma). The middle unit, marked by a prominent Btkb horizon, minimally dates to 10,190 years BP and likely contains the archaeological materials. The youngest unit truncates the underlying middle unit and represents relatively recent or Late Holocene erosion and deposition. Overarching conclusions from the 2009 geoarchaeological investigations include confirmation of the faunal remains in reworked tephra and dissociation of the bone bed and archaeological materials.

[101] *Big Picture, Little Picture: Reconstructing Rock Art and Context in Both the Virtual and Physical Word*

This presentation explores the ways in which 3D reconstruction can succeed as an innovative platform for both archaeological study and public engagement using a case study from the Hiwassee River watershed, North Carolina. The project, initiated by the Tribal Historic Preservation Office (THPO), Eastern Band of Cherokee Indians (EBCI), involves an effort to repair a vandalized petroglyph panel. The rock art panel is a complex composition of incised, interwoven petroglyphs from which a 1.5 m section was removed and carried off-site. The removed section was recently returned to the EBCI, and it was decided that an effort should be made to restore the panel to its original location. Photogrammetric 3D reconstruction was selected as the best method to non-invasively model repair efforts, and also provided a unique opportunity to study the petroglyph forms, and provide the basis for an interactive experience for members of the EBCI community.

Rock art sites and panels make a natural pairing with 3D reconstruction for archaeology, because the study of rock art requires visual and spatial analyses. Additionally, the visually striking, and often enigmatic, nature of rock art generates much public interest—making it an excellent vehicle for public archaeology and interactive virtual reality projects.

[124] *Contextual Taphonomy in Zooarchaeology: From Refuse Behavior to Site-Occupation Intensity in Levantine Epipaleolithic Camps*

In zooarchaeology, Contextual Taphonomy means the integration of the stratigraphic and contextual data with zooarchaeological and taphonomic data, to clarify the 'life history' of a faunal sub-assemblage in a given context. The approach uses animal remains to explain variability among site features by looking into the differential taphonomic histories of the bones, most importantly in the post-discard stage. Archaeofaunal remains are normally ubiquitous in foragers' camps and their histories are readily deciphered, potentially making them excellent indicators of site-formation processes, refuse behavior and activity areas and, by extension, of site type and occupation intensity. A contextual taphonomy approach was recently applied to Late Epipaleolithic (Natufian) animal remains in Mount Carmel, Israel (ca. 15,000–11,700 cal. BP) in order to discern the formation and function of architectural contexts of these semi-sedentary foragers. At the Natufian basecamp of el-Wad Terrace, the contextual taphonomy approach identified fluctuations in site-occupation intensity through the 3,500-year-long Natufian sequence of the site. It also showed that a sequence of structures was used for everyday living activities, probably at the household level. Conversely, at the Natufian cemetery site of Raqefet Cave, the animal remains reflected short and punctuated periods of human activity, corresponding with a specialized burial site.

[24] *Research on Materials and Manufacturing Process Used for the Imperial Inlaid Jade Lacquered Wooden Coffin from the Royal Mausoleum No.2 of the Vassal King of Jiangdu State of the Western Han Dynasty in China*

The paper focuses on the characterization of material from fragmented pieces of the imperial lacquered wooden coffin excavated in Xuji County, Jiangsu Province, whose owner was the empress of Jiangdu State in Western Han Dynasty. The samples were analyzed by scientific techniques including optical and electron microscopy, XRD, FT-IR and GS-MS. The lacquer film outside consists of a seven-layer structure, which includes (from the top): a red pigmented layer, two lacquer finish layers, three ground layers and a canvas foundation layer. The red motifs on the surface are painted by cinnabar. The lacquer finish layers are made of urushi and amorphous. The three layers of ground are feldspars, hydroxyapatite and feldspars mixed with urushi respectively and there is a layer of organics between every two of them. The foundation layer is identified as a plain weave fabric made of bast fibres. Our study revealed the manufacturing process of Chinese traditional lacquering of Vassal King in Western Han Dynasty.

[54] *Long-Distance Trade in Late Antique Italy: Evidence from the Bova Marina Archaeological Project*

It is well known that the state plays a major role in generating and structuring economic flows in complex societies. What happens, though, when a state's ability to do this is severely reduced? One example to consider is the Roman/Byzantine state in Late Antiquity. Using survey evidence from the Bova Marina Archaeological Project, changes in the presence of long-distance imports in the ceramic assemblage show a drastic shrinkage of the scope of trade, while other economic changes were less dramatic or more gradual.

[178] *Ecology and Human Habitation of Andean Forests*

People have altered the naturally forested areas of the tropical Andes for natural resources and as places for settlements. The forests collectively represent a global biodiversity hotspot, with many unique species. Environmental gradients are abrupt, with dramatic changes in temperature regimes with altitude, but also with switches in humidity from dry to pluvial depending on exposure to prevailing winds. The steep environmental gradients create dispersal barriers to plants and animals, resulting in highly restricted distributions. Along the >3000 m altitudinal gradient, there are zones where cooling air can form persistent fogs, leading to cloud forests that have moisture-dependent species and low stature trees, which nevertheless provide important ecosystem services. The relatively cool temperatures and steep slopes at higher elevations often discourage human colonization, but some sites include archaeological sites, suggesting that current land use may not be prescriptive of the past. Nonexclusive factors may include past climate change, enclaves with drier microenvironments, transhumance, and use of multiple ecological zones. Given a long history of Andean landscapes with people, it is important to put conservation and sustainability goals into a larger context, including data on the timing and locations of settlements, and conceptual models of human influences on Andean forests.

[141] *From Near and Far: Application of Archaeometric Techniques to Characterize Regional and Long-Distance Interaction at the Formative Period Center of Atalla, Peru*

This paper investigates the role of interregional interaction in the development of social complexity in the Central Andes during the Late Initial (c.1100–800 BC) and Early Horizon (c.800–200 BC) periods at the archaeological site of Atalla, a regional ceremonial center located in highlands of Huancavelica, Peru. Methodologically, this research integrates radiocarbon dating with stylistic, technical, and geochemical analyses of a range of materials to examine exchange and interaction on multiple scales. Formal and technical analyses of ceramic styles are compared with petrographic analyses of these ceramics, allowing the investigation to distinguish imported wares from local imitations of foreign styles. NAA and XRF analyses of obsidian flakes and tools reveal regional patterns of obsidian exchange and acquisition. The use of pXRF to verify the composition of decorative pigments illuminates temporal and spatial patterns associated with the exploitation, processing and exportation of cinnabar. The results from these combined analyses will present a more holistic understanding of regional networks and long-distance trade than the sourcing of a single material could offer. This study aims to characterize interactions with foreign communities and to explore the relationship between these interactions and the emergence of social complexity at the site of Atalla.

[300] *Architectural Style and Urban Organization at the Patipampa Sector of Huari*

Defining spatial organization was a key research question for the excavations at the Patipampa sector of the Middle Horizon (AD 500–1000) site of Huari in the Ayacucho valley of Peru. In the 2017 excavations we used methods designed to expose the upper portions of walls, in order to define architectural spaces and clarify organization of the sector. Some architectural spaces were excavated more completely, fully exposing walls and architectural features.

Our excavations revealed distinct architectural styles defined by differences in scale, construction materials, and construction techniques. Analysis shows clear linkages and relationships between structures with distinct architectural styles that are maintained across time. Differences in construction materials and techniques are frequently understood to indicate distinctions in the use and purpose of buildings, and differences in who could use those buildings. Our findings at Huari challenge these assumptions, showing that finely constructed buildings and spaces with distinct architectural features were at times integrated with more quotidian architecture.

This paper will define the architectural styles at Patipampa, demonstrate how buildings with distinct architectural styles are related to one another, and explore what these findings can tell us about the everyday life of the early urban inhabitants of Huari.

[225] *Connecting the Dead: A Comparison of Pre-dynastic Nubian and Egyptian Cemeteries*

In the early 20th century, seminal Egyptologist George Reisner excavated a series of predynastic cemeteries west of the Giza plateau and farther south in modern day Sudan. While some objects from specific cemeteries were published in original manuscripts, the majority of artifacts currently housed in Harvard University's Peabody Museum remain unstudied. Through a combination of ceramic analyses, including petrography and stylistic analysis, we situate these assemblages within a discussion of intra and inter-cemetery patterns during the predynastic period. We present a study of contextualized ceramic material from selected cemeteries, such as Keneh, Sheikh Farag and Kerma, to elucidate the relationships between Egyptian and Nubian funerary material culture during the predynastic period. We aim to identify indications of connectivity, movement of goods, and transmission of technology between pre-dynastic Egypt and Nubia. We situate this comparison within a discussion of the known mortuary characteristics, practices, and organization of Nubian and Egyptian cemeteries. We aim to underline possible channels of trade of goods and the social and cultural meaning of the exchanged objects. Our objective is to contribute to the study of interconnection and relationship between Egypt and Nubia more broadly, through the study of the ceramic material from a funerary context.

Zaneri, Taylor (New York University)

[40] *Producing the City-State: GIS Modeling of Rural Land Use in Medieval Tuscany*

From 900 to 1300 AD, Italy underwent sweeping cultural changes—the rise of market economies, increased trade and commerce, and new forms of governance. Typically, the elite are cast as the drivers of these shifts, yet it was rural labor that produced the goods (particularly foodstuffs) traded in the cities, collected in the form of rent and taxes, and transformed into capital. This paper examines the impact of rural landscape strategies during the development of the medieval city-state of Lucca. Historically Lucchese rural producers had greater autonomy compared to their counterparts elsewhere in medieval Europe when it came to land choices and production. Using environmental models constructed in GIS, I examine rural settlement location in relation to land suitability for three major cultivars consumed in urban Lucca: vines, olives, and wheat. From 900 to 1300 AD, the period of city-state formation, I explore if and how rural settlement shifted to areas better or less suited to these crops, analyzing if rural producers changed their landscape occupation to engage with urban markets. In summary, I investigate the impact of the periphery on the center, by asking how rural landscape use impacted and interacted with urban transformations.

[33] *Un acercamiento al pensamiento simbólico de los Huastecos, siglos XV y XVI*

Definir una región tan antigua y compleja como la Huasteca, implica conocer las características de los grupos humanos que la habitaron; en ella existen diversas manifestaciones culturales a través del tiempo; en esta ocasión presento un primer acercamiento al mundo simbólico que encontramos durante el período Posclásico.

Inicié el estudio utilizando cuatro indicadores arqueológicos: Vasijas de cerámica, Concha labrada, Pintura Mural y Escultura. Lo primero que hice fue reconocer los símbolos que se encontraban en ellos y decidí iniciar con 24 representaciones que agrupé de acuerdo con su frecuencia, para así ir abordando la investigación sobre estos testimonios; empezando un catálogo que da una idea de los elementos que concibieron.

De esta manera emprendo un primer acercamiento hacia la interpretación de representaciones simbólicas en los indicadores, pretendiendo acercarme a sus significados a través de la identificación iconográfica de los símbolos considerados.

Con las referencias bibliográficas de esta región y para otras partes del México Antiguo, he intentado reconocer algunos de los símbolos plasmados, con el fin de poder adentrarme en el pensamiento simbólico de la Huasteca prehispánica.

[331] *Rock Art Out of Its Element? Exhibiting Places in Museums*

Unlike most material culture, rock art is firmly embedded in its place. This particular circumstance has shaped its research, as well as its reception among the general public. While famous sites, such as Lascaux, are well known and recognised despite difficulty in accessing them, other sites, especially those in Canada, are still relatively unknown. This paper will briefly address how rock art has been consumed and presented to the general public within Canada. Next, I will address how this heritage can be brought to millions through the medium of a virtual exhibit. I will then discuss the project of a virtual exhibit that has been undertaken by the Musée de la civilisation and Université du Québec à Montréal and I will focus on the advantages and challenges that new technologies can create in how rock art is presented, preserved and ultimately understood.

[264] *Alligators, Serpents, Pirates, and a Wedding: Ritualized Political Landscapes of the Oaxacan Pacific Coast, Mexico*

Straddling maritime, lowlands, and highland environments, the neighboring Chontal and Huave ethnic groups occupy one of the most diverse landscapes in southern Mexico. For over five centuries this resource-rich territory served as a junction for Indigenous and European colonial encounters, where interethnic and intercontinental political alliances and conflicts came forcefully into play. In addition to leaving material remains scattered throughout the landscape, this political history was encoded in ritualized performances still practiced today in these coastal communities, as well as in their oral traditions and territorial-narratives. Our interdisciplinary research project in the region demonstrates that mountains, caves, lagoons, and the ocean itself served as portals for both animal and human agents, moving and operating in between the physical and spiritual realms. In turn, these animated palimpsests serve as mnemonic devices to recount and reshape social relations and ancestral memory.

Zeanah, David (California State University, Sacramento)

[92] *Understanding Prearchaic Mobility and Settlement Patterns: The Role of Theory, Models, and Ethnographic Analogies*

Most evidence suggests that Prearchaic hunter-gatherers were highly mobile, and equipped with a hunting oriented lithic technology that lacked milling equipment. Nonetheless, they acquired a broad spectrum of prey and tended to camp near wetlands rich in small game and plant resources.

Archaeologists have questioned to what degree this evidence reflects an adaptation that fundamentally differed from ethnographically observed patterns in the Great Basin, as well as whether it was shaped primarily by social and political, rather than subsistence needs. We argue that the Prearchaic cannot be understood by direct analogy with ethnographic Great Basin foragers because they lived in climatic circumstances and at population densities utterly unlike those of recent times. An alternative theoretical approach informed by behavioral ecology and validated with data on global variability in hunter-gatherer mobility can yield testable expectations. Such an approach should be founded on the expectation that both social and economic incentives play critical and non-contradictory roles in structuring the settlement patterns and mobility strategies of low population density hunter-gatherers.

[17] *Partnerships for Patrimony: Developing a Methodology for Creating Sustainable Archaeological Site Preservation in the Central Highlands of Peru*

The growing popularity and lucrative potential of heritage tourism has made sustainability a growing concern for archaeologists, site managers, politicians, local communities, and other stakeholders including transnational individuals. However, heritage management professionals in often employ the term 'sustainable' synonymously with 'collaborative' rather than as a coherent methodology or strategic approach aimed at preserving heritage sites and landscapes. The thinness of the literature on sustainable archaeological site management may pertain to the difficulty heritage managers have in articulating frameworks as advocated for in the prevailing decolonization and indigenous theory underpinning heritage-based sustainability efforts. Throughout Latin America, this problem is further complicated by a distinct historical-colonial legacy that preserved the 'local' as well as the 'indigenous' and promulgated a criollo, or mestizo, identity as the unifying national figure of public imagination.

This paper presents original ethnographic, archaeological, pedagogical, and economic research on the outcomes of English-based theory on Spanish-speaking contexts, ethnographic research into local identities regarding pre-Hispanic archaeology, challenges to democratizing an authorized heritage discourse, and projected outlooks as they pertain to the site of Huari and the neighboring town of Pacaycasa in the Ayacucho region of Peru in the Central Andes.

Zeidler, James (Colorado State University)

[295] *Deep Histories and Persistent Places: Repetitive Mound-Building and Mimesis in the Jama Valley Landscape, Coastal Ecuador*

This paper explores the notions of 'material memory' and human agency in deep time as expressed in the repetitive reconstruction of earthen platform mounds over some three millennia in the Jama Valley of coastal Manabí Province, Ecuador. Empirical evidence of repetitive mound-building is presented over a long stratigraphic record extending from approximately 2030 BCE to about 1260 CE, and special emphasis is given to the site of San Isidro, a major civic-ceremonial site and 'persistent place' located in the central Jama Valley. This long archaeological sequence is punctuated by evidence of three separate volcanic disasters and subsequent hiatus periods of valley abandonment. Repetitive rebuilding of monumental architecture was carried out by peoples of different cultural traditions that colonized the valley several hundred years after each natural disaster, represented by the Formative Period Terminal Valdivia and Chorrera cultures, followed by the long Jama-Coaque tradition. Finally, consideration is given to Dušan Borić's (2002) argument (following Gell 1998) that such repetition and citation of past monumental material culture, as well as its mimetic representation as miniaturized art forms, have apotropaic or protective properties that benefit society at large, or social groups and individual agents within that society.

[167] *Iron Production at Marginal Settlements in Northern Iceland*

The environment of Iceland was rapidly and severely affected by the Norse Settlement, in particular by deforestation. In Iceland's changing environment the production of iron, an essential material, became limited not by access to iron ore but by availability of wood to make charcoal fuel. The large-scale production of iron may be one of the primary processes that led to deforestation in Iceland due to the large need for charcoal. Investigations at Stekkjarborg on the farm of Keldudalur in Hegrans, Northern Iceland discovered the remnants of a small-scale iron smelting site

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

dating to post-1104, well after deforestation. The smelting site represents a specific small-scale production activity being conducted in a marginal area for domestic use. The scale of the activity suggests independent production and usage while the evidence of limited activities suggests an interconnected production network. This paper will examine how such a site managed key natural resources for production activities in marginal ecological and economic contexts.

Zelenetskaya Young, Tatiana (Temple University)

[30] *Architecture as an Expression of Maya Political Organization in the Cochuh Region, Quintana Roo during the Early Terminal Classic: The Perspective from Non-primary Sites*

Political leaders among the ancient Maya were actors performing for an audience with the intent to receive the people's support to govern. These actors often used specific architecture as stages for their performances; therefore, this architecture serves as a source of information on various aspects of political organization. Architecture embodies political symbolism and has the potential to communicate type of political institution. This paper examines the distribution of architecture that embodies the apparatus of rulership in twenty sites in the Cochuh Region occupied during the Early Terminal Classic or Florescence Phase (A.D. 750–900). The data are compared to the different expectations derived from three political models that vary in the degree of centralization of rulership present. I argue that some types of political organizations would be only visible through the examination of secondary sites and their satellites.

Zeng, Lingyi (Yale University)

[177] *SEM-EDS Analysis of Ceramics from the Mongol Empire*

I will use scanning electron microscope with an energy dispersive X-ray spectrometer (SEM-EDS) to investigate both elemental compositions and mineral microstructures of ceramics from the Mongol Empire. I will analyze and compare sherds from multiple contexts, including ceramic production centers, burials and residential areas to acquire qualitative and quantitative data on porcelain bodies, glazes, and pigments with the SEM-EDS technique. A high degree of similarities in chemical compositions and mineral structures of samples from different areas would suggest a single or very few production centers. I also expect official wares and civilian wares were made with different sources and recipes of raw materials, which will be indicated by comparing the compositions of sherds using SEM-EDS. My research will not only focus on how objects were produced, consumed and exchanged, but also attempt to understand the underlying sociopolitical factors that affected these processes over time and space.

Zhang, Chengrui (Harvard University) and Rowan Flad (Harvard University)

[177] *A Song Dynasty Roof Tile Kiln at Qijiaping: Gender and Pyrotechnology in Medieval China*

During the 2016 and 2017 excavations at the site of Qijiaping, Guanghe, Gansu, China, the Tao River Archaeological Project excavated a large intact kiln that turned out to be a Song Dynasty roof tile kiln. The kiln is well preserved, and the first of its kind reported in an archaeological excavation in this region. Inside the flues of the kiln were many objects, deliberately disposed of, presumably at the moment when the kiln was put out of commission. Among these objects is a stone phallus in the central flue, potentially reflecting a gendered process of manufacturing associated with this kiln or its decommissioning. This paper aims to explore the role of gender in ceramic production and its association with pyrotechnology in medieval China within a broad social context.

Zhang, Li (Zhengzhou University)

[24] *The Landscape of China's Participation in the Bronze Age Eurasian Network*

In the last decade, much has been learned about the network of interactions in Bronze Age Eurasia, and the importance of the steppe pastoralists in the creation of this network. However, the mechanisms that enabled societies in ancient China (both those bordering on and distant from the steppe) to participate in the Bronze Age Eurasian arena are still poorly understood. Based on the latest archaeological discoveries in China, this article focuses on the participation of four regions of ancient China: the Ejin River Transfer Zone (ERTZ); the western Hexi corridor; central Inner Mongolia; and the middle Yellow River valley. The article analyzes all significant innovations, materials, and technologies transmitted via the Eurasian network and adopted in ancient China, with an emphasis on metallurgy and the variations in the mechanism of its adoption across different societies during the Bronze Age. Through analysis and comparison, this paper argues that the participation of different societies of ancient China in the Bronze Age Eurasian network can best be understood in the local and regional contexts, which were deeply embedded in their natural and cultural landscapes, rather than as the result of the pull from the steppe pastoralists alone.

Zhang, Zhengwei (Department of Anthropology, Washington University in St. Louis)

[336] *The Making of Agro-pastoral Landscape of the Tibetan Plateau: A Zooarchaeological Perspective*

The vertical ingredient of the Tibetan Plateau plays a unique role in making of the highland agro-pastoral landscape. We divide the Tibetan Plateau into three eco-altitudinal zones: areas below 3,000 m.a.s.l.; areas between 3,000 and 4,200 m.a.s.l.; and areas above 4,200 m.a.s.l. Today, pastoralists and farmers utilize different faunal and floral taxa in the three zones, partly as risk aversion strategies. In this paper, I review the zooarchaeological evidence dated between 6,000 and 1,000 BP from the Tibetan Plateau to explore the chronology of the expansion of animal husbandry to the highland plateau.

By the late second millennium BC, herd animals such as horse, goat, and cattle began to appear in regions below 3000 m.a.s.l. It is not until the first millennium AD, herding animals expanded to regions above 4,200 m.a.s.l.

[174] *Tracing Late Quaternary Highland-Dryland Social Connectivity in Southern Africa with Ostrich Eggshell Bead Strontium Values: Preliminary Results*

Humans have frequented southern Africa's highest reaches—Lesotho's Maloti-Drakensberg Mountains—for ≥90,000 years. As with many high mountain systems worldwide, the Maloti-Drakensberg cast a rainshadow over closely neighboring arid lowlands (the eastern Karoo Desert). Based on previous archaeological and paleoenvironmental work in highland Lesotho, researchers have posited that source populations for human dispersals into the mountain zone often originated in the Karoo, particularly during phases of enhanced regional aridity or climatic instability. Lesotho's mid/high-

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

altitude temperate grasslands may have been attractive to lowland desert foragers because they offer topographical resource diversity and stable supplies of key resources. Such dynamics would have necessitated the existence and maintenance of strong cultural linkages between these ecologically contrasting macro-regions. To begin testing these hypotheses, we are conducting strontium isotope analyses of ostrich eggshell beads recovered from Sehonghong, a highland Lesotho rock shelter with a record of human occupation stretching from the late Holocene to early Marine Isotope Stage 3, and constructing terrestrial strontium isoscapes in both regions. This paper presents our preliminary results, which demonstrate the existence and persistence of highland-dryland exchange networks and hold implications for tracing the development of social strategies for long-term survival in the southern African interior.

[284] *Archaeological Evidence of Multiple Domestication of Rice*

The first domestication of rice in the Yangtze river valley in China is recently informed by genetic, archaeological, palaeoenvironmental, and archaeobotanical data. Archaeological sites where rice remains between 10000 and 4000 BP have been unearthed are concentrated in the middle and the lower Yangtze valley, a distance of over 1000 km apart. This study focuses on the morphological and histological features of spikelet bases of rice between 8300 and 4800 BP found in the Liyang Plain of the middle Yangtze valley, comparing them with those found in the archaeological sites of the lower Yangtze valley in Zhejiang province. The results showed that there was a clear and complete domestication process in the Liyang Plain, with the domesticated ratios higher than those of the lower Yangtze Valley in the same times. The results indicated that there were separate domestication processes for rice in the middle and lower Yangtze River, even though rice inhabiting the two areas were the same species of the *Oryza* genus. The study suggests that there might have been multiple domestication processes of the same crop in similar ecological niches in the early Holocene.

[154] *pXRF in the Colca Valley: Experimenting with a Nondestructive Chemical Discrimination of Ceramic Fragments*

The choice of clay and pigment sources for ceramic production in the Andes has the potential to convey complex information about the resilience and persistence of Inca social structure in the Colca Valley throughout the imposition of Spanish imperialism. Prior to the Spanish invasion, ceramics in the Colca Valley were likely primarily produced by a handful of specialized communities which would have widely distributed their products. It is therefore expected that there would be a standardization of clay sources and production methods producing ceramics with similarly standardized chemical signatures. It has been hypothesized that during the Spanish conquest of Colca Valley the resulting political and social transformations disrupted these patterns of production and distribution, resulting in the use of more diverse and perhaps more local clay sources and production techniques. This disruption was therefore expected to result in ceramics with similarly less standardized chemical signatures. Finally, it is an outstanding question whether the traditional patterns of ceramic production and distribution were re-established following the imposition of colonial rule, or new patterns were developed. This study hopes to test each these dynamics through the nondestructive analysis of ceramics excavated from Machu Llacta using a Bruker Tracer Vi handheld pXRF unit.

[76] *Examining the Bread-Basket Model: Puuc Intra and Inter-site Diversity in Plant Foods*

The Puuc mountains in the northwestern Maya lowlands have proven themselves to be double-faced in regard to pre-Columbian human settlement. On one side, the valleys exhibit the region's most fertile soils. On the other hand, rainfall is scarce and access to the underground water table is comparatively difficult. Nonetheless, authors such as Smyth (1991) have long suggested that the Puuc represented some of the bread-basket for the wider northwestern lowlands. As part of a broader study, in this paper I will present microbotanical data gathered from food consumption areas corresponding to different buildings located at the sites of Kabah, Sayil, and Oxkintok. Starch grain analyses are particularly helpful when evaluating the dietary contributions of carbohydrate-rich staple foods. Among the pre-Columbian Maya this list includes, of course, maize and beans. However, in the past different tubers as well as tree crops have been proposed as supplementary staples or famine foods.

[309] *Did You Sleep Well?—The Body, the Senses and the Ancient Egyptian Headrest*

This paper explores the possibility to extract information about sensory experiences inherent in the material culture of ancient Egypt which are often overlooked due to the difficulty to track them in the material. By implementing new intellectual frameworks like New Materialism and the consequent application of methodologies from archaeology and anthropology we gain insight in the actions of ancient bodies. Taking inspiration from Latour's actants (2005), Barad's agential realism (2007) and Bennett's thing power (2010)—relating the potential of agency to materials and objects in human lives—the study discusses the physical relationship of material objects and the human body. With the additional help of experimental and experiential archaeology as well the focus on hitherto neglected objects we not only can bring the objects but also senses in the past to life.

INDIVIDUAL ABSTRACTS OF THE SAA 83RD ANNUAL MEETING

This is explored using unpublished headrests from Cyfarthfa Castle Museum by looking on the intersection of bodies with the material that also could be interpreted as inter-material communication. Impressions of fabric on their wooden surface are presumably the imprint of bedding intended to ensure comfortable sleep telling us about the sensual experience using these artefacts. The contact between skin and rough wood needed to be alleviated.

[140] *Ethno-archaeometry of Ochre Mineral Pigment Extraction, Transport, and Use in the Kenya Rift Valley*

Ochre occurs in African archaeological sites from the later Middle Pleistocene to the ethnographic present. Ochre is used worldwide for symbolic and functional purposes, and is often considered to be evidence for symbolic behavior by cognitively modern Paleolithic humans. Geochemical provenience analysis, complemented by ethnographic studies of ochre source exploitation, transport, and use, can elucidate whether culturally mediated source exploitation differs significantly from a least-cost energetics (closest source) model of source use. In 2015–2017 we sampled 53 ochre deposits in the Kenya Rift Valley, guided by Maasai, Samburu, and Dorobo informants. The strontium isotope ratio (87/86 Sr) and elemental composition of these sources were characterized using Electron Probe MicroAnalysis and Inductively Coupled Plasma-Mass Spectrometry. Our results show that the Provenience Postulate is upheld at the regional scale by 87/86 Sr ratios and at the local scale by elemental composition, facilitating sourcing of cultural ochre. Analysis of ochre recovered from the Elmenteitan Neolithic cremation burial site of Njoro River Cave shows that the pigment is derived from two sources 110 and 150 km to the south, despite the availability of high quality ochre at deposits 20–35 km away and nearby the main sources of obsidian artifacts found at this site.

[167] *The Inequalities of Households—Cemetery Management and Social Change in Early Medieval Iceland*

In AD 1000 Icelanders adopted Christianity in an apparently swift and embracing fashion. The new tradition was implemented by discrete households that built private churches and cemeteries on their farms. These cemeteries were in use until the beginning of the 12th century and interred were all individuals of the household, men and women, the old and the young, householders and servants. The establishment, management, and abandonment sequences of these cemeteries reflect the religious, social, and political transformations that took place at both societal and household levels during the 11th century. A number of these cemeteries have been excavated in Skagafljörður, North Iceland in recent years. This paper examines the resulting funerary and osteological data for evidence of social hierarchies and changes in household structure during the time of their use. The osteological data points to a population subjected to marginal environmental constraints, but the funerary data indicates a people well versed in contemporary European traditions. The internal cemetery management, such as the positioning of burials and the selective removal of individuals from graves, is suggestive of internal social divisions that may infer social inequalities at the wider societal level.

[100] *Mining, Extractive Metallurgy and Imperialism in the Inka Empire*

The Inka empire directed significant resources and labor towards the extraction of metals from the provinces. Using the examples of Porco (silver), Viña del Cerro (copper) and the Tarapacá Valley (copper and silver), this poster explores Inka strategies for obtaining metallurgical wealth. These case studies show that, as suggested by ethnohistoric sources, large-scale silver extraction was directly overseen by the state. In contrast to models of more indirect state involvement typically proposed for copper production, these case studies demonstrate that the Inka actively invested in expanding production of this metal, despite the fact that it was not destined for use in the imperial heartland. I propose several ways that the production of silver and copper—both the sequence of activities and interactions implicated in its manufacture and the metals themselves—enmeshed local people in the relationships of hierarchy, obligation, and reciprocity that constituted them as subjects of the Inka empire.

[86] *Eating and Drinking in the Medieval Castle of San Giuliano (Province of Lazio, Italy)*

The medieval Italian settlement pattern was transformed from the 8th—12th centuries as people moved to inhabit defensible hilltops. The precise timing and reasons for this historical process, known as *incastellamento*, are not well understood. We initiated the San Giuliano Archaeological Research Project to provide high-resolution archaeological data for understanding this phenomenon. Two seasons of survey and excavation atop the San Giuliano plateau have identified walls and structures comprising a fortified castle dating to the *incastellamento* period. In this paper, we present preliminary analyses of the food consumption practices evidenced in and around a large hall in use approximately AD 900–1200 in the center of the castle zone. Ceramic and glassware analyses provide insight into the medieval inhabitants' food consumption activities. The vessel analyses are complemented by an investigation of the faunal remains obtained from two specific contexts: 1) refuse from wall support trenches excavated into bedrock; and 2) a large subterranean feature used as a granary before serving as a place of refuse disposal. These data shed light on the economy and feasting practices of the medieval people within a typical small Italian castle in an area of Lazio where the process of *incastellamento* has been understudied.

[313] *Steering through North American Archaeology: Reflections on the Effectiveness of an Open Textbook Steering Committee*

As an open educational resource, this textbook has been designed to incorporate the perspectives and expertise of a variety of different scholars and stakeholders from across North America. Early in the process, a 'steering committee' was established to try and ensure balanced coverage, maintain a relatively consistent voice, and iron out any difficulties that may arise. The steering committee has also been responsible for some of the small but important details like hunting down copyrights, identifying reviewers, and initial editing. This paper evaluates the effectiveness of the steering committee at this point, considering our successes, our disappointments, and our future challenges. We share our experiences in the hope that this discussion will be useful to others who are currently engaged in (or thinking about introducing) a similar project and in order to contribute to a larger conversation about the usefulness of open educational resources in archaeology.

[252] *Monumental Architecture of Yaxha and Nakum (Northeastern Guatemala) during the Middle and Late Preclassic Periods*

Yaxha and Nakum are two important Maya centers located in northeastern part of Guatemala. Recent research carried out by different projects at both sites indicate that during the Preclassic period Yaxha and Nakum rose to power and became important polities that had many examples of monumental architecture such as E-Groups, triadic complexes, ballcourts, causeways and other constructions. The scale of monumental architecture documented at Yaxha indicates that it was one of the largest Late Preclassic cities in the Southern Maya Lowlands which must have dominated politically and economically over other neighboring centers. Nakum—although smaller in its monumentality—showed examples of various public constructions from the same epoch, some of which were embellished with beautifully rendered stucco friezes. The aim of this paper is to show the evolution of monumental architecture in both sites from its beginning in the early Middle Preclassic until the Terminal Preclassic or Protoclassic period when many Maya centers—including a large polity of El Mirador—collapsed. We will also address the subject of political organization in the Yaxha region during the Preclassic times.
